Mac OS X Server 1.0: Opening File With Long Name Disconnects Clients

On a network containing Mac OS clients and a Mac OS X Server 1.0 running Apple File Services, opening certain files on the Mac OS X Server disconnects all clients who are connected through Apple File Services.
This article has been archived and is no longer updated by Apple.
Apple has determined that all Apple File Services connections to the server are terminated if a client tries to open or get info on a file that has a filename longer than 31 characters.

All connected clients receive the message, "The file server's connection has unexpectedly closed down." Clients connected over TCP disconnect immediately, while connections over AppleTalk timeout after two minutes. Once disconnected, clients can immediately reconnect to the server.

Until a solution to this condition is reached, you should avoid sharing files with names longer than 31 characters with Apple File Services.

Mac OS clients are not able to create filenames longer than 31 characters. However, they can be created at the Mac OS X Server computer or copied over from other file services running on the server.

Sherlock: Search Internet Tab Dimmed

This article explains why Sherlock's Search Internet tab may be dimmed, leaving you unable to search the Internet, and provides the solution.
This article has been archived and is no longer updated by Apple.
Sherlock requires that certain system software components be installed in order to search the Internet. If one or more pieces are disabled, missing or damaged, then you may need to enable, or reinstall them.

QuickTime 3 or later is required for all versions of Sherlock. Mac OS 8.6 installs URLAccess, and it is required for Sherlock to run on Mac OS 8.6 or later.

When Sherlock opens it verifies that necessary files are present for each Mac OS environment. If a necessary file is not present, Sherlock issues a dialog indicating what needed file is missing. See Figure 1.

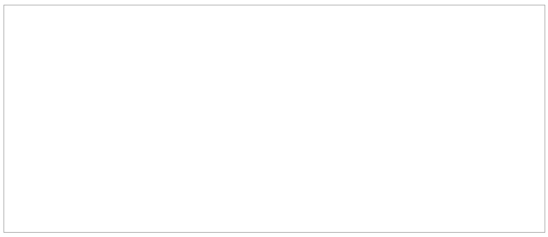

Figure 1 Sherlock dialog box.

If you click the OK button, Sherlock continues to display error dialogs when it opens if the required software components are missing. If you click the Don't Show Again button, Sherlock opens without any notification, and the Search Internet feature are unavailable. Sherlock can still find by content, and find files.

If Sherlock's error messaging has been turned off, you may be uncertain which files are missing. To restore Sherlock to reinstate the error dialog when opened, drag the Sherlock Preferences file to the Trash. It can be found in the Preferences folder of the System Folder. When Sherlock is opened again, it issues error messages by default.

Use the Extensions Manager to enable the necessary files for Sherlock and then restart, to be able to use Search Internet.

Mac OS: Installing Older Mac OS Component After Updating System Software or Firmware

When a computer has one version of Mac OS installed (or its firmware has been updated) and a software component from an earlier version of Mac OS is installed (such as from Mac OS software installer disc), the computer may not work properly or may not start up.

This article has been archived and is no longer updated by Apple.

System Software

Your Mac OS System Folder may no longer be valid because your System file and other crucial items from the two versions of Mac OS have become mismatched. To fix this, start up from another volume (such as your Software Installer disc) and run the update again to re-synchronize the items.

Sometimes a Mac OS installer system software discs opens an additional installer after the system software installation is complete. This extra installer may replace certain system files such as the Mac OS ROM, System Resources and System file with versions intended for use with its (older version) of Mac OS. Installing any older Mac OS item from its installer still causes this extra installer to open. Unfortunately, this additional installer does not check to see if a newer item is installed and instead replaces the items that were updated in the newer version of Mac OS already installed on the hard disk. Although these items are inadvertently replaced with older versions, the version of the Finder and other items installed are not replaced, so you end up with a non-functioning System Folder.

If you have a Mac OS full install or update disc, you can start up from it and simply install the update to repair the System Folder. If you downloaded the update and it is still on your hard disk, you can start up from the older Mac OS disc and run the updater from the hard disk to repair the System Folder, too.

Firmware

The discussion above applies to firmware updates, too. If a firmware update has been installed, using an older Mac OS system software installer may cause the same difficulties.

Mac OS 8.6: Folders Deleted by Installer

The following is a list of folders that are automatically removed as a result of installing Mac OS 8.6.
This article has been archived and is no longer updated by Apple.
Important: The colon is not part of the name, but is used to separate names of different folders. In the first example below, the AppleScript folder is inside the Apple Extras folder on the volume named "Macintosh HD" (or whatever your hard disk may be named).

- Macintosh HD : Apple Extras : AppleScript
- Macintosh HD : Apple Extras : Monitors Extras : Monitors Extras Folder
- Macintosh HD : Apple Extras : QuickDraw 3D Extras : QuickDraw 3D 1.5.4 Folder
- Macintosh HD : Mac OS Read Me Files : Open Transport Information

One potential concern is that if you are storing other documents in the folders listed above, you are not given a warning upon deletion.

Special AppleScript Information
With Mac OS 8.1 and earlier, the AppleScript folder inside the Apple Extras folder had a (TM) (trademark symbol) in the name. Beginning with Mac OS 8.5, the AppleScript folder inside the Apple Extras folder does not include a (TM). If you upgraded from previous versions of the OS, it may be possible that you have two AppleScript folders inside the Apple Extras folder: one named "AppleScript" and one named "AppleScript(TM)" (with trademark symbol). The Mac OS 8.6 installer deletes the folder named "AppleScript(TM)" (with trademark symbol) if it is present. If you have AppleScript documents or other documents you've created, please move them to another location before installing Mac OS 8.6.

Mac OS Setup Assistant: Cannot Print After Changing Zone

After using the AppleTalk control panel to change the zone in which my Macintosh resides, the Macintosh now displays this error when attempting to print to my Desktop Printer:

The document "xx" failed to print on the printer "yy" because the requested printer could not be found. Cancel Job. Stop Queue. Try Again."

Additional observations: the printer does appear in the Chooser but there is no printer icon adjacent to its name.
This article has been archived and is no longer updated by Apple.
This error appears when these three conditions are all true:

1. You used Mac OS Setup Assistant to select your Desktop printer (any version of the assistant up to and including Mac OS 8.6).
2. Your computer is on a network that has multiple zones you can register it in.
3. From the AppleTalk control panel you've selected a zone for your Macintosh other than the one your printer is located in.

Some possible workarounds include:

- From the AppleTalk control panel reselect the original zone your Macintosh was located in, or
- Select and setup the printer again, only this time through the Chooser, then drag the first Desktop Printer created by Mac OS Setup Assistant to the Trash.

Note regarding the scenario above:

- This assumes that you have different zones available to register in on the network cable segment your Macintosh is connected to (this is a different concept than zones listed in the Chooser).
- To view the different zones your Macintosh can register in, open the AppleTalk Control Panel. The available zones you may register your Macintosh in are displayed in the "Current zone" scroll bar.

QuickTime: "VISEData" or "viseicat.idx" Alerts

This document includes tips to try when "VISEData" or "viseicat.idx" alerts appear when you install QuickTime.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to install QuickTime, an alert box appears with one of these messages:

"An error occurred trying to download the file VISEData"

"The file 'viseicat.idx' couldn't be downloaded."

Solution

- If the alert box appears while you're installing QuickTime, try installing again. The installer will begin where it left off when the alert box appeared.
- Macintosh users should be aware that this alert box can appear if certain system extensions or files are missing, or if there is an extensions conflict. Choose the "Mac OS All" extension set in the Extensions Manager control panel and restart the computer before attempting the installation. If any extensions that are part of this set are missing, reinstall the Mac OS before installing QuickTime.
- This alert can be caused by slow or dropped Internet connections. Be sure that your Internet connection is reliable and working correctly. You may also have more success installing QuickTime at times of lighter Internet traffic.
- In some cases the QuickTime Installer may try to use a proxy server. If your computer is not behind a firewall and doesn't need to use a proxy server, make sure the "Use Web Proxy" option is deselected.

These workarounds may not be effective for all users. You can also download the stand-alone QuickTime installer, which does not require an active Internet connection when it installs. See technical document 36507: "**QuickTime: How to Obtain the Stand-Alone Installer**".

Microsoft Windows Users

The stand-alone QuickTime installer for Windows is compressed as a ZIP archive. Once you have downloaded the file in this format, you must use a decompression program to 'UnZIP' the file. Programs such as PKWARE Inc.'s PKZIP, WinZIP, and others, can be used for this purpose. See article 75098: "**Software Downloads: Software Formats and Assistance**" for additional help and information on downloading.

Power Macintosh G3 All-in-one: Issue With ADB Powered Modems

Sometimes, when turning on a Power Macintosh G3 All-In-One with an Apple Desktop Bus (ADB) modem attached, the modem doesn't always initialize correctly. It may immediately go off hook, or not respond to AT commands, for example.

This article has been archived and is no longer updated by Apple.

Customers have reported this behavior with some, but not all, modems that receive power from the Apple Desktop Bus. Modems with a dedicated power supply that plugs into a wall outlet do not show this issue. If restarting or shutting down and starting up the computer does not seem to make a difference, then either resetting your modem (assuming it has a reset button) or disconnecting and reconnecting the modem's ADB cable should resolve the issue.

Control Strip: Listing Additional Display Resolutions

I've noticed that the Monitors and Sound control panel has a pull down to choose between recommended resolutions for my display and all available resolutions. Since I upgraded my system software though, my control strip only lists the recommended resolutions. Is there any way to list all available resolutions in the control strip?

This article has been archived and is no longer updated by Apple.

A change was made to the Monitor Resolution control strip and introduced in Display Software 1.6. The control strip now only lists the recommended resolutions by default. To force the control strip to list all available resolutions, hold down the control key while selecting the Monitor Resolution module from the control strip.

Mac OS 8.6: Computer Pauses Every Five Minutes On DHCP

It sometimes seems that my computer, which is running Mac OS 8.6, becomes unresponsive for about 25 seconds upon first IP activity and then every five minutes thereafter. It seems to occur under the following circumstances:

- TCP/IP set to Connect via "Ethernet"
- TCP/IP set to Configure via "Using DHCP Server"
- Computer is on a network that does not have active DHCP services, or computer is not attached to an Ethernet network

This article has been archived and is no longer updated by Apple.
When a DHCP server is not available and the computer is configured as above, the computer searches for a DHCP server until it times out in about 25 seconds. At this point, the computer will select a temporary IP address in the non-routable 169.254.x.x range. The computer will continue to look for a DHCP server every five minutes until a DHCP server is found. On this five minute interval, the computer becomes unresponsive for another 25 seconds or so.

This should not occur if your computer is on a TCP/IP network that provides IP addressing via DHCP. If it does occur, the server may be down or there may be a network issue. Consult your network administrator for further assistance.

Identification
If you are experiencing 'pauses' of about 25 seconds at five minute intervals, open the TCP/IP control panel. If TCP/IP is set to configure "Using DHCP Server" and the IP address is in the 169.254.x.x range, your computer is exhibiting the behavior described above.

Another cause of pausing on iMacs running Mac OS 8.6 is resolved by the iMac CD Update 1.0. Please refer to the following article for complete details on this specific issue: Article 58412: "**iMac: How To Resolve Intermittent Pause During Usage**".

Workarounds
If your computer is on a TCP/IP network that does not supply DHCP services, you should set TCP/IP to use an appropriate configuration method; for example, Configure Manually.

If your computer is temporarily not connected to a TCP/IP network that supplies DHCP services, make TCP/IP inactive or configure TCP/IP to connect using a different method; for example, Connect via AppleTalk (MacIP) or Connect via PPP.

In Mac OS 9 and later with Open Transport 2.6 and later, your computer will no longer pause when attempting to renew a DHCP lease.

Note: If you are unable to change the settings in the TCP/IP control panel, your network administrator may have locked the settings to prevent modification. Consult your network administrator if these settings are locked.

AppleShare IP 6.2: Can‘t Change Password on Secondary Server

Under AppleShare IP 6.2, I have User & Group sharing set up. When I am in the Chooser under AppleShare and try to change my password on a secondary server, I get a dialog that says "Your password could not be changed. Please try again or see your server administrator." I can log on just fine, and I know that my name and password are correct. What is happening?

This article has been archived and is no longer updated by Apple.

Passwords may only be changed on the primary server. As long as users can reach the primary server (either via AppleTalk or TCP/IP), they will be able to change their password there, despite whether they have access to any files on the primary server.

Until the user, on the secondary server, reaches its scheduled expiration time, users may continue to use their old passwords on the secondary server. If a user enters a new password on a secondary server before the current password expires, the login attempt will fail once. This will cause the secondary server to clear its cached entry for that user, and download a fresh one from the primary server. Therefore, when the user tries a second time with their new password, they will be able to log in with it.

iBook: How Programmable Function Keys Work

This article describes the programmable function key operation for iBook and the PowerBook (FireWire) computers.
This article has been archived and is no longer updated by Apple.
The programmable function keys were created to help simplify common, everyday tasks performed on the computer. You can use these keys to open a browser, an email application, or any other frequently used application or server by pressing a single key.

To set up a programmable function key, open the Keyboard control panel. Or, if the keys have not been programmed yet, simply pressing one of them brings up a dialog box that leads you to the Keyboard control panel. Apple has preprogrammed F1 through F6 with such common control functions as screen brightness, speaker volume, and so on. F7 through F12 can be programmed for your personal choices.

To help you identify what the function keys were programmed to do, Apple includes with iBook a variety of durable stickers with preselected icons. Once the keys are programmed, you can select the stickers that will best remind you of the assigned functions.

Note: The stickers should not be placed on the keycap itself, rather above them on the iBook case. To remove the sticker, use a fingernail or other non-abrasive tool to remove them and avoid scratching the plastics.

The function keys F1 through F12 can be easily reset to have primary functionality. Simply open the Keyboard control panel and select Options. Then check the box that says Use F1 through F12 as Function keys.

Note: Programmable function keys are not a feature of Mac OS X 10.0

AirPort Base Station: Description

This article describes the Apple AirPort Base Station.
This article has been archived and is no longer updated by Apple.
The AirPort Base Station is a dedicated hardware access point. It contains a 56 Kbps modem and a 10 BASE-T (10 MB per second) Ethernet port for connecting to a phone line, cable modem, DSL modem, or local area network for terrestrial Internet access. See Notes 1 and 2.

Up to ten AirPort enabled computers can communicate with an AirPort Base Station up to 50 m away. (More than ten users can connect to a base station, but ten users is the recommended limit based upon optimum performance.)

With AirPort-enabled computers and an AirPort Base Station, you can create a wireless network in your home, office, or classroom. You can also add more base stations to provide coverage for your entire location.

A. Modem port (RJ-11), **B.** AC power, **C.** 10 BASE-T Ethernet port (RJ-45)

Figure 1 AirPort Base Station

Notes:

1. Modem data speeds up to 56 Kbps. Download speeds vary with line conditions and your ISP's modem capabilities.
2. The AirPort Base Station will not function on a 100 BASE-T (100 MB per second) network.

3. Wireless Internet access requires an Internet service provider (fees may apply) and AirPort (or AirPort-compatible) wireless Ethernet card and base station. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access".**

Mac OS 8.6: Beep On Opening Chooser With Command-Option Keys Down

When holding down the Command and Option keys while opening the Chooser under Mac OS 8.5, 8.5.1 or 8.6, I notice that there is a slight pause and a beep that is not normally associated with opening the Chooser. I have heard that this resets the serial ports on computers that have them. Is this true?

This article has been archived and is no longer updated by Apple.

No, the serial ports are not reset. Mac OS 8.5, 8.5.1 and 8.6 include Chooser version 7.6.2. It is true that you will hear a System beep upon opening the Chooser with the Option and Command keys down, however, there are no parameters that are automatically reset. To reset serial ports on computers that have them, you will still need to reset the parameter memory (PRAM), by restarting the computer and holding down the Option, Command, 'P' and 'R' keys. For more information on resetting PRAM and NVRAM, please see the following Knowledge Base article:

Article 2238: "**Macintosh: How to Reset PRAM and NVRAM.**"

Mac OS: Using DOS/Windows ICC Profiles With ColorSync

I have a third-party display that I would like to use with the ColorSync color matching software on my Mac OS computer. The display came with ICC profiles in DOS/Windows format, but the ColorSync software does not seem to recognize these files when I drag install them onto my Mac. How do I properly install these files?

This article has been archived and is no longer updated by Apple.

Check with the manufacturer, possibly by visiting their website, to see if a Mac OS format ColorSync profile is already available for the device. If not, ColorSync uses the standard ICC (International Color Consortium) format to store its profiles, so you should be able to use a similar DOS/Windows formatted file by using the following instructions:

1. If the profile is part of a larger software install package, it may actually be in a compressed format. If this is the case, try installing the display software on a computer running Windows, then locate the individual decompressed profile on the Windows hard drive to transfer to the Mac OS computer. Stuffit Expander will also decompress zip (.zip) and self-extracting archives (.exe) of some DOS/Windows formats directly on the Mac if DropStuff is also installed. Stuffit Expander and DropStuff are included with Mac OS 8.x systems in the Internet Utilities folder.
2. You will need to convert the generic file to the ColorSync profile filetype in order for it to be properly recognized by the ColorSync control panel. You can do this with ResEdit, or third party utilities, but you can also do it with AppleScript. A sample AppleScript is included at the bottom of this article.
3. You will need to drag the converted ICC profile into the ColorSync profiles folder of your active System Folder. The profile should then show up in the ColorSync control panel listing.

To create an AppleScript which will convert generic ICC profiles to the ColorSync profile type, cut and paste the text below into the Script Editor application. Save the script as run only. Dragging files onto this application will convert them to recognized ColorSync profiles.

```
on open (these_items)

	tell application "Finder"
		activate
		repeat with this_item in these_items
			set the creator type of this_item to "sync"
			set the file type of this_item to "prof"
		end repeat
	end tell

end open
```

For more information about ColorSync, visit Apple's ColorSync website at http://www.apple.com/colorsync.

For more information about AppleScript, visit Apple's AppleScript website at http://www.apple.com/applescript.

Mac OS: Launcher - Displaying Custom Folder Icons On Buttons

When I drag folders with custom icons onto the Launcher, the Launcher buttons have generic folder icons. How can I get the custom folder icons to appear on the Launcher buttons?
This article has been archived and is no longer updated by Apple.
Here's a procedure to get custom folder icons to display on Launcher buttons.

1. Drag a folder(s) with a custom icon onto the Launcher.
2. Option-click on the category button to open the related Launcher Items subfolder. If you have no Launcher category buttons, open the Launcher Items folder within the System Folder.
3. Select all alias items in the folder that do not appear correctly in the Launcher.
4. Choose Get Info from the File menu for the selected items.
5. Close those Info Windows.
6. Go back to the Launcher window, and if the icons aren't correct yet, click another category button and back to get the Launcher to update. If you have no Launcher category buttons, close the Launcher and open it again.

The buttons should now show the correct icons.

AppleShare IP 5: Mail Server Does Not Forward Mail

In the AppleShare IP 5.x Mail Server, you have the option to forward mail that has an unknown host to another mail server. I turned this on, but the mail still isn't being forwarded. The mail server is queueing up messages that I want it to forward instead. What is wrong?
This article has been archived and is no longer updated by Apple.
The mail server has a specific definition of an unknown host. It considers a host unknown only if it looks up the DNS host name and receives an authoritative "Host does not exist."

Notice that a "Host does not exist" reply is not the same as receiving no reply on a query. Receiving no reply is considered a failed lookup and does not tell the server that the host definitely does not exist. It may be the case that the host actually does exist, but the lookup failed as a result of troubles with the DNS server, or because of network problems. For this reason, the mail server will hold the mail and attempt to look up the name again later.

Since the server must receive a response from a DNS server to consider a host unknown, this means that running the mail server without any DNS server will result in no mail being forwarded. One way to work around this is to run MacDNS for the mail server. For example, if your mail server is receiving mail for "company.com" and you want all such mail forwarded to another server, you can create a MacDNS zone file for "company.com" and create no hosts for that zone. Since MacDNS considers itself the authority for company.com, it will give a "Host does not exist" reply for any query about a host in the company.com domain. Keep in mind that this will also prevent the mail server from contacting any host in the company.com domain that actually does exist.

Power Macintosh G3 (Blue and White): Using Shift Key During Startup with Multiple Keyboards

This article describes how to disable extensions by holding down the shift key when there are two USB keyboards connected to the same computer.
This article has been archived and is no longer updated by Apple.
When the computer starts up, it detects devices on the USB chain. You can see the Caps Lock key light blink as each keyboard is detected. This initialization procedure takes slightly longer and the keyboard lights will blink more than once if more than one keyboard is connected.

If you hold down a key before the keyboard has been detected by the computer, it will not be recognized.

During startup, If you have this keyboard configuration, the Caps Lock light will blink a final time before the Happy Mac icon appears on the display. Hold down the Shift Key after the keyboard light blinks for the last time, before the Happy Mac icon.

This behavior also affects other keys held down during startup, including:

- Command key - disables Virtual Memory
- Space Bar - opens the Extensions Manager

Mac OS X Server: About QuickTime Streaming PlaylistBroadcaster

About QuickTime Streaming PlaylistBroadcaster

This document describes how to use PlaylistBroadcaster, a new feature available with QuickTime Streaming Server 1.0.2. PlaylistBroadcaster broadcasts QuickTime media, "movies," to a streaming server, such as QuickTime Streaming Server, which then reflects the media to clients. This lets you create a virtual radio station or TV broadcast that appears to users as a live broadcast of the media.

This document is installed in the `/System/Documentation/Administration/Services/QuickTimeStreaming/` directory.

For more information, see the QuickTime Streaming Server website.
This article has been archived and is no longer updated by Apple.
To specify the media to broadcast, you create a playlist. To specify how PlaylistBroadcaster broadcasts the media, you use a broadcast description file.

You can broadcast the media in the playlist once through the list sequentially, repeatedly through the list sequentially, or randomly.

If you broadcast the media randomly, you can specify a weight for each media file in the list. The weight, which is a number from 1 to 10, determines how often an item plays. Media files that are weighted as 10 play more often than media files weighted with lower numbers. In addition to using weights, you can prevent a media file from playing again until a specified number of other media files play.

To broadcast a playlist, you use the PlaylistBroadcaster command to start the process. The PlaylistBroadcaster process is a separate process from the QuickTime Streaming Server. Each process can broadcast the media from one playlist only. However, you can run the PlaylistBroadcaster process as many times as you want to broadcast other playlists.
As PlaylistBroadcaster broadcasts a playlist, you can have it keep a log of the media files it plays so you can keep track of what media is broadcast.

To use PlaylistBroadcaster, you need to do the following:

- prepare the QuickTime media for streaming
- prepare a reference media file
- create a playlist, which is a text file that specifies the QuickTime media to broadcast
- create a broadcast description file, which is a text file that specifies information for PlaylistBroadcaster

Once you're set up to use PlaylistBroadcaster, you can execute the PlaylistBroadcaster command to start the broadcast. If you broadcast the media repeatedly or randomly, you also use the PlaylistBroadcaster command to stop the broadcast.

Setting up to use PlaylistBroadcaster

Preparing the QuickTime media for streaming

You can use PlaylistBroadcaster to broadcast any media that the QuickTime Streaming Server is capable of streaming. For more information about the types of media you can stream, see Server Administration Help on your Mac OS X Server. To see the Help, open the Server Administration Help (named ServerAdministrationHelp.help), located in `/System/Documentation/Help`.

To prepare the media, you must do the following:

- Be sure all the media files contain compatible media types. For example, all audio tracks should use the same encoding and bit rate. All video tracks should also use the same encoding.
- Format the media in each file in the same way. For example, use the same frame size for each file that contains a video track.
- Be sure each item is a hinted QuickTime movie optimized for the server.

Note: To hint a QuickTime movie, you can export it from QuickTime Player and select one of the hinting options in the export dialog box. To optimize the movie for the server, click Options in the export dialog box. If the Hint Exporter Settings dialog box appears, select the Optimize Hints for Server option. If the Movie Settings dialog box appears, open the pop-up menu below Prepare for Internet Streaming and choose Hinted Streaming, then click Settings to see the Hint Exporter Settings dialog box.

Preparing a reference movie
PlaylistBroadcaster requires that you specify a reference movie in the broadcast description file. This is a QuickTime hinted movie that contains the same types of tracks and encodings used in the actual media files. Normally, you can specify any of the media files included in the playlist because

they are the same, although you can author a reference movie.

Creating the playlist file
The playlist text file specifies the media to use in the broadcast. To create a playlist, you can use any text editor, such as TextEdit on the Mac OS X Server, to type the information for each item included in the playlist. Then, save the text file where you can locate it on your server.

Keep these points in mind about the playlist file:

- You must begin the playlist with *PLAY-LIST*.
- The list can consist of individual media files or other playlist files.
- To specify a media file or another playlist file, provide the complete or relative pathname to the file.
- To specify another playlist, precede the pathname with the "+" symbol.
- For individual media files, the list should include a weight. The weight is a number from 1 to 10. Items with a weight of 10 play more often than those with lower numbers. If you don't specify a weight, PlayList Broadcaster assigns 10 as the weight.

Here's an example of a playlist file containing individual files with weights and another playlist:

```
*PLAY-LIST*
# Lines beginning with "#" are comments
# individual media files weight (1-10)
#--------------------------------------
/music/jazz/take5.mov 2
/music/rock/freebird.mov 9
/music/reggae/onedrop.mov 5

# path to another playlist
#--------------------------------------
+ /music/classical/playlist.txt

# relative path to another playlist
#--------------------------------------
+ music/funk/funkplist.txt

# individual media file with space
#--------------------------------------
"/music/jazz/ice cream love.mov" 9
```

Note: If the pathnames include spaces, enclose the pathname in quotation marks.

You can change a playlist file after starting to broadcast it. However, you must stop and restart the broadcast to use the changes.

Creating the broadcast description file
The broadcast description file is a text file that specifies how the media should be broadcast, the playlist file, the IP address of the QuickTime Streaming Server, and other information about the broadcast.

To create a broadcast description file, you can use any text editor, such as TextEdit on the Mac OS X Server, to type the information needed to broadcast the playlist. Then, save the text file where you can locate it on your server.

The information you need to enter in the broadcast file includes the following:
Σ Playlist (playlist_file): The complete or relative pathname of the playlist file you want to broadcast.
Σ Play Mode (play_mode): The method you want to use to broadcast the media files. Specify one of three modes:

sequential
sequential_looped
weighted_random

If you specify sequential or sequential_looped, PlaylistBroadcaster broadcasts the media in the order it appears in the list.

If you specify weighted_random, PlaylistBroadcaster broadcasts the media in random order using the specified weights to broadcast how often an item plays. It continues to broadcast the media until you stop the PlaylistBroadcaster process.

Σ Destination (destination_ip_address): The IP address of the QuickTime Streaming Server you are using to broadcast the media. The default destination is the QuickTime Streaming Server on the same computer as the PlaylistBroadcaster.

Σ Destination Base Port (destination_base_port): This specifies the base port number for the broadcast, which must be an even number. If you do

not specify a base port, PlaylistBroadcaster uses the default port (5004).

Each track of the media you are broadcasting requires two ports. If the media contains several tracks (for example, video and sound), PlaylistBroadcaster uses the destination base port as the starting port number, then assigns an incremental port number to other tracks automatically.

Important: Each track of each broadcast must use a different port number. If you are streaming more than one broadcast of multi-track media from your QuickTime Streaming Server, be sure to assign destination base ports so that tracks do not play on the same port.

For example, if you use the default destination base port for a broadcast in which the media has three tracks (video, audio, and text), then the broadcast will use ports 5004 through 5009 (two for each track). If you want to broadcast another stream, then you should set the destination base port of the second stream to at least 5010.

Σ Recent Movies List Size (recent_movies_list_size): If you broadcast a playlist using the weighted_random Play Mode, you can use this parameter to specify the minimum number of files to broadcast before allowing a file to play again.

By default this parameter is zero (0), so that all the media files play randomly based only on the weight you have assigned to each one.

If you set the parameter to a value greater than zero, then after a media file is broadcast, it will not be available to play again until the number of files specified by the parameter have played. Of course, it may not play again immediately because PlaylistBroadcaster will broadcast any available media randomly.

Note: Be sure to set this parameter to a number less than the number of media files in the playlist. If you set it to a number equal to or greater than the number of media files in the playlist, the broadcast will play each media file once then stop. If you perform a preflight check, you will see a message about this problem.

Σ SDP File (sdp_file): The complete or relative pathname of an SDP file in the movies folder used by the QuickTime Streaming Server. You must specify an SDP file. If the SDP file you specify doesn't exist in the location, PlaylistBroadcaster creates one.

Important: If you stop a broadcast and change the broadcast description file, be sure to move the SDP file from the QuickTime Streaming Server movies folder before you restart the broadcast.

Σ SDP Reference Movie (sdp_reference_movie): The complete or relative pathname of the reference movie, which can be one of the media files you are broadcasting.

Σ Logging (logging): You use this parameter to specify whether or not to keep a log. It can have one of two values:

enabled
disabled

If you enable logging, PlaylistBroadcaster records information about the broadcast in the log file, including error messages. For more information, see "Using the Log File" and "Understanding Error Messages" later in this document.

Σ Log File (log_file): The complete or relative pathname of the log file. If you enable logging but do not specify a log file, then PlaylistBroadcaster creates a log file with the name of the broadcast description file followed by ".log" in the same directory as the broadcast description file.

Here's an example of the items for a broadcast file:

```
playlist_file /server/local/media/lists/playlist1
play_mode weighted_random
sdp_reference_movie /music/jazz/take5.mov
destination_ip_address 12.123.123.123
destination_base_port 5004
recent_movies_list_size 10
sdp_file /server/QTSS/movies/playlist1.sdp
logging enabled
log_file /server/local/playlistlogs
```

Starting and stopping PlaylistBroadcaster

To start, you use the PlaylistBroadcaster command. You also use the command to list existing playlist broadcasts and to stop broadcasting a playlist.

Using preflight to check your broadcast

If the playlist you are broadcasting includes a large number of media files, you may want to use the following command:

```
PlaylistBroadcaster broadcast_filepath -preflight
```

Preflight causes PlaylistBroadcaster to determine if each media file in the playlist can be broadcast. Preflight does not start the broadcast.

After performing the preflight check, PlaylistBroadcaster displays information about the broadcast description file, including information about these types of problems:

- if there is a problem with a media file included in the playlist file
- if it can't find the playlist file
- if there's a problem with the broadcast description file

Note: If you perform a preflight check, PlaylistBroadcaster creates an SDP file, if the file doesn't exist already. If you change the broadcast description file, be sure to move the SDP file from the QuickTime Streaming Server movie folder before restarting the broadcast..

Starting to broadcast a playlist
To start broadcasting a playlist, type the following command in a Terminal window:

```
PlaylistBroadcaster broadcast_filepath
```

where the "broadcast_filepath" is the complete or relative pathname of the broadcast description file that describes the playlist you want to broadcast.

When you start PlaylistBroadcaster, it creates the SDP file, if the file doesn't exist already. PlaylistBroadcaster also creates a playlist in memory that lists all the media files in the playlist and in any playlist files included in the playlist.

Note: If you change a playlist file used by a broadcast, you must start and restart the broadcast to use the changes. If you change the broadcast description file, you must stop the broadcast, move the SDP file from the QuickTime Streaming Server movie folder, then restart the broadcast.

Listing broadcasts
To stop a broadcast, you need to specify an index number. If you are broadcasting more than one playlist, you need the index number of the playlist broadcast. To see the index number of the playlists that are broadcasting, type the following command in a Terminal window:

```
PlaylistBroadcaster -list
```

This lists all the PlaylistBroadcaster broadcasts that are currently running. Here's an example:

```
[ 1] JazzBroadcast.txt; pid: 12318
[ 2] RockBroadcast.txt; pid: 12389
[ 3] ClassicBroadcast.txt; pid: 12730
```

The number at the beginning of each item is the broadcast's index.

Stopping a playlist broadcast
If you are broadcasting one playlist and want to stop it, then type the following command in a Terminal window:

```
PlaylistBroadcaster -stop 1
```

If you are broadcasting more than one playlist, list the broadcasts that are currently playing, then type the following command in a Terminal window:

```
PlaylistBroadcaster -stop broadcast_index
```

where "broadcast_index" is the index of the broadcast you want to stop.

Restarting a playlist broadcast
You can restart a broadcast using the PlaylistBroadcaster command. If you restart a broadcast, PlaylistBroadcaster uses the SDP file it created when you started the broadcast previously. If you make changes to the broadcast description file, be sure to move the SDP file from the QuickTime Streaming Server movie folder before restarting the broadcast.

Seeing information about PlaylistBroadcaster

You can use the following command to see information about PlaylistBroadcaster, such as the version number of the program:

```
PlaylistBroadcaster -help
```

Connecting to the broadcast

To connect to the broadcast, users need client software that can play QuickTime media, such as the QuickTime Player. They can also use Internet browser programs, such as Microsoft Internet Explorer or Netscape Communicator, if they have the QuickTime Plug-in installed. For best results, users should have the latest version of the QuickTime software installed on their computers.

You will need to provide users with the URL for the QuickTime Streaming Server and the SDP file that connects to the playlist broadcast.

Solving problems with PlaylistBroadcaster

The media in the playlist is not being broadcast:
Use ProcessViewer to be sure the PlaylistBroadcaster process is running. If it is and the media is not being broadcast, stop the broadcast using the PlaylistBroadcaster command, move the SDP file for the broadcast from the QuickTime Streaming Server movie folder, then restart the broadcast.

Be sure the broadcast description file is correct for all the parameters correctly. If you change the broadcast description file, stop the broadcast, move the SDP file for the broadcast, then restart.

The media in the playlist is not broadcast randomly:
Be sure the broadcast description file specifies that the play_mode parameter is weighted_random.

The media plays once then stops:
Be sure the broadcast description file specifies that the play_mode parameter is sequential_looped or weighted_random.

If you broadcast the playlist as weighted_random and set the Recent Movies List Size (recent_movies_list_size), be sure the number is less than the number of media files in the playlist.

Some media in the playlist is not being played:
Check the weight you have assigned to each media file in the playlist. If you change the playlist, be sure to stop and restart the broadcast to use the changes.

Check the settings for the Recent Movies List Size parameter in the broadcast description file. If you change the broadcast description file, be sure to stop the broadcast, move the SDP file for the broadcast from the QuickTime Streaming Server movie folder, then start the broadcast again.

The media isn't presented correctly:
Be sure the content, format, and encoding of the media is the same for all files in the playlist. Also, be sure users have the latest version of the QuickTime software installed on their computers.

The presentation of the media is slow:
Be sure each media file is a hinted movie optimized for the server.

A user cannot connect to the broadcast:
Be sure the user's computer has QuickTime 4.0 or later installed. If the user is connecting to the broadcast using a Web browser, be sure the QuickTime 4 Plug-in is installed correctly for the browser.

If the correct software is installed, be sure the user has the correct URL.

Be sure the broadcast file has the correct IP address, base port, and pathname for the SDP file.

A user gets a "404" error in a Web browser but is using the correct URL:
Be sure that the destination IP address is correct in the broadcast description file.

A user's computer crashes while streaming a playlist that includes media files with video tracks:
Be sure all the video tracks in the media files use the same frame size.

Using the log file

If you enable logging, PlaylistBroadcaster records information about the broadcast. The log file can help you determine problems that occur during the broadcast, as well as maintain records of the media file you broadcast.
A log file contains this information:

- the date and time the broadcast started

- the date and time each media file played, the pathname of the media file, and if any errors occur a description of the problem
- the date and time the broadcast stopped

Using the error messages

If it detects a problem during a preflight check, PlaylistBroadcaster displays an error message. It also includes a description of any problems that occur in the log file, if you enable logging.

Most of the error messages are self-explanatory. Following is a description of a few of the messages.

Permission denied to access the broadcast description file. Read access required. (path: <pathname>, errno: <error number>)
PlaylistBroadcaster was unable to open the file with Read/Write privileges.

Unable to access the broadcast description file. (path: <pathname>, errno: <error number>)
PlaylistBroadcaster was unable to open the file, but it could not determine a specific reason.

Error reading the broadcast description file "<pathname>." (bad format or missing file)
PlaylistBroadcaster cannot read lines from the broadcast description file.

PlaylistBroadcaster set up failed: There are no movies to play.
PlaylistBroadcaster found no media files in the playlist.

Warning, movie tracks do not match SDP file. Movie: <pathname>
Some of the tracks in a movie are not mapped in the SDP file and cannot be broadcast. The message shows the number of tracks that will not be broadcast.

Permission to access the SDP file was denied. Read/Write access is required. (path: <pathname>, errno: <error number>)
PlaylistBroadcaster was unable to open the file with Read/Write privileges.

Unable to access the SDP file. (path: <pathname>, errno: <error number>)
PlaylistBroadcaster was unable to open the file, but it could not determine a specific reason.

Permission to access the SDP reference movie was denied. Read access required. (path: <pathname>, errno: <error number>)
PlaylistBroadcaster was unable to open the file with Read privileges.

Unable to access the SDP reference movie. (path: <pathname>, errno: <error number>)
PlaylistBroadcaster was unable to open the file.

Warning: The recent_movies_list_size is greater than or equal to the number of movies in the playlist. Each movie will play once, then the broadcast will end.
This message appears after a preflight check. If you want to broadcast to play continuously, you should change the parameter to a number less than the number of movies in the playlist.

Could not open /tmp/broadcastlist. Reason: access denied.
PlaylistBroadcaster uses this file to maintain a list of broadcasts. PlaylistBroadcaster was unable to open the file with Read/Write privileges. You may see this during the preflight check, when starting a new broadcast, or when stopping a broadcast.

Error opening "/tmp/broadcastlist". (<error number>)
PlaylistBroadcaster was unable to open the file.

PlaylistBroadcaster broadcast ID <number> not running.
The broadcast ID number specified in a stop command is not a valid, running broadcast ID.

PlaylistBroadcaster broadcast ID <number>, permission to stop denied.
You tried to stop a broadcast owned by another user; for example, a broadcast started when logged in as Administrator.

Bad argument to stop: ("<stop argument>")
The broadcast ID specified with the stop command was not a number or was less than zero.

About QuickTime Streaming Server 1.0.2

QuickTime Streaming Server

Streaming is a service that sends live and stored multimedia over a network at a rate that lets a client computer play the media in real time. QuickTime Streaming Server streams QuickTime-compatible media to client applications that support QuickTime, including a Web browser with the QuickTime plug-in.

This document is installed with QuickTime Streaming Server in the `/System/Documentation/Administration/Services/QuickTimeStreaming/` directory.
This article has been archived and is no longer updated by Apple.
You can use QuickTime Streaming Server to

- stream low-bandwidth and high-bandwidth multimedia (up to 1.5 megabytes per second).
- reflect live broadcast streams, either unicast or multicast streams.
- manage the number of concurrent connections to the streaming server and the maximum throughput per connection.
- log server usage.
- monitor server activity.

You can install QuickTime Streaming Server when you install Mac OS X Server release 1.1, or you can install it later. To install it later, use the Mac OS X Server installer and be sure to check the option to install QuickTime Streaming Server.

QuickTime Streaming Server software includes

- QuickTime Streaming Server, installed in the /usr/sbin/QuickTimeStreamingServer directory.
- QuickTimeStreamingServerAdmin.app, installed in the /System/Administration/ directory.
- a sample multimedia file, installed in the /Local/Library/QuickTimeStreaming/Movies/ directory.
- a configuration file, installed in the /etc/ directory.

Protocols Used for Streaming

QuickTime Streaming Server uses standard Internet protocols: Real-Time Protocol (RTP), Real-Time Streaming Protocol (RTSP), and Session Description Protocol (SDP). RTP sends data from the server to a client computer. RTSP controls the server from the client computer. It allows a stream to be started and stopped, much the way a VCR can be started and stopped. SDP is used to reflect a multicast.

For information on the files you can stream, see the section "File Formats and Compression Methods Compatible for Streaming."

Server Configuration

Your server must have the following:

- Ethernet connection set up already
- Enough hard disk space to store the multimedia you want to stream
- For best performance, three or more Wide Ultra SCSI hard disk drives are recommended.

Managing QuickTime Streaming Services

You use QuickTimeStreamingAdmin.app to start or stop streaming services, to manage streaming traffic, and to monitor streaming activity. To open QuickTime Streaming Server Administration, choose QuickTime Streaming Admin from the Apple menu.

Starting or Stopping Streaming Services

To start streaming services, open Quick Time Streaming Server Administration and click Start Server in the Settings panel.

To stop streaming services, click Stop Server. If there are active connections to the streaming server, you see a message. You can choose to stop streaming immediately or wait until there aren't any active connections. If you choose to wait until there aren't any active connections, then no new connections will be established.

If streaming service does not start up:

- Check the error log file for error messages.
- Check to be sure QuickTime Streaming Server is in the usr/sbin/QuickTimeStreamingServer directory. The file isn't visible unless you look

for it from Terminal.app. If it is not there, you need to reinstall QuickTime Streaming Server. (Terminal.app in located the /System/Administration directory.)

Making Multimedia Available for Streaming

When QuickTime Streaming Server is installed, a folder named Movies is created automatically in the /Local/Library/QuickTimeStreaming/ directory. Users who connect to your streaming server can stream any multimedia files located this folder.

To use a different folder for streamed media, click the folder button in the Quick Time Streaming Server Settings panel. You can choose only one folder for streaming. All items in the folder you choose are available for streaming, so be sure to check the contents of the folder before you make it available for streaming services.

For best performance, you can put media files on two or more hard disks. But because you can use only one folder for streaming, you need to create a symbolic link from the streamed media folder to the actual location of the media files. For information on creating a symbolic link, see the man pages for the "ln" command.

Setting Up Streaming Capacity

You use Quick Time Streaming Server Administration to limit the number of connections and to set the maximum throughput allotted for streaming services. If you use your server for other services in addition to streaming, you may want to control how much of your server's capacity is dedicated to streaming.

Monitoring Server Activity

You can track peak periods of usage by monitoring server activity. To view server activity, choose Show Activity Monitor from the Server menu. You can change the range of each histogram by clicking the low and high range buttons.

Logging and Viewing Access History

Access history lets you see how many times each media file has been streamed since a particular date and time. To log access history, the Log Access checkbox in the QuickTime Streaming Server Settings panel must be checked. (It is checked by default.) To view Access History, choose Show Access History from the Server menu.

If you click the Clear button in the Access History window, information in the access log is copied to another file, named by date. If you don't clear the log, then access information older than one week is cleared automatically. If you want to delete the cleared access information, drag the dated file to the Trash.

If you want more details about what's being accessed, by whom, and when, you can view the file located at /Local/Library/QuickTimeStreaming/QuickTimeStreamingAccess.log. You may need to write a utility to process the file so you can view a digest of the most important information for your site. For example, you can write a script (using Perl, cshell, or a similar scripting tool) to tally the number of times users from a particular domain connected to the streaming server during a specific time period.

Logging and Viewing Error Messages

A log of error messages can help you troubleshoot problems with streaming services. To log errors, open Quick Time Streaming Server Administration and be sure the Log Errors box in the Settings panel has a checkmark in it. (It is checked by default.) To view the error log file, choose Show Error Log from the Server menu.

If you click the Clear button in the Error Log window, information in the error log is copied to another file, named by date. If you don't clear the log, then error information older than one week is cleared automatically. If you want to delete the cleared access information, drag the dated file to the Trash.

Troubleshooting

You'll be able to troubleshoot streaming problems more easily if error logging is turned on. See the previous section, Logging and Viewing Error Messages.

If performance seems slow

- If you are using the computer for streaming as well as other services, you may need to limit the number of connections or the throughput available for streaming so that other services don't slow down. If you don't want to reduce the number of streaming connections or the throughput, you may need to move other services to another computer.
- If you are using 10-BaseT Ethernet, you may need to upgrade to 100-BaseT Ethernet.
- Put media files on two or more hard disks. But because you can use only one folder for streaming, you need to create symbolic links from

the streamed media folder to the actual location of each media file. For more information see the previous section "Making Multimedia Available for Streaming."
- You may need to expand your server by adding additional hard disks, random-access memory, or Ethernet ports.

If streaming service quits unexpectedly

- Check the error log file for error messages.

If multimedia files are not streamed properly, or errors occur during streaming

- Check the error log file for error messages.
- Check to be sure you have enough random-access memory to support the number of connections or throughput you've set up for streaming.
- Check to be sure you are not running out of hard-disk space.

Preparing Media for Streaming

Any "hinted" QuickTime file can be streamed. You use an application such as MoviePlayer Pro to export media as a hinted QuickTime movie.

A hint track contains information about the media file that's needed to stream the file properly. You must use an RTP hint track with QuickTime Streaming Server; other protocols will not work. Each track in a media file must have its own hint track.

Files do not need to be self-contained. If files are not self-contained, the files that they reference must also be placed directly on the server (AppleShare aliases will not work). In addition, files must have been prepared from the same volume, and placed on the same volume. (The file name in the hinted movie must be relative to the movie, not an absolute path onto another volume). Enclosed files can be in "foreign" formats.

Reflecting a Multicast

To reflect a multicast, copy the Session Description Protocol (SDP) file that describes the multicast to the streaming media folder you set up previously. You must use RTSP to reflect a multicast; other protocols will not work with QuickTime Streaming Server.

When you give your users the URL for the multicast, do not include the sdp extension. For example, if the sdp file is named "greatshow.sdp," the URL you give to your users is

rstp://yourserver.yourdomain.com/greatshow

Note: When you export a hinted streaming movie using MoviePlayer, you have an option to create an SDP file. This SDP file is unrelated to the SDP file needed to reflect a multicast. Do not make this type of SDP file and place it in the server directory. It will not work.

File Formats and Compression Methods Compatible with Streaming

File Formats

- Video: QuickTime, AVI
- Audio: AIFF/AIFC, Sound Designer II, System 7 Sound, uLaw (AU), WAV
- MIDI: Karaoke MIDI, Standard MIDI

Compression-Decompression Methods (CODECs)

Preferred video compressors

- H.263
- Motion JPEG A
- Sorenson Video
- H.261

Preferred audio compressors

- QDesign Music codec
- QUALCOMM Pure Voice
- DVI 4:1
- ALaw 2:1
- uLaw 2:1

- 16-bit raw

Supported video compressors

- Animation
- Cinepak
- Graphics
- Motion JPEG B
- None
- Photo JPEG
- Video

Supported audio compressors

- IMA 4:1
- MACE 3:1
- MACE 6:1

Mac OS 9: PowerPrint USB Compatibility

This article describes the compatibility of Infowave's PowerPrint USB with Mac OS 9.
This article has been archived and is no longer updated by Apple.
Infowave's PowerPrint USB enables USB-equipped computers "to print to over 1600 PC-compatible printers," including the Apple Portable StyleWriter. This is accomplished by using Infowave's printer software and USB-parallel adapter cable, sometimes referred to as a dongle.

PowerPrint 5.0 includes support for Mac OS 9.

PowerPrint 4.5.7 may work with Mac OS 9 with some printers after the PowerPrint USBPrintDriver file is removed from the Extensions folder, the Macintosh is restarted, and the printer is selected again in the Chooser.

Versions 4.5.4 and 4.5.5 of PowerPrint USB are **not** compatible with Mac OS 9.

Note: Infowave distributes other printing solutions including "PowerPrint Serial to Parallel" and "PowerPrint for Networks." Apple is not aware of incompatibilities with these products.

This article provides information about a non-Apple product. Apple, Inc. is not responsible for its content. Please contact the vendor for additional information.

The following Knowledge Base article can help you search for a particular vendor's address and phone number:

Mac OS 9: Arabic Setting Control Panel and Default Arabic Fonts

I installed Mac OS 9, and custom installed Arabic Language Support. I am trying to change the associated Roman Font settings for the Arabic fonts that were installed by Mac OS 9. The Arabic Setting control panel doesn't seem to affect how the fonts are displayed. If I change the associated font to Times, it's still displayed as Geneva or Chicago.
This article has been archived and is no longer updated by Apple.
The Arabic Setting control panel lets you select the Roman Font you want to associate with Arabic fonts. The Font pop-up menu allows you to choose the default Roman font whenever you type Roman characters in an all-Arabic context. This is useful if you are using an application that allows only one text font, or that doesn't let you have multiple fonts in a single line of text.

Arabic Language Support from the Mac OS 9 disc installs two Arabic fonts, AB Cairo and AB Geeza. These fonts have fixed associations with the Roman fonts Chicago and Geneva, respectively. Changes made in the Arabic Setting control panel do not affect these two fonts. However, there are additional Arabic fonts located on the Mac OS 9 disc whose associations to Roman fonts can be set by the Arabic Setting control panel.

These fonts are located on the Mac OS 9 disc, in the CD Extras folder, in the Language Kit CD Extras folder.
Published Date: Feb 19, 2012

Mac OS 9: About Persian Language Support

This article contains the Read Me document for the Persian Language Support feature of Mac OS 9.

The Persian Language Kit Support disk image is included on the Mac OS 9 disc in the CD Extras folder, in the Language Kit CD Extras Folder.

Note: The Persian Language Kit requires a component of Mac OS called WorldScript I. The Read Me below does not mention this. Before following the installation steps provided below, use the Custom Install feature of your Mac OS 9 install CD to install WorldScript I. Select Customized Installation for Mac OS, and click the International checkbox to select it.
This article has been archived and is no longer updated by Apple.

About Persian Language Support

The Persian disk image contains software that allows you to use the Persian language with Mac OS 9.0. This document describes how to install the software and any issues you might encounter.

Using Persian Language Support

The Persian disk image contains the Persian script itself, a Persian keyboard, Persian fonts, and the Persian Setting control panel.

Installing Persian

IMPORTANT The Persian script cannot be installed at the same time as the Arabic script. If you have already installed Arabic support, remove it using the Custom Remove option of your Mac OS 9.0 installer before you attempt to install the Persian script. It is possible to use Persian together with Arabic by only installing the keyboard and fonts, but then sorting will follow Arabic conventions and localized applications will run with Arabic fonts.

If you do not have Arabic installed, you can install Persian by dragging the following items to your closed System folder icon, in this order: the Persian fonts inside the Fonts folder, then the Persian script inside the Persian Script folder, then the Persian Setting control panel inside the Control Panels folder. Do not install the Persian keyboard.

If you do have Arabic installed, you can add limited Persian support by dragging the following items to your closed System folder icon, in any order: the Persian fonts inside the Fonts folder, and the Persian keyboard inside the Keyboards folder. Do not install either the Persian script or the Persian setting control panel.

You must restart your system after installing Persian before you can use it.

Persian Localized Version of SimpleText

This is a version of SimpleText whose menus and dialogs are in the Persian language. To install it, drag it to your hard disk.

IMPORTANT The Persian version of SimpleText can only be used if the Persian script is installed. It will not work correctly using the Arabic script.

Mac OS 9: Do Not Install Older Language Kits

This article describes how to install and use older Apple Language Kits with Mac OS 9.
This article has been archived and is no longer updated by Apple.
Mac OS 9 includes Language Kit functionality that was previously sold separately for Mac OS 8.6 and earlier. Doing an Easy Install of Mac OS 9 onto an existing System Folder does not automatically update any Language Kits that are installed.

If you upgrade an existing Mac OS System Folder to Mac OS 9 where a previous Language Kit had been installed, you must also upgrade your Language Kits for full compatibility with Mac OS 9. Running the Mac OS 9 Installer, and selecting a Customized Installation of the appropriate Language Kit, based on what you had previously installed can do this. You can also select additional Language Kits to install. This will ensure that you have the latest and most compatible components.

If you already have Mac OS 9 installed, you can do a custom install of the Language Kits you want, using the Mac OS 9 installer. Apple recommends that you do not install any of Apple's previous Language Kits. If you are using Mac OS 9 and have installed one or more of the previous Apple Language Kits, please custom re-install the appropriate Language Kits from within the Mac OS 9 installer as mentioned above.

Additional fonts and utilities for certain Language Kits can be found on the Mac OS 9 CD, in the CD Extras Folder, in the Language Kits CD Extras folder.

Mac OS 9: Network Browser Fails To Open

When I try to open the Network Browser application, a dialog appears saying: "'Network Browser' is unable to launch because your system software is not configured properly."

What must I do to correct this?
This article has been archived and is no longer updated by Apple.
Under Mac OS 9, this message indicates that the AppleShare client has been disabled. Network Browser requires the AppleShare extension to be enabled.

Figure 1, Network Browser error message under Mac OS 9

Under Mac OS 8.x, when AppleShare is disabled, the error message from Network Browser is different. It says: "Could not connect to 'at:'. This URL is not correct. Please verify it and retry."

Figure 2, Network Browser error message under Mac OS 8.x

Mac OS 9: Multiple Users - Users and Environments

This article describes the different kinds of users and environments of multiple users, a Mac OS feature introduced in Mac OS 9.0.
This article has been archived and is no longer updated by Apple.
The Multiple Users feature of your operating system offers three different user environments and a full system access environment (accessible only to the owner of the computer). In all the user environments, when a user attempts to open or save a document, the computer automatically points the user to the user's documents folder, and in some restricted cases, the user cannot move away from that location.

Panels
The Panels interface is simple and easy to use. The user has limited access to the computer's hard disk. The user's approved items appear on one panel and the user's documents on another. The environment features large one-click buttons. You can customize the interface to allow large or small icons, and to display the open panels side by side or overlapping, with tabs at the top or the bottom.

Limited user
The Limited user environment allows users access only to some parts of the Finder. Usually, users can save items only in their own folders and can only open approved applications.

Normal user
A normal user can access the Finder and all applications on the startup disk but usually cannot see the contents of another user's documents folder. A normal user with privileges to manage user accounts (account manager) can create, delete or modify user accounts with the exception of the owner's account.

Owner
When you log in as the owner, you gain access into the full system access environment. In this environment, you can:

- install applications
- set up printers
- access other users' documents
- turn Multiple Users access on or off

Mac OS 9: Multiple Users - Setting Privileges For Limited and Panels Users

This article describes how to set privileges for multiple users, a Mac OS feature introduced in Mac OS 9.0.
This article has been archived and is no longer updated by Apple.
You can set certain privileges for Limited and Panels users in the Privileges tab of the user account window in the Multiple Users control panel.

To set privileges for these users:

1. Select a user account.
2. Click Privileges.

The privileges you can change are these:

- CD/DVD-ROMs: Allows users access to all or some CD and DVD-ROM discs. To restrict the user to only certain discs or specific content on selected discs, select the box labeled "List for Restricted Users" and also make your choices in the Other Global settings. If you allow users access to any CD or DVD disc, but you restrict user access to certain content in these discs in the Other Global settings, the users will have access only to specific content in all the discs.
- Removable Media: Allows users access to floppy disks and other storage media (except CD/DVD-ROM discs).
- Shared Folder: Allows users access to the global shared folder on your computer.
- Chooser and Network Browser: Allows users access to the Chooser to create printers and log in to shared disks and allows access to a Network Browser. (Allowing access to the Chooser does not automatically allow printing.)
- Control Panels: Allows users access to the Control Panels folder and all items within it.
- Other Apple Menu Items: Allows users access to items in the Apple Menu other than Chooser, Control Panels, Recent Items, and the About command.
- User Can Print: Allows users to print to the printer specified in the "Allowed Printer" pop-up menu.

Troubleshooting

If Limited users can't do certain tasks included in Mac Help:
Mac Help includes some tasks such as changing the desktop appearance that requires the use of control panels and applications on the hard disk. If users can't complete these tasks, you may not have given the users access to the necessary items.

If CDs to which users don't have access play before being ejected:
Turn off the CD Autoplay feature in the QuickTime Settings control panel.

Mac OS 9: Multiple Users - Restricting Access To Certain Applications

This article describes how to restrict access to applications using multiple users, a Mac OS feature introduced in Mac OS 9.0.

This article has been archived and is no longer updated by Apple.
The owner or account manager can restrict the applications to which a Limited or a Panels user has access.

To set user access to certain applications:

1. Open the Multiple Users control panel.
2. Double-click the name of a Limited or Panels user.
3. Click Show Setup Details and select the Applications tab.
4. In the User Applications list, select the checkbox next to each application the user will use.

Tip: After you have selected the applications, you can use the Show pop-up menu to view just those items to which the user has access.

5. To add a file that is not an application, such as a template for a document or a control panel, to the list of applications, click Add Other.
6. To allow access to most applications and restrict only a few, use the Select All button. If you have selected "All but AppleScripts" in the Show pop-up menu and click the Select All button, the list of applications will not include any AppleScripts. Use the Select None button to set the list of applications back to the default.

Note: To restrict or enable access to "sub-applications" (applications that are part of a larger set of applications), select the sub-application and not just the main application. For example, to give access to Microsoft Word, make sure you select MS Word in the list, not just Microsoft Office.

Troubleshooting

If you aren't notified when new applications are installed:

1. Click Options.
2. lick the Other tab.
3. Make sure that the "Notify when new applications have been installed" checkbox is selected.
4. Log in as the Owner before you install new applications. If any other user has installed a new application, you (the owner) will be notified only when you log out. This will ensure that only you can allow other users access to any new application.

If Limited and Panels users see error messages the first time they use certain applications:

You (the owner) must open all the applications in the system access environment at least one time before the applications are opened by the Limited and Panels users.

Some applications may rely on 'sub-applications' for features such as spell checking. If you experience difficulties using a certain application's feature (for example spell checking), log in under the owner account, open the application, and perform the function. The feature should now function as expected for Limited and Panels users.

If applications fail to work in the Limited or Panels environment:

You (the owner) need to give the users who need to use these applications normal user privileges to access the hard disk.

If aliases of applications deleted from the hard disk remain in the User Applications list:

To remove aliases of deleted applications, click Select None in the Applications tab, choose All Applications from the Show pop-up menu and then click the Select All button.

If Limited users open applications to which you have not given them access:

TA26228_Mac_OS_Multiple_Users_Restricting_Access_To_Certain_Applications.pdf

Limited users can use the Script Editor (an application program for creating AppleScript scripts) to open applications to which they do not have access. To avoid this, you must deny the user access to the Script Editor.

Mac OS 9: Multiple Users - Managing Global User Options

This article describes how to manage global user options for multiple users, a Mac OS feature introduced in Mac OS 9.0.
This article has been archived and is no longer updated by Apple.
You can manage settings that affect all users of your computer using the Multiple Users control panel.

To manage global user settings:

- Click the Options button.

Login settings

- Welcome Message: You can set up a welcome message to appear each time a user logs in.
- Log-in Settings:
  - You can allow or prevent users from using an alternative to a typed password, such as a voiceprint password.
  - You can have users speak their names (if Speakable Items software is installed and enabled in the Speech control panel of your computer) instead of typing or selecting their names. Note: If the voice recognition software is not installed, you can install it by using the Mac OS Installer.
  - You can set login timeout options, specifying whether the user should be logged out or the screen locked.

CD/DVD-ROM Access settings

You can allow users access to only certain CD and DVD-ROM discs and only to specific content in them.

- The "List for restricted users" displays the titles of CD/DVD-ROMs that can be accessed by Limited or Panels users. You can add or remove discs to this list.
- The "Restrict content to" list displays the main contents (root directory level) of the CD/DVD-ROM selected in the "List for restricted users."

Note: If you restrict user access to only certain content in the discs, while allowing user access to any disc (as selected in the Privileges tab of the user window) the users will still have access only to specific content in all the discs.

Other settings

- You can allow or prevent guest access to your system. The privileges you set up for the guest account apply to all who log in as guest.
- You can be notified (through an alert message) when a new application is installed and allow or prevent users from accessing it.
- You can have users choose their names from a list or enter their names when they log in.
- You can specify which kinds of user accounts can log in to your computer:
- Click "Multiple User Accounts (local)" if accounts are located on your computer.
- To allow access only to accounts created in Macintosh Manager, Click "Macintosh Manager Accounts (on network)."

Note: The "Macintosh Manager Accounts (on network)" option is available only if the Macintosh Manager software is available in the language you're using on your computer.

Troubleshooting

If you've turned on the idle timeout option but users aren't logged out (or their screens locked):
Make sure the user has a password. If a user does not have a password, he or she will not be logged out or the screen locked after an idle timeout. To avoid security risks, it is recommended that all users have passwords.
Published Date: Feb 20, 2012

Mac OS 9: File Security - About Digital Certificates and Keys

This article describes kinds of digital certificates and keys supported by file security, a Mac OS feature introduced with Mac OS 9.0
This article has been archived and is no longer updated by Apple.
Digital certificates, or IDs, allow application developers to digitally "sign" files so that users can verify that the file came from the developer. For example, you can check the signatures of applications that you download from the Internet to make sure they come from an authorized source.

Types of certificates

Certificates are issued by Certificate Authorities, independent organizations that verify the identity of the person requesting the certificate.

There are several types of certificates. A **personal certificate** is a certificate that has a corresponding public and private key in the keychain. Personal certificates can be used to sign, verify, encrypt or decrypt information in files.

Only the owner of a personal certificate has its private key. Therefore, files can only be signed by the owner.

A **regular certificate** is used to verify signatures from another person/organization, or to encrypt information for another person/organization.

A **root certificate** belongs to a Certificate Authority.

A root certificate is used to sign certificates issued by the Certificate Authority. Root certificates ensure that the public certificates a person (or organization) uses to verify their signed files are genuine.

The built-in certificates that come with your Keychain software are "trusted" root certificates. That is, Apple has verified the authenticity of their origin.

If you add additional root certificates to your keychain, you must verify the authenticity of their origin. The MD5 and SHA-1 fingerprints can be used to perform the verification.

Viewing the built-in root certificates

As long as you have the root certificate for a Certificate Authority, you can verify any certificates that were issued by that authority.

To see a list of the built-in certificates that come with your Keychain software open the Edit menu and choose Built-in Certificates.

For more information on the built-in certificates, open the Help menu and choose Show Balloons, then point to the item you want to learn more about.
Published Date: Feb 19, 2012

Mac OS 9: File Security - Verifying Digital Signatures

This article explains how to verify a digital signature using file security, a Mac OS feature introduced with Mac OS 9.0
This article has been archived and is no longer updated by Apple.
You can verify whether a Mac OS file or program that you've downloaded from the Internet is from the authorized sender and has not been modified by checking its digital signature using the Apple Verifier program (in the Security folder inside the Applications folder).

To verify the digital signature of a file or program:

- Drag the item to the Apple Verifier icon.
- If the file's signature is verified using the certificates in your keychain, you can choose to open the file or view the certificate by clicking a button in the Verification Results window.
- If the signature is not verified, you can choose to trust that the certificate came from the person (or organization) it says it came from, and the certificate will be added to your keychain. If you choose not to trust it, the file remains on your hard disk.

IMPORTANT: Before you trust a certificate, you should personally verify its digital "fingerprint" (the certificate's unique ID number that appears in the certificate window) by contacting the company directly. If you trust a certificate without verifying its ID, the security of files on your computer may be compromised.

Tip: For more information about items in the Verification Results or Trust windows, open the Help menu and choose Show Balloons, then point to the item you want to learn about.

Creating and adding items to a keychain
You can create an empty keychain and then add items to it when you connect to servers or use applications that require passwords. Or, if a keychain doesn't already exist, you can tell an application to add an item to your keychain and it will automatically create a keychain for you.
Published Date: Feb 19, 2012

Mac OS 9: File Security - Creating a Keychain

This article explains how to create a keychain using file security, a Mac OS feature introduced with Mac OS 9.0
This article has been archived and is no longer updated by Apple.
Note: If you used the Multiple User control panel to set up your computer for multiple users, each user already has a keychain.

To create a keychain:

1. Open the Keychain Access control panel.
2. If a keychain doesn't already exist, you're asked if you want to create one. Click Create. If a locked keychain already exists, click Cancel, then open the File menu and choose New Keychain.
3. Enter information for your new keychain and click Create.

Remember your password, because you'll need to re-enter it exactly to use the keychain. To make your keychain more secure, be sure to choose a good password.

Your keychain is stored in the Keychains folder in the Preferences folder inside the System Folder.

IMPORTANT: When your keychain is unlocked, any person using your computer can open applications using the passwords on your keychain. (They cannot, however, see the passwords on your keychain unless they know your keychain password). For security, you should always lock your keychain when you're not at your computer.

The first keychain you create is your "default" keychain. All new keychain items are added to the default keychain.

To change the default keychain, unlock the keychain, and choose "Make <your keychain> default," where "your keychain" is the name of the active keychain, from the Keychains menu. (The Keychains menu only appears when you have more than one keychain).

Adding items to a keychain

You can add items to your default keychain from within an application or login dialog box that requires password access, or from the desktop.

To add application passwords to your default keychain, open the application and enter your password. Look for a checkbox (or other device) that allows you to add your password information to a keychain.

If you don't see a way to add your password information to a keychain, check the documentation that came with the program. The program might not support keychains.

To add items to your keychain from the desktop, drag the AppleShare IP server, Internet location, or certificate icon to your Keychain window. You can also drag URLs directly from a web browser or Network Browser.

Tip: You can also add new certificates to your keychain while you're using the Apple Verifier program to check a file's signature.

If an AppleShare IP server's "Add to Keychain" checkbox is dimmed, the server may not be set up to allow users to save passwords on a keychain. For more information, contact your server administrator.

Mac OS 9: File Security - Choosing a Good Password

This article explains how to choose a good password for use with file security, a Mac OS feature introduced with Mac OS 9.0
This article has been archived and is no longer updated by Apple.
Choosing a good password for your keychain is an important step in keeping the keychain secure. Your keychain password protects all information stored on the keychain.

IMPORTANT: If your keychain password is discovered, all of your passwords can be discovered. However, personal certificates are still secured by their passwords.

Keep the following tips in mind when choosing your password:

- Make your password unique. For example, do not use the same phrases or words you use for your server passwords.
- Include some numbers in your password, but do not use your banking PIN, address, phone number, or other numbers that can be easily guessed.
- Don't base your password on personal information, such as your spouse's name, your pet's name, or the city where you live.
- Don't use single words or phrases that are found in the dictionary.
- Don't tell anyone your password, and never write it down.
- Use upper- and lowercase letters and punctuation, but make sure you remember what you choose. You must enter your password and user name exactly as you originally entered them.

Example of a good password:
Choose a phrase that's easy for you to remember, and follow the guidelines above to make it into a unique password. For example, the phrase "To be or not to be, that is the question" could be made into the following password: 2BrntB-Titq
Published Date: Feb 19, 2012

Mac OS 9: File Security - Changing Keychain Settings

This article explains how to change keychain settings using file security, a Mac OS feature introduced with Mac OS 9.0.
This article has been archived and is no longer updated by Apple.
You can edit your keychain password and other settings in the Settings window (in the Edit menu) of the Keychain Access control panel.

Important: If multiple user access is turned on, you should only change your keychain password in the login window that appears when you turn on your computer. If you change your password in the Keychain control panel, you will not be able to log in to your personal environment the next time you start up your computer.

To change your keychain settings:

- Unlock the keychain you want to edit, then open the Edit menu and choose "your keychain Settings," where "your keychain" is the name of the currently active keychain. Make your changes in the settings window, then click Save.
- To change your password, enter a new password, then type it again to confirm it.
- To see a dialog box when an application tries to access your keychain, make sure the "Allow access without warning" checkbox is unchecked.
- To automatically lock your keychain after your computer has been idle for a specified number of minutes, make sure the "Lock after 10 minutes of inactivity" checkbox is checked, and enter a number of minutes.
- To automatically lock your keychain when your computer goes to sleep, make sure the "Lock when the system sleeps" checkbox is checked.

Deleting a keychain

To delete a keychain, make sure the keychain is locked, then drag the keychain file from the Keychains folder in the Preferences folder (inside the System Folder) to the Trash.

Important: If you delete a keychain that holds certificates, you may not be able to verify files which have been signed by those certificates.

Mac OS 9: File Security - Using Your Keychain On Another Computer

This article explains how to copy your keychain to another computer in order to use file security, a Mac OS feature introduced with Mac OS 9.0
This article has been archived and is no longer updated by Apple.
You can use your keychain on more than one computer, such as your computers at home and at work.

To use a keychain on another computer:

1. Make sure the Keychain Access control panel is installed on the computer you want to use.
2. Lock your keychain.
3. Make a copy of your keychain file. Keychains are stored in the Keychains folder, in the Preferences folder, inside the System Folder.
4. Copy the keychain file to the Keychains folder on the other computer.
5. Unlock your keychain.

Published Date: Feb 19, 2012

Mac OS 9: File Security - How to Protect Files and Disks, and Turn on Password Security

This document explains how to protect files and disks using file security, a Mac OS feature introduced with Mac OS 9.0
This article has been archived and is no longer updated by Apple.
You can prevent users from accidentally changing or deleting important information on your hard disk by locking files and disks, and adding password protection.

Locking and unlocking files
If a file is locked, you can open it and copy its contents, but you can't change or delete the file. To lock a file, click the name of the file, then open the File menu and choose Get Info.

Protecting files on a disk
You can protect a disk so that the information on it can be viewed but not erased or changed. To protect a hard disk, cartridge, or optical disk, use the Drive Setup application program, inside the Utilities folder on your hard disk.

Note: Many disks and cartridges also have locking mechanisms on their cases or containers. See the instructions that came with the disk for more help.

Password-protecting your portable computer's hard disk
You can protect the contents of your portable computer's hard disk by creating a password. When password security is turned on, you must enter your password when the computer first starts up or when it wakes from sleep (optional).

To create a password and turn on password security, use the Password Security control panel.

You can change your password or turn off password security at any time.

You should not use the Password Security control panel with PowerBook (FireWire) computers. See technical document 60729: "**PowerBook (FireWire): Password Security**".
Published Date: Feb 19, 2012

Mac OS 9: File Security - Encrypting and Decrypting Files

This article explains how to encrypt and decrypt files using file security, a Mac OS feature introduced with Mac OS 9.0
This article has been archived and is no longer updated by Apple.
You can encrypt your files so that others cannot open them without your password. To do so, use the Apple File Security program (in the Security folder inside the Applications folder). The program also automatically compresses files so they take up less disk space.

Apple File Security uses a 56-bit key to encrypt files.

Note: You cannot encrypt folders, disks, volumes, items in the System Folder, or files that are open or locked.

Encrypting files

To encrypt a file:

1. Open the File menu and choose Open, then locate the file you want to encrypt. Tip: You can also choose Encrypt from the Finder's File menu. If you open an alias, the file that the alias refers to will be encrypted.
2. Enter a password for the file. Be sure to remember your password so you can enter it to decrypt the file. By default, the password is added to your keychain. To prevent it from being added, deselect the "Add to keychain" checkbox.
3. Click Encrypt. Tip: As long as the file is not a stationery pad document, you can also encrypt (or decrypt) the file by dragging it to the Apple File Security icon.

Decrypting files

To decrypt a file:

1. Double-click the file you want to decrypt.
2. Enter the password that was used to encrypt the file. If you added this password to your keychain and your keychain is unlocked, you won't be asked to enter your password here.
3. Click Decrypt. After you decrypt the file, the password you used to encrypt it is removed from your keychain.

Published Date: Feb 19, 2012

Mac OS 9: Matching Fonts With FontSync

This article explains how to match fonts using FontSync, a Mac OS feature introduced with Mac OS 9.0.
This article has been archived and is no longer updated by Apple.
You can create profiles of the fonts on your system, called "FontSync profiles," to make sure the fonts used in your documents match the fonts used on the computer where the document is printed. You can also change the default font-matching criteria.

Creating a FontSync profile

To create a FontSync profile, open the Create FontSync Profile script, in the Font Extras folder in the Apple Extras folder, then name the profile.

After the profile is created, you can take it to another computer and use the Match FontSync Profile script to compare it to the fonts on that computer.

Comparing FontSync profiles

To compare a FontSync profile to a set of fonts, open the Match FontSync Profile script, in the Font Extras folder in the Apple Extras folder, then select the FontSync profile that you want to compare to the fonts on this computer.

The matching script will create a list of the fonts that do not match those in the profile.

Tip: If you're familiar with AppleScript, you can modify this script to do other actions. For example, you can make the script compare two profiles. See the comments in the script file.

Changing the default font-matching criteria

The default font-matching criteria define what parts of a font are used when comparing a FontSync profile against the fonts on a computer. You can change the default font-matching criteria using the FontSync control panel, in the Font Extras folder in the Apple Extras folder.

Note: For most users, the default FontSync control panel settings do not need to be changed.

To change the default font-matching criteria, click the checkbox next to the font criteria that you want to be used when creating font profiles, then then close the control panel.

Tip: For more information about the matching criteria, open the Help menu and choose Show Balloons, then point to the item you want to learn more about.

Tip: If you plan to use this control panel frequently, you may want to put it in your Control Panels folder, inside the System Folder.

Desktop Printing: Error -8940

This document explains what Error -8940 is and how to correct this issue.
This article has been archived and is no longer updated by Apple.

Symptom

When trying to print to a LaserWriter it displays this error:

"Document (name of print job) failed to print on the printer (printer name) because of an error -8940. Cancel Job, Hold Job and Try Again"

A similar message may appear when I attempt to Auto Setup the DTP with the Desktop Printer Utility or when using the Finder's Printing menu.

Solution

Error -8940 is an errInvalidDTPType, returned from psGetDTPType. This error code indicates that the PAPA Resource described an invalid or unrecognized desktop printer type. Basically your desktop printer has incorrect information about your printer and as a result is unable to communicate with and print to it properly.

Typically this occurs when creating a desktop printer whereas the error message is typically displayed when attempting to communicate and open up a PAP connection with the printer. Clues that a desktop printer may not work include:

1. It has a generic icon.

2. The Info window for the desktop printer may have no information listed in the Zone field. (Choose Get Info from the File menu to open the Desktop Printer's Info window.)

   - Note that an asterisk is an acceptable Zone name. A blank Zone field indicates a problem with the desktop printer, when using LaserWriter software 8.5.1 or later.
   - Desktop printers created with older drivers or for IP or other connections may not list a Zone or include a Zone field at all.

Often this issue is easily worked around by throwing away the existing desktop printer icon, emptying the Trash, then creating a new one with the Chooser, Desktop Printer Utility, or the Mac OS Setup Assistant. In some cases, it may be necessary to also throw away the printer preference file. However, there are some configurations where these solutions will not work as expected, described in more detail below.

Using the Desktop Printer Utility v1.0, 1.1, or 1.2, On a Network That Has No Zone

You will likely encounter an -8940 error message when creating or when printing to an AppleTalk desktop printer created with the Desktop Printer Utility on a network that has no defined zone or zones. The error message will also occur when you create an AppleTalk desktop printer using the DTP Utility, when the printer is directly connected to your Macintosh with a serial cable.

The workaround is to use the Chooser or Mac OS Set Up Assistant to create and configure your AppleTalk desktop printer. You may continue to use the Desktop Printer Utility to configure an IP, USB or other type of PostScript laser printer desktop printer.

Using the Chooser on a Macintosh Connected to LocalTalk, When a Bridge is Present

You will likely encounter an -8940 error message when creating or when printing to a desktop printer created with the Chooser, if the client and printer are both on the same LocalTalk segment, and there is a LocalTalk Bridge or possibly a hardware bridge on that segment. Note that this should not pose difficulties if the Macintosh is on Ethernet and the printer is on LocalTalk, or vice versa.

The workaround is to use the Mac OS Setup Assistant to select the printer. Alternatively, disable the bridge, choose and create the Desktop Printer, then re-enable the bridge. A third option is to install LaserWriter 8 and PrintingLib versions 8.4.3 and print from them. Note that LaserWriter 8, version 8.4.3 has received very little testing after Mac OS 8.0, so its compatibility with current Mac OS system software is unknown.

Described above are two very specific situations where the desktop printer created for your printer may not be able to communicate with the printer and returns an -8940 error. This occurs at the time the desktop printer is created, but may be discovered later when the desktop printer attempts to open up an AppleTalk connection and communicate with the printer.

If you encounter an -8940 error, check whether your environment is described as above. If so, you may wish to pursue one of the suggested workarounds.

If your printing environment is not as described above, the first workaround is to throw away the desktop printer icon for the printer you are unable to print to, empty the Trash, then attempt to create a new DTP.

In some cases you may need to throw away the old DTP and the Parsed PPD Folder (System Folder: Preferences: Printing Prefs: Parsed PPD

Folder), empty the Trash, then rebuild the Desktop Printers DB. To rebuild the Desktop Printers DB:

1. Restart your Macintosh.
2. Press and hold down the Command and Option keys until this message is displayed: Are you sure you want to rebuild the desktop file on the disk "your hard disk"?
3. Click OK to rebuild the desktop files.

After performing these steps, attempt to create the DTP with the Chooser or Mac OS Setup Assistant.

If difficulties were first encountered after installing other vendors' PostScript printer software, consider removing or throwing away that printer software, then reinstall the latest version of LaserWriter 8 from CD or from Apple Software Updates. The LaserWriter 8 driver uses PostScript Printer Description (PPD) files to determine the characteristics of the printers it uses. PPDs may be obtained from your printers' manufacturer. Copy the PPD to the Printer Descriptions folder (System Folder: Extensions folder: Printer Description).

If -8940 errors persist, be very observant when creating a new desktop printer. For example, if you use the Chooser to create a desktop printer, and the printer is not visible in the Chooser at all or if the Auto Selection process does not work as anticipated, some other issue may exist that could result in the desktop printer not being created. Such a situation preventing the proper creation of the desktop printer may require additional troubleshooting to identify and work around.

Mac OS 9: Installing the Mac OS

This article provides instructions for installing Mac OS 9.
This article has been archived and is no longer updated by Apple.

Step 1: Start Up From the Mac OS 9 CD

Before you begin, turn off any security or virus-protection software you have installed on your computer.

If you have a PowerBook, plug it in and set Sleep Setup to Never in the Energy Saver control panel.

Next, start up your computer using the Mac OS 9 CD.

1. Insert the CD in your computer's CD-ROM drive.
2. Shut down your computer.
3. Turn on your computer while holding the C key on your keyboard. Continue holding the C key until you see the "Happy Mac" icon. You'll know you've started up from the CD when your computer's desktop pattern changes to a light-colored background that says "CD."

Step 2: Open the Installer

To begin installation, double-click the Mac OS Install icon.

Note: If you see a message that your computer's firmware needs to be updated, restart the computer from the hard drive, and then follow the instructions for updating your firmware in the CD Extras folder on the Mac OS 9 CD before proceeding. After a moment, a screen appears describing the installation process.

After Installing the Mac OS

After you install the Mac OS, you can easily set up your computer and prepare it to connect to the Internet by using the Mac OS Setup Assistant and the Internet Setup Assistant.

Mac OS Setup Assistant

The Mac OS Setup Assistant appears automatically after you install the Mac OS, making it easy to set up your computer. The assistant asks questions about you, your location, and how you want your computer configured. Then it makes all the settings for you.

Internet Setup Assistant

After the Mac OS Setup Assistant is finished, the Internet Setup Assistant will help you set up your computer for Internet access. You can use it to sign up for an Internet account, if you don't already have one. If you were already set up for Internet access before installing the Mac OS, your previous settings are retained and you don't need to use this assistant.

Register With Apple

In most countries, you can register your computer and other Apple products on the World Wide Web. Double-click the Register With Apple icon on your computer's desktop. Be sure to place your sales receipt in a safe place. You will need it for warranty validation.

Mac OS 9: Troubleshooting Installation from CD-ROM

This article has been archived and is no longer updated by Apple.

This document provides troubleshooting tips for common installation questions. The topics discussed in this document are:

I. If the computer does not have a CD-ROM drive
II. If you cannot start up the computer from CD
III. "Installer cannot repair your hard disk" message
IV. "Update firmware" message
V. Installer cannot update non-Apple hard disks
VI. "Not Enough Memory" to install message
VII. "Not Enough Disk Space" to install message
VIII. "System File Cannot Be Modified" message
IX. "Item Cannot Be Replaced" message
X. "Installation Was Not Successful" message
XI. "Must boot with the Mac OS CD" message
XII. "Big System Morsels" message

I. If the computer does not have a CD-ROM drive

You can install the Mac OS using a CD-ROM drive attached to another Macintosh. Connect both computers to a network, then use file sharing to access the CD from across the network. See the onscreen Help for information about using file sharing with your computer.

To ensure a trouble-free installation, turn off any disk security or virus-protection software you have installed. Then use the Extensions Manager control panel to turn off non-Apple extensions and control panels. Make sure you have AppleShare extension 3.6.4 or later (a copy is available on the Mac OS CD; install it if necessary). See the onscreen Help for information about using the Extensions Manager control panel.

After you've turned off the extensions, restart your computer, then open the Installer and install the Mac OS. Following this process will help ensure that incompatible extensions don't interfere with the installation process.

After the installation is finished, you can turn on your extensions and virus-protection software.

Please note that this process will not work if your Mac cannot boot from a local hard drive. This process also won't update the volume you are booted from.

II. If you cannot start up the computer from CD

With the CD inserted, open the Startup Disk control panel and click the CD icon in the Startup Disk window. Then restart the computer and install the Mac OS. After installation, use the Startup Disk control panel to reselect your hard disk, then restart your computer.

III. "Installer cannot repair your hard disk" message

See technical document 60203, "**Mac OS 8/9: The Installer Cannot Repair Your Hard Disk**."

IV. "Update firmware" message

See technical document 60643, "**Mac OS 9: Update Firmware Before Installing**."

V. Installer cannot update non-Apple hard disks

Use the disk utility recommended by the manufacturer of your hard disk to update your drivers before installing the Mac OS. Make sure to get a version of the utility that is compatible with the software you are installing. An old utility will not be able to update your disk with the most current driver.

VI. "Not Enough Memory" to install message

Make sure you've started up your computer from the Mac OS CD. If you can't start up from the CD, quit all open applications and make sure you've followed the steps described in "You Can't Start Up the Computer Using the Mac OS CD" above.

VII. "Not Enough Disk Space" to install message

Make more space available on your hard disk by removing some files from the disk. Copy the files you want to keep to another disk, then drag them to the Trash and choose Empty Trash from the Special menu to delete the files. You don't need to quit the Installer before you remove files from the disk.

VIII. "System File Cannot Be Modified" message

Make sure that you've started up your computer using the Mac OS CD. If you can't start up from the CD, make sure any security and virus-protection software is turned off.

IX. "Item Cannot Be Replaced" message

The Installer is attempting to replace a file, but there is a folder on the disk that has the same name as the file being replaced. (Files cannot replace folders.) Find the folder on your disk and rename it, then try the installation again.

X. "Installation Was Not Successful" message

Make sure that you've started up your computer using the Mac OS CD. If you can't start up from the CD, make sure any security and virus-protection software is turned off. Press and hold the Shift key while starting up from the Install disc to disable extensions; try the installation again.

XI. "Must boot with the Mac OS CD" message

If you are installing Mac OS 9 after Mac OS X, this message appears: "To install this software you must boot with the Mac OS CD". See technical document 106244, "**Mac OS 9.1, Mac OS X 10.0: "To install this software you must boot with the Mac OS CD" Message**."

XII. "Big System Morsels" message

See technical document 25222, "**Mac OS 9: "Big System Morsels" Error During Installation**."

Published Date: Feb 20, 2012

Mac OS 9: Resolving Software Conflicts After Installation

If your computer does not start up properly or behaves erratically, you probably have an incompatible extension, control panel, or application. This article has been archived and is no longer updated by Apple.

Step 1: Verify the Problem

To verify that you have a compatibility problem, follow these steps:

1. Start up your computer while holding down the Space bar. When the Extensions Manager control panel appears, release the Space bar.
2. Open the Selected Set menu and choose the item with the words "Mac OS Base." This turns off all extensions and control panels except those installed with the Mac OS.
3. Close the Extensions Manager to continue startup.
4. When the computer is finished starting up, try the same actions that caused the problem.

If the problem no longer occurs, you probably have an extension or control panel that doesn't work with this version of the Mac OS. Continue with the steps in "Test Individual Extensions and Control Panels," next, to identify the item that is causing the problem.

If the problem still occurs, try checking your hard disk for problems using the Disk First Aid utility, provided on the Mac OS CD. If the problem occurs only when using a certain program, that program is probably not compatible or may need to be reinstalled. Check with the program's manufacturer for information.

Step 2: Test Individual Extensions and Control Panels

To test an individual extension or control panel for compatibility, follow these steps:

1. Restart your computer while holding down the Space bar. The Extensions Manager appears again.
2. Turn on the item you want to test by clicking its checkbox.
3. Close the Extensions Manager to continue startup.
4. Try the same actions that caused the problem. If the problem does not occur again, then the item you turned on is probably compatible with this version of the Mac OS. If the problem occurs again, the item you turned on is probably incompatible. Open the Extensions Manager control panel and click the item's checkbox to deselect it.
5. Repeat steps 1 through 4 for each item you want to test.

If you find that a piece of software is incompatible, turn it off or remove it from your computer, then contact the manufacturer of the software to see if an updated version is available.

Mac OS 9: Troubleshooting Setting Up Internet Access

This article provides troubleshooting tips for setting up Internet Access.
This article has been archived and is no longer updated by Apple.

Your modem doesn't appear in the list of modem types in the Modem Settings window of the Internet Setup Assistant.
Copy the modem script file (CCL) supplied with your modem into the Modem Scripts folder in the Extensions folder. Additional modem scripts are available in the CD Extras folder on the Mac OS CD. If you can't find a script for your modem, contact the manufacturer of the modem to get this file. Once the file is copied into the Modem Scripts folder, your modem will appear as a choice the next time you open the Internet Setup Assistant.

You have an internal modem, but the Port menu in the Modem Settings window of the Internet Setup Assistant does not include Internal Modem as a choice.

- On computers with an internal comm slot, the internal modem shows in the software as if it were attached to the modem port. If your computer has an internal modem, but it does not appear as a choice, then Modem Port is the correct selection.
- Some modems require special extensions to allow the computer to recognize them. Use the Extensions Manager control panel to turn on any modem extensions. You may need to reinstall the software that came with your modem if you cannot identify the required extension.

Your modem appears in the list of modem types in the Modem Settings window, but your modem does not seem to be working.

- Check to see that your modem is turned on and connected to your computer and to your phone line correctly.
- You may need to contact the modem vendor to get an updated modem script. Once you get this script, copy it into the Modem Scripts folder in the Extensions folder (inside the System Folder).

While you are attempting to create a new account, the line seems to have dropped or you get no response.
When you create an account, the Setup Assistant places a call to an Internet registration server. Sometimes the server is busy temporarily and you can try to create the account again almost immediately.

You used the Internet Setup Assistant to select your previous configuration, but now you can't connect to the Internet.
Make sure the settings in the TCP/IP control panel are correct. Or, use the Internet Setup Assistant to create a new configuration with the correct settings. Contact your Internet service provider or network administrator to find out what your settings should be.

Mac OS 9: Missing or Moved Items After Installation

After I installed Mac OS 9, I can't see the AppleCD Audio Player in the Apple Menu, in fact there are a lot of things missing from there. Where did these things go?
This article has been archived and is no longer updated by Apple.
Many of the items that were previously located in the Apple Menu are not actually removed with a Mac OS 9 installation, they are simply installed elsewhere on the hard drive.

Now located in the Applications folder:

- Apple DVD Player
- Apple Video Player
- Apple CD Audio Player
- Graphing Calculator
- SimpleSound

Now located in the Apple Extras folder:

- Note Pad

Internet items are located in the Internet folder on the root level of the hard drive. The "Connect to..." application is no longer installed. For more information see Knowledge Base article:

Article 60599 "**Mac OS 9: What Happened To The "Connect To..." Application?**"

If you still wish to have these applications present in the Apple Menu, simply create an alias of the Application from its new location and move the alias to the Apple Menu Items folder in the System Folder.

Note: Jigsaw Puzzle is only present if upgrading from Mac OS 8.5 or earlier. It was removed by the Mac OS 8.6 installer and is no longer installed by Mac OS 9.
Published Date: Feb 19, 2012

Mac OS 9: Open Control Panels Listed in Application Menu

With Mac OS 9, open control panels appear in the Application menu.
This article has been archived and is no longer updated by Apple.
In Mac OS 9, control panels are treated as if they were individual application programs. Like applications, all open control panels are listed in the Application menu.

In previous versions of Mac OS, some control panels shared memory with the Finder or System. If a control panel failed, it could cause the Finder or System to stop responding, or "freeze." Under Mac OS 9, when a control panel fails, it quits and the message "Application Unexpectedly Quit" appears.

Some control panels must run in the Finder's memory partition to work with Mac OS 9. As a workaround, you can open such a control panel in the Finder's memory partition by holding down the Command and Control keys while opening the control panel. This technique works only for control panel files containing a 'cdev' resource. Because this is only a workaround, you should check with the control panel's publisher or programmer for an update.
Published Date: Feb 19, 2012

Mac OS 9: What‘s New - Package Files

Mac OS 9 supports a new way to distribute applications, documents or libraries. A series of related files (templates, preferences or other application-specific files) can be "combined" into a folder that looks and behaves like a file.
This article has been archived and is no longer updated by Apple.
You can identify a package file by looking at the general information pane of the Get Info window in the Finder. A package will have the word "package" in the kind field. Some examples are: document package, library package, application program package, or simply 'package'.

In most cases, the package will be treated just like it's single file equivalent. However, any software that has not been revised to work correctly with packages may show a package as a folder and you will be able to see the files inside of it.
Published Date: Feb 19, 2012

Mac OS 9: Folders That Behave Like Package Files

I have a folder on my disk that has suddenly turned into a "package" file. I can't get it to open. Is there a way to fix this?
This article has been archived and is no longer updated by Apple.
The Package First Aid utility on the Mac OS 9 CD is used to fix a folder that has started behaving like a package in the Mac OS 9 Finder.

To turn the "package" back into a folder:

1. Copy the Package First Aid utility to your computer from the Mac OS 9 CD.
2. Drag the folder that is behaving like a package on top of the Package First Aid utility's icon.

Published Date: Feb 19, 2012

Mac OS 9: How To Use The Software Update Control Panel

Software Update is a new feature of Mac OS 9 that checks for updates to the operating system. It does not check for updates for non-Apple software. Using this feature of Mac OS 9 you can quickly check for, download, and install updates to the system software without having to open a web browser.
This article has been archived and is no longer updated by Apple.
To use Software Update:

1. Connect to the Internet.
2. Open the Software Update control panel.
3. Click Update Now.

The computer will check to see if there are any updates available. If there are updates you will be prompted to install them.

You can also set Software Update to check for updates automatically. If you are not connected to the Internet when the software update is scheduled, it will check the next time you connect.

If a particular update requires that the computer be restarted, you will be prompted to do that, too.

The Software Update control panel does not check for software that is not installed on your computer. It cannot check for updates for another computer, either.

Mac OS 9: "Allow File Sharing Clients To Connect Over TCP/IP" Is Disabled

The "Allow File Sharing clients to connect over TCP/IP" feature in the File Sharing control panel is disabled. What should I do?
This article has been archived and is no longer updated by Apple.
Possible solution:

The ShareWay IP Personal Bgnd extension is missing, disabled, or damaged. Use the Extensions Manager to enable this system extension.
Published Date: Feb 19, 2012

Mac OS 9: Is TCP/IP File Sharing Faster Than AppleTalk File Sharing?

Is Personal File Sharing over TCP/IP included with Mac OS 9 faster than Personal File Sharing over AppleTalk?
This article has been archived and is no longer updated by Apple.
The implementation of Personal File Sharing over IP included with Mac OS 9 will not always be faster than Personal File Sharing over AppleTalk depending on file size, computer configurations, network configuration, and traffic load. You may wish to use File Sharing over TCP/IP if that is your organization's preferred networking protocol.

Note: The AppleTalk control panel must be on in order to start Personal File Sharing over IP. However, you can set your AppleTalk control panel to any setting in order to remove AppleTalk from your network connection.
Published Date: Feb 19, 2012

Mac OS 9: File Sharing Versus AppleShare IP

Now that Personal File Sharing supports IP, do I need AppleShare IP?
This article has been archived and is no longer updated by Apple.
AppleShare IP provides more services, and can support more concurrent users than Mac OS 9's File Sharing. If you have a small workgroup, and the only feature of AppleShare IP you use is the ability to connect over TCP/IP, File Sharing over IP may be all you need. If you need a Web server, Mail server or DNS server (through bundled MacDNS), then you would benefit from using AppleShare IP.

File Sharing in Mac OS 9 has the same limitations that File Sharing does. Only ten users can be connected at one time.

Mac OS 9: Installing Apple Remote Access 3.5

This article provides tips on installing Apple Remote Access 3.5, part of Mac OS 9.0.
This article has been archived and is no longer updated by Apple.
Apple Remote Access (ARA) 3.5 now includes both server and client software. This allows a Macintosh computer to act as a server for remote clients dialing in via a modem and phone line. These clients can connect using either the AppleTalk Remote Access Protocol (ARAP) or Point-to-Point Protocol (PPP). Once the connection is successfully made, the computer acts just like being on a local AppleTalk (ARAP) or TCP/IP (PPP) network.

Apple Remote Access is a separate package from Mac OS 9, but is installed by default. As with other components of the Mac OS 9 Installer, ARA can be custom installed if necessary. Apple Remote Access can also be custom removed using the Mac OS 9 Installer. In addition, the components installed in the system can be disabled in the Extensions Manager by viewing as packages and disabling the ARA Server 3.5 package.

Note: If you have Remote Access (client or server) installed but disabled, the Mac OS 9 installer will not update the software. The pieces used by previous, separate versions of ARA client and ARA server have the same name, so you must look at the package name and version. The Extensions Manager package Mac OS 9 installs is called "ARA Server 3.5". This is a bit of a misnomer, it is really the client AND server versions. You will need to either manually discard the pieces of the old package of software, or use the extensions manager to enable (or disable) both packages. When you close the Extensions Manager control panel, you will be prompted once for each piece (5 in all) to replace them. MAKE SURE to keep the newer version and delete the older version.
Published Date: Feb 19, 2012

Mac OS 9: Limitations of Apple Remote Access Personal Server 3.5

This article outlines the limitations of Apple Remote Access (ARA) Personal Server 3.5.
This article has been archived and is no longer updated by Apple.
Remote Access Personal Server cannot perform the following tasks:

- Bridge two networks. ARA cannot bridge two networks connected via modems. It may be necessary for the client to configure AppleTalk for Remote Only if problems arise in such a scenario.
- Handle multiple connections. ARA Server can only handle one remote dial-in connection at a time.
- Connect over the Internet. ARA must connect over a phone line using analog modems. It is not possible to use ARA over LANs or LAN connections such as T1s, cable modems, ADSL, etc. ISDN connections are supported.

Published Date: Feb 19, 2012

Mac OS 9: What Is A Neighborhood?

This article describes network services called Neighborhoods.
This article has been archived and is no longer updated by Apple.
A neighborhood is a group of network services that have a logical grouping. They can share a TCP/IP domain or subdomain, (apple.com, or euro.apple.com)You can add your own neighborhoods. The ones you add will show up in the Favorites folder as a neighborhood location-type Internet location file. An apple.com neighborhood is installed by default.

Mac OS 9 computers can only see Personal Web Sharing and File Sharing of other Mac OS 9 computers (SLP version 1.1). Mac OS 8.5 or Mac OS 8.6 computers can only see other services with the same OS.

If your network does not have multi-cast-enabled routers, then you might only see services on your TCP/IP subnet.
Published Date: Feb 19, 2012

Mac OS 9: What is NSL?

What is NSL?
This article has been archived and is no longer updated by Apple.
The Network Services Location (NSL) Manager provides a protocol-independent way for applications to discover network services that are available in the local network. An application can use the NSL Manager to obtain a list of network services, display the list, and allow the user to choose and connect to a particular network service. Both Navigation Services dialog boxes and Network Browser use NSL.

NSL features in Mac OS 9 are:

- NBP Plug-in - For the Name Binding Protocol (part of AppleTalk).
- LDAP Plug-in - For the Lightweight Directory Access Protocol (LDAP).
- Supports version 2.0 of the Service Location Protocol (SLP).
- You can drag and drop from NSL dialogs and make internet location files.

SLP - Service Location Protocol
An emerging standard, open protocol. Used for advertising and discovering network services. File Sharing and Personal Web Sharing use this.

DNS - Domain Name Server
This looks up machine names (like www.apple.com) and translates them into IP addresses

LDAP - Lightweight Directory Access Protocol
Commonly used for phone directories, etc. The "People" servers that Sherlock 2 uses are LDAP servers. LDAP is a standard protocol defined in RFC 1488 (1777, 2251). This protocol communicates over TCP/IP.

NBP - Name Binding Protocol (NBP)
Part of AppleTalk that translates AppleTalk zone and machine names into their corresponding numbers. This protocol communicates over AppleTalk.
Published Date: Feb 20, 2012

Mac OS 9: Troubleshooting NSL Used By Network Browser

This article answers common questions in troubleshooting Network Services Location (NSL) used by the Network Browser.
This article has been archived and is no longer updated by Apple.

Why can't I see computers listed on my DNS server?
The DNS server has to be properly configured by the administrator to have an entry for each service and to accept zone transfers.

I can't see some devices.
The routers on your network must support IP multicasting. The Network Administrator should refer to the router vendor to find out, if she doesn't already know.

I can't see some devices on my older Macs.
Older Macs can see each other. Mac OS 9 Macs can see each other. Mac OS 8.5 and 8.6 clients can see each other because they use version 1.0 of the SLP protocol. Mac OS 9 clients can see other Mac OS 9 clients. Mac OS 9 uses version 1.1 of the SLP protocol.
Published Date: Feb 20, 2012

Mac OS 9: What‘s New - Open Transport 2.5

This article describes the new features of Open Transport 2.5 in Mac OS 9.0.
This article has been archived and is no longer updated by Apple.
The new features of Open Transport in Mac OS 9 are:

- Stability and performance have been improved.
- Copy stall problems should not occur over TCP/IP connections while transferring large blocks of data.
- The number of Open Transport library files has been reduced to two thereby reducing clutter in the extensions folder.
- Mac OS 9 includes a client/server version of ARA.
- Dial on demand performance has been improved.
- Corrects some problems affecting various third party wireless modems.
- Some internal changes to fix Dynamic Host Configuration Protocol (DHCP)-related pausing behavior.
- DHCP packets are now more compatible with Windows NT DHCP servers and other types of DHCP servers.

Published Date: Feb 20, 2012

Mac OS 9: What‘s New - Drive Setup 1.8.1

Drive Setup is the application that formats, partitions, and tests the Apple hard drives. Drive Setup also installs and updates the hard drive driver on Apple hard drives.
This article has been archived and is no longer updated by Apple.
The new features of Drive Setup 1.8.1 in Mac OS 9 are:

- You can format drives to use the Unix File System (UFS) with Mac OS X, Mac OS X Server, A/UX, LinuxPPC and MkLinux for PowerPC. Mac OS 9 does not use UFS-formatted volumes.
- Drive Setup is now installed inside a folder in the Utilities folder called "Drive Setup f". This folder contains Drive Setup and Drive Setup Guide. Drive Setup can be custom-installed from the Mac OS 9 installer.

UFS Formatting
You can format drives using the Unix File System (UFS) format. This is the file system used by Mac OS X Server and other unix-style operating systems that run on computers made by Apple. Mac OS uses Mac OS Standard (HFS) and Mac OS Extended (HFS Plus) format

To get to custom formatting options, highlight the volume you want and click on the Initialize button.

Drive Setup's partitioning schemes are predefined groupings of volume types. The volume types are for specific uses (in the case of A/UX and Linux) and may include small Mac OS (Standard or Extended) partitions for Mac OS Partitioning Schemes:

- Mac OS UFS
- Mac OS Server UFS
- Default MkLinux
- Preferred MkLinux
- Preferred LinuxPPC
- Default A/UX

What's the difference between Mac OS UFS and Mac OS Server UFS?
Mac OS UFS is for Mac OS X. Mac OS Server UFS is for Mac OS X Server and can only be chosen when running MacOS.app in Mac OS X Server.
Published Date: Feb 20, 2012

Mac OS 9: What‘s New - Speakable Items

Speakable Items is the set of commands that you can speak for your computer to perform. This feature is sometimes called "Speech Recognition" or "PlainTalk".
This article has been archived and is no longer updated by Apple.
Speakable Items 2.0 in Mac OS 9 now includes the following new features:

- There is a speakable commands window.
- Speakable Items can be application-specific.
- Accuracy is improved.
- There are new speakable items.
- You can make AppleScripts use speech recognition by using the AppleScript Listener scripting addition.
- Speakable Buttons and checkboxes.
- Speech control panel changes.

Speakable Items uses speech recognition to recognize when you say the name of the speakable item and open the file with that name. These are predominately AppleScripts or compiled applications that are named as commands that describe their action. For example: "Close this window" would be the name of the item that closes the front window.

You can now have speakable items that are specific to a particular application. You can make any application speakable by using the "Make this application speakable." command.

Accuracy is improved with Mac OS 9 also because Speakable Items adjusts to constant noise (CPU fans, air conditioners, electric hums). Irregular noise (TV, radio, talking) will likely still be a problem)

You can now speak the names of most buttons (OK, Cancel), Radio buttons and checkboxes. You cannot speak items from a menu bar or pop-up menu.
Published Date: Feb 20, 2012

Mac OS 9: Troubleshooting Speakable Items

This article provides troubleshooting tips for Speakable Items.
This article has been archived and is no longer updated by Apple.

Speech Recognition doesn't work at all. It doesn't hear or respond.
Check the obvious. Make sure the microphone works by recording an alert sound in the Sound control panel. Make sure that Speech Recognition is turned on in the Speech control panel (or in the Control Strip).

Speech Recognition hears but doesn't seem to respond or it "hears" the wrong thing.
Speech recognition is designed to recognize normal volume, continuous speech in the North American English dialect. Pausing unnaturally or speaking too loud or too soft, too slow or too fast will cause it to be less accurate or to fail. Over-enunciating or pausing between words is not helpful. Speak naturally. If Speech Recognition is hearing something, you should see some animation in the feedback window. The kind of animation varies.

1. Sit in front of the computer in a typing position.
2. Place the microphone on top of your monitor. Optimum distance is about 50 cm from your microphone.
3. Speak at a normal volume, tone and speed. If you have some success with Speech Recognition, you're likely to have more success.
4. Say "What time is it" and 'What day is it". If those work, then the computer should have tuned itself for you. It only takes about 3 seconds to tune itself.

My custom speakable items aren't recognized or don't work.
Custom speakable items with longer names are easier to recognize because they're more distinctive than shorter names. You may want to rename document and folder aliases. Try pasting the name of the file in Simple Text so it can speak the file. What is says is what it's listening for (generally speaking).
Published Date: Feb 20, 2012

Mac OS 9: What‘s New - Multilingual Internet Access 2.0 and Language Kits

Multilingual Internet Access is the software that allows you to view and edit text in WorldScript-aware applications from one or more of the following language families: Arabic (Arabic and Persian), Cyrillic (Bulgarian, Russian, Ukrainian), Central European (Polish, Hungarian, Czech), Indic (Devanagari, Gujarati, and Gurmukhi), Hebrew, Japanese, Korean, Simplified Chinese, Traditional Chinese.
This article has been archived and is no longer updated by Apple.
Mac OS 9 adds an input method for each of Japanese, Korean, Simplified Chinese and Traditional Chinese languages. An input method refers to a way to use a keyboard with 26 (or so) letters to enter characters in a character-based language that may have thousands of characters.

- New language scripts are supported with this version.
- The Cyrillic Language Kit supports Bulgarian, Russian, and Ukrainian.
- The Central European (CE) Language Kit supports Polish, Hungarian, Czech, and Slovak.

Language Kits
A language kit is a product that allows you to type text in languages which do not use the Roman alphabet using English (or other Roman) keyboards and Mac OS versions. Instead of the 26 (or so) characters that Roman alphabets use, non-Roman alphabets use other alphabets or character sets of many thousands of characters.

Apple includes the latest versions of each language kit in Mac OS 9.

As of Mac OS 9, the following language kit-specific extensions are no longer necessary: Language Kit Extension and WorldScript II. Note that the WorldScript I extension is still installed (and needed).

The Language Kit CD Extras folder on the Mac OS 9 CD includes extra fonts for each language kit and a version of SimpleText for that works with that language kit.

What a language kit does not do

- A language kit does not translate between languages.
- A language kit does not change the language that your system software uses.
- A language kit does not enable speech recognition or text to speech in other languages.

In order to be able to use a language kit, you need an application that can deal with languages that use non-roman characters, right-to-left word order and other features. Apple's system-level technology to make this easy is called WorldScript. Applications that make use of WorldScript are called WorldScript-savvy applications. You need WorldScript-savvy applications for Language Kits to work.

DO NOT install older versions of language kit on Mac OS 9.
Published Date: Feb 20, 2012

Mac OS 9: What‘s New - Apple Verifier

This article describes the Apple Verifier, an application included with Mac OS 9.0.
This article has been archived and is no longer updated by Apple.
The Apple Verifier can be used to ensure that a file you have received is the same file the author intended you to get; that is, the file has not been corrupted, altered or infected with a virus. Signed files include a digital certificate and a signature. The Apple Verifier uses these tools to help determine who originally created a file and to make sure that the file hasn't been corrupted. This verification process can help you avoid running applications containing viruses. This process doesn't take the place of using virus protection/detection software, but it gives you a chance to detect viruses before they are "set free" on your system.

You can only verify files that have been signed. Only developers can get the tools from Apple Developer Support to sign files. A signed file has a new icon badge that looks like a medal.
Published Date: Feb 20, 2012

Mac OS 9: File Security - Forgotten Passphrase

I have forgotten the passphrase for a file that I encrypted with Apple File Security. Is there a way I can decrypt the file anyway?
This article has been archived and is no longer updated by Apple.
There is no way to decrypt the file without the passphrase. Apple Computer, Inc. is unable to retrieve a forgotten passphrase.
Published Date: Feb 20, 2012

Mac OS 9: Multiple Users - Tips For Creating a Secure Voice Password

This article contains tips for creating a secure voiceprint for the multiple users feature of Mac OS 9.
This article has been archived and is no longer updated by Apple.
The more similar your voice recordings are to each other, the more secure your voiceprint will be. Try to make each recording as similar to the others as you can. If there is background noise during the recording, the computer will expect it during each voice login.

Do the following:

- Speak at a normal rate. Trying to "help" by over-enunciating or inserting pauses between each word will cause it to fail.
- Speak at a normal volume. - Trying to "help" by speaking too loudly or too softly will cause it to fail. You will be alerted if this is the case.
- Speak at a normal distance from the microphone (about 50 cm). If you are too close or too far, it's as bad as speaking at an abnormal volume.
- Position the microphone on top of the monitor.

The computer will alert you if you speak too loudly or too softly, or too close to the end of the recording. It will try to guide you into making a good sound by making helpful suggestions.

Mac OS 9: Multiple Users - Voice Password Stopped Working

I've been using the same voice password for a while, but it's stopped working. How can I get it to work again?

This article has been archived and is no longer updated by Apple.

While you may not hear it, the more you practice saying your voice password, the more your voice will change the way you say it. The computer notices these subtle changes, however. If this happens, the voice password appears to stop working. To solve this, record a different voice password to use.

Macintosh Manager/Multiple Users: Can‘t Open Some Control Panels

This article describes an issue where users are unable to open networking control panels after logging in using Multiple Users.
This article has been archived and is no longer updated by Apple.

Symptom

Users logged in using Multiple Users are not able to open the Multiple Users, AppleTalk, TCP/IP, Remote Access, or File Sharing control panels.

Solution

This is normal behavior. Network settings are specific to each computer-not to each user. Only the owner can make changes in these control panels.

Note: Normal users that are allowed to manage user accounts can open the Multiple Users control panel (using Mac OS 9.x).

If Normal, Panels or Limited users must change network settings, consider using Location Manager as described in Article 60657: "**Mac OS 9: Location Manager and Multiple Users**."

Mac OS 9: Multiple Users - Voice Password Doesn‘t Work On PowerBook 5300

Can I use the voice password in the multiple users feature of Mac OS 9.0?
This article has been archived and is no longer updated by Apple.
It is not possible to use a Voice Password on PowerBook 5300 computers. You must use a typed password instead.
Published Date: Feb 20, 2012

Mac OS 9: What is the Type 1 Scaler?

What is the Type 1 Scaler in the Extensions Folder?
This article has been archived and is no longer updated by Apple.
Type 1 Scaler uses Type 1 PostScript fonts to draw smooth fonts on the screen in applications that use Apple Type Services for Unicode Imaging (ATSUI). Type 1 Scaler does for ATSUI applications what Adobe Type Manager (ATM) does in traditional QuickDraw applications.

Unless you have an ATSUI enabled application, you can disable the Type 1 Scaler to free up about 1 megabyte of memory.

Mac OS 9: Using Programmable Keyboard Function Keys

This article outlines which computers can use the programmable function key feature of Mac OS 9.
This article has been archived and is no longer updated by Apple.
Programmable keyboard function keys only works on computers that have the ROM-in-RAM feature (iMacs, iBooks, PowerBook G3 Series (Bronze Keyboard), Power Macintosh G3 (Blue and White), Power Macintosh G4 (all models) and later computers). Other computers do not have this button in their Keyboard control panel.

Mac OS 9: What‘s New - Sound Control Panel

This article describes the new features of the Sound control panel in Mac OS 9.0.
This article has been archived and is no longer updated by Apple.
New features of the Sound control panel in Mac OS 9 include:

- New control panel
- More alert sounds
- Sound Input changes
- New Speaker Setup pane
- Sound Output pane changes - 3D Stereo sound on some computers

More Alert Sounds

- Chu Toy
- Glass
- Laugh
- Logjam
- Pong2003
- Purr
- Submarine
- Temple
- Uh oh
- Voltage

Retired Alert Sounds

- Droplet
- Quack
- Wild Eep

Sound Input pane
On some computers (those that have an ATAPI CD-ROM and ROM-in-RAM) Audio CDs now always play through regardless of your setting in the Sound Input pane in the Sound control panel. However, if you want to record a CD, you'll have to change the sound input setting to Internal CD.

Speaker Setup
There is an additional option for Speaker Setup that allows you to pick certain speakers and adjust their relative volume.

Mac OS 9: What‘s New - File Exchange 3.0.2

File Exchange allows you to set mappings from filename extensions (ex.: ".TXT") to Mac OS file types (ex.: 'TEXT'), to mount DOS SCSI disks and drive containers, and to set File Translation preferences.
This article has been archived and is no longer updated by Apple.
The new features of the File Exchange control panel in Mac OS 9 are:

- Provides better support for PC-formatted 120 MB Imation SuperDisk disks
- File Exchange no longer allows a space as a disk name. This would disable the disk.
- Provides less confusing information and better appearance during online mount.
- Accommodates the new HDI driver (1.4.1).
- Fixed problems reformatting PC disks in Mac formats

Mac OS 9: Application Quits Because "An Update Is Required"

Whenever I use certain applications, I see the following error message:
"The application<application name> has unexpectedly quit, because an update to this software is required for compatibility with the improved Mac OS file system.
"You should save your work in other open applications and restart the computer.
"You should contact the developer of the software that quit to see if an update to ensure compatibility with Mac OS 9 is available."

These applications worked fine with Mac OS 8. Why don't they work with Mac OS 9?
This article has been archived and is no longer updated by Apple.
In order to modernize the Mac OS's foundations, Apple greatly increased the number of files that can be open from 348 in Mac OS 8 to 8169 in Mac OS 9. The total number of open files includes many files used by the system, such as fonts, and files used by applications, such as documents, and so forth.

This change means that you can install many more fonts and other system resources without running into the 348 open file limit. Unfortunately, it also means that some programs that relied on an outdated method to access the system will fail to work.

Any program could be prone to encounter this error, but for the most part, applications that worked in Mac OS 8 but that won't work in Mac OS 9 fall into the following categories:

- disk utilities
- file compression
- font management
- virus utilities

Apple has long provided a programming method (API) for software developers to access the system without causing an error. The only programs that display this error are the ones that use the outdated API. Many software publishers plan to release updated programs that work with Mac OS 9, and can take advantage of the increased number of open files that is allowed.

Check with your program's publisher to see if an updated version is available. The following article can help you search for a particular vendor's address and phone number:

Mac OS 9: How to Set up Epson Printers for Multiple Users

This article explains how to set up Epson printers when Mac OS 9's Multiple Users feature is turned on.
This article has been archived and is no longer updated by Apple.
In order for users to print to Epson printers when the multiple users feature of Mac OS 9 is turned on, the user "Owner" must allow access to "All Printers" for other users. A user in the Limited or Panels environment should set up the Epson printer driver to use a spool folder located in the user's folder, or another location where the user can create files, such as the User's Documents folder.

To do this follow these steps:

1. Log in as a Limited or Panels User.

2. Choose Print Desktop from the Finder's File menu. If logging in as a Panels User, open an Application that the Panels User may print from (such as Appleworks 6), and select Print from the Application's File menu.

3. In the Print dialog box that appears, click the Utility button provided by Epson (this button has a tools icon).

4. Click Configuration.

5. For both the Temporary Spool and Temporary High Speed Copies folder locations, click Select and navigate to the following: Macintosh HD > Users > [user's name] folder > Documents folder

6. Click Select Documents.

7. Click OK.

8. Click OK.

9. Click Cancel.

Mac OS 9: Adobe Type Manager, Type Reunion Compatibility, Error -119

Important news about Mac OS 9 and Adobe Type Manager (ATM), ATM Deluxe, and Adobe Type Reunion (ATR) Deluxe.

This article has been archived and is no longer updated by Apple.

Symptom

An alert box appears with error -119.

Solution

Download and install ATM 4.6, ATM Deluxe 4.6, and ATR Deluxe 2.5.2.

ATM 4.6, an updater from ATM Deluxe 4.5 to 4.6, and an updater from ATR Deluxe 2.5 to 2.5.2 are available from Adobe at http://www.adobe.com/support/downloads/main.html. You can find information about upgrading ATM Deluxe 4.0x and ATR Deluxe 2.0x to the latest versions at http://www.adobe.com/products/atm/main.html.

To temporarily get your computer running without the error alert box, start up while holding down the Space bar; the Extensions Manager opens. Disable the ATM control panel, then click Continue to continue the startup process.

Note: Earlier versions of Adobe Acrobat do not work with Mac OS 9. For more information, please see article 60571: "**Mac OS 9: Using Acrobat PDF Documents.**"

Article 17159: "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

Mac OS 9: Color StyleWriter 4000 Series Requires Updated Driver

Color StyleWriter 4000 Series printers require an updated printer driver to work with Mac OS 9.
This article has been archived and is no longer updated by Apple.
Apple Color StyleWriter 4000 Series printers require an updated printer driver to work with Mac OS 9. The Mac OS 9 installer deletes the Color StyleWriter 4000 series driver when you install Mac OS 9. This is normal. The old software does not work and should not be installed.

The updated printer driver for the Apple Color StyleWriter 4000 Series printers can be downloaded from Apple Software Updates at http://www.apple.com/swupdates/ .

Article 75083 "**Color StyleWriter 4000 Series: About CSW 4000 Series Drivers**" contains the Read Me document for the new driver.

Mac OS 9: Use Disk First Aid 8.5.3 and Drive Setup 1.8.1

I am trying to launch Disk First Aid and Drive Setup under Mac OS 9, but I keep getting an error message that "The application program cannot be launched because it cannot be run on this computer."
This article has been archived and is no longer updated by Apple.
If you attempt to launch a version of Disk First Aid or Drive Setup that is older than the version included with Mac OS 9 you will receive this error message. The version of Disk First Aid included with Mac OS 9 is 8.5.4. The version of Drive Setup included with Mac OS 9 is 1.8.1.

These applications are installed in the Utilities folder of the same drive as the Mac OS 9 System Folder. If you cannot locate these versions or newer versions of these utilities, you can custom install Disk First Aid and Drive Setup from the Mac OS 9 installer.

Mac OS 9: Where‘s the Users & Groups Control Panel

Where is the Users & Groups control panel in Mac OS 9.0? Was it not installed?
This article has been archived and is no longer updated by Apple.
The Users & Groups control panel is part of the File Sharing control panel in Mac OS 9.0.
Published Date: Feb 20, 2012

Mac OS 9: Not Supported In MacOS.app

Can Mac OS 9.0 be installed in the MacOS.app (a.k.a. "Blue Box") on Mac OS X Server?
This article has been archived and is no longer updated by Apple.
No, Mac OS 9.0 is not compatible with the MacOS.app on Mac OS X Server. However, It can be used with Mac OS X Server's NetBoot feature.

Note: NetBoot images on Mac OS X Server require a Mac OS 9 license for each NetBoot client.
Published Date: Feb 20, 2012

Mac OS 9: File Sharing Owner Password Field Shows 8 Bullets

I typed my password into the Owner Password field in the File Sharing control panel and it shows eight bullets. My password is only 5 characters long. Why is it showing the wrong number of bullets?

This article has been archived and is no longer updated by Apple.

In Mac OS 9.0, the owner password field shows the same number of bullets (8) regardless of the actual length of the password. This makes the owner's password harder to guess.

Published Date: Feb 20, 2012

Mac OS 9: What Is the Servers Folder in the System Folder?

With Mac OS 9, the Servers folder in the System Folder stores aliases to file server volumes that you have chosen to automatically open at system startup time.

This article has been archived and is no longer updated by Apple.

When you connect to an AppleShare or File Sharing file server you can usually choose to have the computer automatically connect to a shared volume at system startup time. With Mac OS 9, the Servers folder in the System Folder holds the aliases to these shared volumes. The system attempts to connect to the servers whenever you start up the computer.

For related information on this topic, refer to document 25214: "**Mac OS 9: Brief Delay When Desktop First Appears**"

Published Date: Feb 20, 2012

Mac OS 9: Multiple Users - No Sleep Option At Login Screen

My computer is configured to use the multiple users feature of Mac OS 9.0. I can't find a button or command to put the computer to sleep. Is there one?

This article has been archived and is no longer updated by Apple.

There is not a sleep option at Mac OS 9.0's login screen. You can shut down the computer, or log in and then put the computer to sleep. The screen will dim if you leave the login screen alone, however.

Published Date: Feb 20, 2012

Mac OS 9: Folder Protection Disabled in General Controls

The Folder Protection check boxes in the General Controls control panel are disabled. How can I get them to work?

This article has been archived and is no longer updated by Apple.

In Mac OS 9.0, these features are disabled. If you need to protect files and applications, you should use Mac OS 9.0's multiple users feature to limit access to the computer.

Published Date: Feb 20, 2012

Mac OS 9: File Security - Can‘t Unlock Keychain

I can't unlock my keychain even though I'm sure I'm using the correct password. What could be wrong?
This article has been archived and is no longer updated by Apple.
Possible solution:

You have disabled the file security extensions and need to turn them on.

1. Open the Extensions Manager

2. Make sure these files are turned on: Security Cert Module, Security Library, Security Manager, Security Policy Module, Security Storage Module.

Published Date: Feb 20, 2012

Mac OS 9: Multiple Users - Alternate Password Panel Is Disabled

The Alternate Password panel is disabled for each user in the Multiple Users control panel. How can I turn it on?
This article has been archived and is no longer updated by Apple.
The Alternate Password panel is enabled when you allow users to use a voiceprint password.

1. Open the Multiple Users control panel.
2. Click Options.
3. Check Allow Alternate Password.

Apple Customer Global Internet Privacy Policy

This article outlines Apple's Internet privacy policy.
This article has been archived and is no longer updated by Apple.
Apple Customer Global Internet Privacy Policy

Protecting your privacy is important to Apple, Inc. ("Apple"). We hope the following policy will help you understand how Apple collects, uses, and safeguards the personal information you provide on our web site.

Information Collection

If you browse Apple's web site, you do so anonymously. We don't collect personal information - including your e-mail address. We do log your IP address (the Internet address of your computer) to give us an idea of which parts of our web site you visit and how long you spend there. But we do not link your IP address to anything personally identifiable. The only other information automatically provided to us is the type of computer and operating system you are using. Your browser supplies us with this information.

Like many other commercial web sites, the Apple web site may use a standard technology called a "cookie" to collect information about how you use the site. Please go to http://www.apple.com/legal/privacy/aboutcookies.html for more information.

At times we may request that you voluntarily supply us with personal information, such as your e-mail address and postal address, for purposes such as corresponding with us, registering at a site, making a purchase, entering a sweepstakes, registering a new product, or participating in an online survey. When you register a product with Apple, for example, we collect the serial number and your name, address, and e-mail address.

We will use the personal information you provide to create a personal ID, called Apple ID. Your Apple ID gives you easy access to Apple services including product registration and the Apple Store. Here's how it works. Using a unique identifier (your current e-mail address and a password for security), you fill out your Apple profile with information you feel comfortable sharing with us, such as your name and telephone number. Once you enter your information, your Apple ID saves you time when you order something from the Apple Store or register a new product. You simply enter your Apple ID and password, and the system looks up the information it needs.

Because Apple, Inc. operates globally, we make company information available to our worldwide business units. As part of this process, the personal information that you have provided to us may be sent to other Apple business units around the world. However, we do not share your profile with anyone else outside of Apple without your consent, and no one else can access your information. Using your Apple ID and password, you can easily delete, edit, or change your personal information and preferences at any time.

Information Use

If you provide us with your e-mail or postal address, or have done so in the past, we will ask you if we can use it to send you updates on the latest Apple products and promotions. We also ask if you want us to share your personal information with other companies that offer related services. If you do not want us or other companies to contact you, you can choose to "opt out," and Apple will respect your wishes.

We may use information that you have given us to learn more about our customers so that we can develop better products and services. We may also use the information to inform you about new products, services, and offers that may be of interest to you. These offers may be based on information you provided in your initial transaction with us or in surveys.

Declining E-mail Offers

Apple provides customers with an easy means to decline to receive e-mail offers. Although most customers tell us they appreciate receiving notice of these opportunities, we recognize the importance of providing you with choices. At any time, you may request to discontinue receiving these offers from us by simply replying to the e-mail and informing us of your preferences. All e-mail offers that you receive from Apple will tell you how to decline further e-mail offers.

Children

While Apple's product ad campaigns and marketing materials are often viewed by children, we do not solicit data from them. Apple encourages parents and guardians to spend time online with their children and to participate in the interactive activities offered on the sites their children visit. No information should be submitted to, or posted at, Apple's web site by visitors under 18 years of age without the consent of their parent or guardian.

Company Commitment to Privacy

Apple is actively involved in current industry initiatives -- such as the Online Privacy Alliance (http://www.privacyalliance.org)-- to preserve individual privacy rights on the Internet and in all aspects of electronic commerce.

Apple, Inc.'s privacy policy is subject to change at any time and without notice. Please check http://www.apple.com/legal/privacy for updates.

Mac OS 9: Multiple Users - How to Disable Extensions Manager

This document describes how to turn off Extensions Manager in a Multiple User environment.
This article has been archived and is no longer updated by Apple.
Network users can gain access to the Extensions Manager control panel by holding down the space bar when restarting the computer. However, they cannot disable the Multiple Users environment from within the Extensions Manager unless they are the administrator.

If you do not wish for users other than the administrator to gain access to the Extensions Manager control panel in this way, you should manually disable the "EM extension" extension located in the Extensions folder of the System Folder. This extension appears near the top of the listing if the extensions folder is viewed by name. You must manually drag this extension out of the Extensions folder since it does not appear in the Extensions Manager control panel under Mac OS 9.
Published Date: Feb 20, 2012

Mac OS 9: Font Manager Update No Longer Needed

I had installed the Font Manager Update extension under Mac OS 8.6, do I still need this extension if I'm running Mac OS 9?
This article has been archived and is no longer updated by Apple.
The Font Manager Update extension was created specifically for Mac OS 8.6. The issue it addressed has been corrected and the fix is included in Mac OS 9.0 as part of the System Suitcase or Mac OS ROM file (depending on the Macintosh model). You do not need to re-install the font update extension, and it is safe to remove this extension if you are running Mac OS 9.0.

If you believe you may have a damaged font resource as a result of previously running Mac OS 8.6, you can still run the Font First Aid application included as part of the Font Manager Update 1.0 package under Mac OS 9.0 to search for and repair damaged font resources.

Be careful not to confuse the "Font Manager Update" extension with the "Font Updater Extension" which is part of the Language Kit installation package included with Mac OS 9.0. If you are using a language kit under Mac OS 9.0, leave the "Font Updater Extension" installed.

Font First Aid is also not the same application as the Font Updater utility that is installed as part of the Language Kit installation package. For more information on Font Updater, see Tech Info Library article:

Article 60557: "**Mac OS 9: About the Font Updater for Language Kits.**"

Mac OS 9: Multiple Users - Owner Name Or Password Change

After creating a voice print alternative password for the administrator user, I changed information in the File Sharing Control Panel. Now voice authentication for the owner is not working correctly.
This article has been archived and is no longer updated by Apple.
Changing the owner name or password in the File Sharing Control Panel will cause the multiple users owner information, that was originally known, to not match the new settings.

If you just changed the password, the voice password dialog will appear, but after successful authentication, the type password dialog will appear. If the name was changed, the voice password dialog never shows and the type password is presented instead.

Multiple Users must be opened to resynchronize information. If just the password was changed, then opening Multiple Users and changing the password for the owner will resync the Voice Verification database. If the owner name or owner name and password are changed, then the owner will need to recreate a voice print.

Mac OS 9: About the Font Updater for Language Kits

This article contains answers to commonly asked questions about the Font Updater, which is included with Mac OS 9.
This article has been archived and is no longer updated by Apple.
Question 1: What does the Font Updater do?

Answer: Many older 2-byte (Chinese, Japanese, and Korean) fonts were created in a format that stored 'fbit' bitmapped data in files outside the font's suitcase, in the root level of the System Folder. With Mac OS 8.5 and later, Apple moved to an improved data structure for 2-byte fonts, storing all the font data within the font's suitcase.

If you are using Mac OS 9, and have custom installed any of the 2-byte Language Kits, you already have the latest Apple fonts. If you have older third party 2-byte fonts which use fbit data, convert them using the Font Updater utility.

If you still see fbit files inside your System Folder after you have used the Font Updater, this is normal, and was done to maintain compatibility with some older applications that still look for the fbit files.

Question 2: When is the Font Updater utility installed?

Answer: If you are using Mac OS 9, and have used the Mac OS 9 Custom Install option to install the Chinese, Japanese, or Korean Kits, the Font Updater application and the Font Updater extension are both installed, in the Utilities and Extensions folders, respectively.

Question 3: What does the Font Updater Extension do?

Answer: If there are any fonts in the Fonts folder of the System Folder which need to be updated, they will be updated during startup when the Font Updater Extension loads. An indicator bar will appear showing the progress of the update for each font which is being updated.

Question 4: Is this utility related to the Font Manager Update for Mac OS 8.6?

Answer: No. The Font Manager Update 1.0 corrects unrelated issues with character height in some 2-byte fonts and font corruption. If you are using Mac OS 8.6, you should install Font Manager Update. The functionality of Font Manager Update 1.0 is incorporated into Mac OS 9.

Important: See also the following Tech Info Library article:

Article 60468: "**Mac OS 9: Do Not Install Older Language Kits**"

For more information about the Font Manager Update for Mac OS 8.6, see the following Tech Info Library article:

Mac OS 9: Tips For Using Voice Verification and Speak Your Name

This article is intended to answer frequently asked questions and to provide general tips for using Voice Verification and Login under Mac OS 9. This article has been archived and is no longer updated by Apple.
Question: I cannot get the "allow users to speak their names" option to work on my computer. The Voice Verification option works fine, so I know my microphone is connected and working. What am I doing wrong?

Answer: Speech Recognition must be installed, and you must use the settings established in the Speech control panel in order for the voice login feature to work correctly. Check to see what the microphone is set to in the Speech control panel, or try using Speakable Items from the Finder to see if Speech Recognition is working correctly. If the Speech control panel is set so that users must say "Computer" before speaking a command, then at the log in screen you must say "Computer," followed by the user's name to log in as well.

If you do not have Speech Recognition installed, you can re-install it from the Mac OS 9 installer.

You may want to consider instructing users on how to use the voice login feature by changing the text of the welcome message. The option to change the welcome message text is available in the Multiple Users control panel under Options.

Question: When I try to record a voice password, it says that my password is "too soft."

Answer: Password phrases that are too short can sometimes be misinterpreted by the computer as being too soft. The Voice Verification setup process should warn you if you type a password phrase that it feels is too short. Try using the default password phrase, or try establishing a longer phrase during setup to avoid problems using a voice password during login.

Question: Do I have to speak the text of the Voice Verification password in order for the password to work?

Answer: Yes, although you can change the text of the phrase you should speak the exact text of the chosen phrase in the Voice Verfication setup. The computer uses this phrase along with the four voice samples taken from you during the setup to create a more accurate voiceprint. If you do not want other users to know what phrase you use, there is an option not to display the text of the Voice Verification phrase at log in during the Voice Verification setup.

You should also avoid altering the way you speak the verification phrase during the Voice Verification setup process. Speak naturally and consistently during each sample. The more that you change your intonation between each recording, the more likely the computer will not successfully establish an accurate voiceprint.

iMovie 2: How to Import Non-DV QuickTime Movies

This document explains how to import non-DV QuickTime movies into iMovie.
This article has been archived and is no longer updated by Apple.
iMovie is designed to get all video clips by capturing them directly from a digital video (DV) device. If you want to use video from other sources they must first be converted into DV streams.

The following steps apply to iMovie and iMovie 2. For iMovie 3 see technical document 61816 "**iMovie 3: How to Import a QuickTime Movie**."

With QuickTime Pro, you can convert a QuickTime movie into a DV stream.

1. Open the QuickTime movie in QuickTime Player.
2. Choose Export from the File menu.
3. In the Export pop-up menu, select Movie to DV Stream. Use the Default Settings.
4. Type a name for your DV movie and click Save.
5. Drag the newly saved DV movie into the Media folder of your project. **Note:** The DV clip may be much larger than the original QuickTime movie. Make sure you have enough space on your hard disk.
6. Open iMovie. You will see the following dialog box:

Figure 1 iMovie dialog

7. Click OK. The DV clip will be imported to the Shelf. If the shelf is already full, you may see a different dialog saying that the shelf is full. Delete some files from the Shelf, or move them to the timeline to make room for the new clip which will then appear on the Shelf.

For information on how to upgrade to QuickTime Pro, visit the QuickTime website (http://www.apple.com/quicktime/).
Published Date: Feb 20, 2012

Files split at 1.9 GB (about 9 minutes) when capturing clips in iMovie 5 or earlier

This article has been archived and is no longer updated by Apple.

When importing media using iMovie 5 or earlier, large video and audio files will be split into multiple clips in the Shelf. Each clip of DV video has a maximum length of about 9 minutes.

iMovie saves imported video in large, full-quality DV format. Because DV clips contain a lot of data, they can be very large files.

Earlier versions of Mac OS had a file size limitation of 2 gigabytes (GB). For compatibility with earlier versions of Mac OS, iMovie does not create files larger than 2 GB when it imports media. If you exceed this limit by capturing a clip that is very long, iMovie splits the clip, and continues capturing into another clip, and continues doing this until the capture is completed. The maximum length of an individual DV movie clip in this case is limited to approximately 9 minutes. The length of other media will vary depending on the type of data.

To play back multiple clips as a single sequence when editing your movie, drag the clips to the Timeline in the correct order.

iMovie: About Transition and Title Clip Progress Bars

This document describes iMovie's transition and title clip progress bars.
This article has been archived and is no longer updated by Apple.
Since iMovie renders transition clips and title clips as they are placed in the Clip Viewer, you will not see a regular progress bar dialog box. Instead, a red progress bar for individual transition clips and title clips is displayed within the clip's icon in the Clip Viewer. This allows you to render several transition clips or title clips at the same time.

A transition clip's red progress bar appears in the lower part of the transition icon visible in the Clip Viewer. The transition icon is the image that connects the "transition from" clip and "transition to" clip to each other.

The title clip's red progress bar appears just above the title clip's name. The title clip progress bar is about 20 percent of the way up from the bottom of the title clip's Clip Viewer icon.

Additional clips may be added to the Clip Viewer while other clips are rendering -- up to the point where a certain percentage of available memory is consumed. At that point, no additional transition clips or title clips may be added. Once the clips' progress bars have reached the right side of their clip icon the rendering process is finished, and additional transition clips or title clips may be added to the Clip Viewer.

Mac OS 9: Iomega Driver and Virtual Memory

This article provides important information about using an Iomega volume for virtual memory under Mac OS 9.

This article has been archived and is no longer updated by Apple.
Mac OS 9 allows you to use removable media (such as an Iomega Jaz drive) for virtual memory.

If you want to install Mac OS 9 onto a Zip or Jaz disk, you should use a non-removable volume for virtual memory. To do this, hold down the Shift key while choosing Restart from the Special menu (to disable your extensions). Then open the Memory control panel and turn on virtual memory. Select a volume that is compatible with virtual memory as the virtual memory volume.

Mac OS 9: Reinstalling StyleWriter Printer Drivers

This article provides important information about printing with Mac OS 9.
This article has been archived and is no longer updated by Apple.
If you do a clean installation of Mac OS 9 and an icon for your printer is not available in the Chooser, you may need to reinstall the software that came with your printer.

- If you have a StyleWriter, StyleWriter II, or StyleWriter 1200, use the StyleWriter 1500 driver that comes with Mac OS 9 (instead of installing your original printer software).
- If you have a Color StyleWriter 2200 or 2400, install the Color StyleWriter 2500 driver that comes with Mac OS 9 (instead of installing your original printer software).

You may also need to reinstall fonts that came with your printer software. Follow the instructions that came with your printer software.

Note: If you have a Color StyleWriter 4100 or 4500 series be aware that Mac OS 9 does not include a compatible driver for these printers, and you should not install an older driver. For more information, see the following Knowledge Base article:

Article 60537: "**Mac OS 9: Color StyleWriter 4000 Series Requires Updated Driver.**"

Mac OS 9: Possible "Port in use" Error With Palm Desktop 2.5 Installed

This article provides important information about the "Port in use" error message that may appear when using Mac OS 9 with Palm Desktop 2.5 software installed.
This article has been archived and is no longer updated by Apple.

Symptom

When using Mac OS 9 with Palm Desktop 2.5 software installed, and setting up the Internet or American Online (AOL) connection, a "port in use" error message may appear.

Solution

1. Turn off the Palm Desktop HotSync.
2. Open HotSync Manager by selecting the Palm Desktop icon in the menu bar (next to the Applications menu).
3. Choose Setup from the HotSync menu.
4. If necessary, select the HotSync Controls tab.
5. In the HotSync section, click the button next to Disabled and deselect the checkbox titled: 'Enable HotSync software at system startup.'

To obtain the latest version of AOL software, connect to AOL and go to the keyword Upgrade.

Mac OS 9: Pause With Password Security

I installed Mac OS 9.0 and now when I turn PowerBook Password Security on or off using the control panel, the cursor temporarily freezes for a couple of seconds. Is this normal?

This article has been archived and is no longer updated by Apple.

Yes, this is normal. When Password Security is turned on or off (and when the setup dialog is opened) it resets the ATA bus. As of Mac OS 9.0, the CD/DVD driver supports bus resets and so responds with a short delay. This won't happen if there is a disc in the CD-ROM drive and it doesn't happen on PowerBook G3 Series (Bronze) models. This does not affect the functionality of Password Security at all.

Published Date: Feb 20, 2012

Mac OS 9: PowerBook Doesn‘t Sleep With TCP/IP File Sharing Enabled

Under Mac OS 9, sometimes my PowerBook won't go to sleep after the time set in the Energy Saver control panel has elapsed. Why is this?
This article has been archived and is no longer updated by Apple.
If the following conditions are present, your PowerBook may not go to sleep automatically:

- File Sharing over TCP/IP is enabled
- File Sharing is on
- the PowerBook is on the Internet

You can put the PowerBook to sleep manually, however. The reason the PowerBook does not go to sleep automatically is because TCP/IP file sharing probes the computer name periodically, which can in turn reset the timer for automatic sleep.

Mac OS 9: Using Software Update With VPN/Connection "Keep-Alive" Agents

This article describes the interaction between the Software Update feature (introduced in Mac OS 9) and certain "keep alive" Internet connection software.
This article has been archived and is no longer updated by Apple.

Symptom

After the Software Update control panel presents a list of updates and you click Install, nothing appears to happen and the updates are not installed.

Solution

Do not use the "Update software automatically" feature of the Software Update control panel if the use of a "keep alive" application is required to maintain your Internet connection. Follow these steps instead:

1. Click Update Now in the Software Update control panel.
2. Note the updates that Software Update lists.
3. Connect to the Apple Software Downloads site at http://www.apple.com/downloads/.
4. Download and install each update.

The Software Update feature quits all open applications as part of its preparation to install or update components. Some network connections require an active application to maintain the connection. Virtual Private Network (VPN) clients, and cable modem connections that require a "keep-alive" agent are usually instructed to quit by the Software Update mechanism thereby removing the means for the actual update to be performed. Provisions for several commonly known applications of this kind have been made in order for them to function with Software Update. However, VPN and cable modem authentication mechanisms often differ in their implementation and may require custom client applications. The Software Update mechanism may fail if such a custom application is required to obtain (and maintain) a network connection.

Mac OS 9: Where is "Connect To..."?

The functionality of the Connect To applet has been integrated into the Network Browser application. This article explains how to access it, and how to create your own 'Connect To' applet.
This article has been archived and is no longer updated by Apple.
The "Connect To..." applet, which is included with Mac OS 8, is not installed with Mac OS 9. Its functionality has been integrated into the Network Browser application.

To connect to a specific URL, open the Network Browser from the Apple Menu and choose "Connect To Server" from the Shortcuts button.

If you still wish to use the Connect To... applet, you can copy it from a computer running Mac OS 8.x, or you can create your own Connect To... applet and even expand its capabilities using AppleScript.

Here are two example Applescripts (type option-L to produce a Â¬ character):

Example 1

```
display dialogÂ¬
       "Enter an internet address (URL) to connect to:" default answerÂ¬
       "http://www.apple.com/" buttons {"Cancel", "Connect"}Â¬
       default button "Connect"

set theURL to the text returned of the result
open location theURL
```

Example 2

```
choose URL
open location the result
```

You can save either of these scripts as a run-only application (set to never show startup screen) from the Script Editor application included with Mac OS 9. For more information about AppleScript, see Mac Help, or visit http://www.apple.com/applescript.

AppleShare IP 6.3: Problems Accessing The Server Over TCP

This article provides troubleshooting information for AppleShare IP 6.3.
This article has been archived and is no longer updated by Apple.

If you can't access any services over TCP from any client computer:

- Check the settings in the server's TCP control panel. Make sure the IP address, subnet mask, router address, and Configure settings match those given to you by your network administrator. You can also check TCP settings by trying to connect to your Web site with a Web browser. If you can, TCP settings are correct.
- If the TCP settings appear to be correct:
  - Make sure Ethernet is working by checking the status lights on your Ethernet hub or switch.
  - Check to be sure routers are working by using software that can "ping" network devices. Pinging lets you check whether a network device (such as a router or a computer) is online. You can find out more about ping and other tools on the AppleShare IP Web site
  - If you have turned on TCP filtering using the TCP Filter Admin application but have not added any additional filters, all access to your server is denied by default. You need to do one of the following:
    - Turn off TCP filtering.
    - Add new filters to your filter list that allow access to computers that have the IP addresses you specify.

If only a few client computers can't access the server over TCP:

- Check the settings in the client computer's TCP/IP control panel. Make sure the IP address, subnet mask, router address, and Configure settings match those given to you by your network administrator.
- Make sure Ethernet is working by checking the status lights on the Ethernet hub or switch to which the client computer is connected.

AppleShare IP 6.3: Problems Logging On Using Web-based Remote Admin

This article provides troubleshooting information for AppleShare IP 6.3.
This article has been archived and is no longer updated by Apple.
Web-based Remote Admin lets you use a Web browser to manage many of the AppleShare IP services.

If your password doesn't work:

- Your password must consist only of 7-bit characters (the standard ASCII character set). Use Mac OS Server Admin to change your password.
- If you use Netscape to log on to Web-based Remote Admin, use the Shift key, not the Caps Lock key to enter uppercase characters in a password.

If you are unable to connect through a Web browser:

- Make sure file services are running on the computer that's acting as your Web server.
- Make sure Web service is turned on.
- Make sure remote administration is enabled (in the General panel of the Web Server Settings window).
- Make sure you've entered the correct URL into your Web browser program (http://<your Web server's DNS name>/.admin)
- Make sure you've enabled your Web server plug-ins by selecting "Enable Plug-ins" in the Plug-Ins panel of the Web Server Settings window.
- If you've configured your Web server for a single domain, make sure the Remote Admin folder is located inside your default Web folder. If you move, rename, or delete the Remote Admin folder or its contents, you may not be able to connect.
- If you've configured your Web server to support multiple domains, you must move the Remote Admin folder from the default Web folder to the Web folder specified in the first entry of your Multi Domain Settings file. To access Remote Admin, you must use the DNS name or IP address specified in the first entry in the Multi Domain Settings file.
- Make sure you haven't set up TCP Filter Admin to restrict access to Web-based Remote Admin from your computer's IP address.
- Make sure your Web browser has Java enabled.
- Try quitting your browser program, then open it again and enter the URL for Web-based Remote Admin.

If you log on to Remote Admin and are asked to log on again:

- If you press the Reload button in your browser, you must log on again.

If you see a "404" error message:

- Reinstall the Remote Admin folder on your server.

If you see a "504" error message:

- Try adjusting the current file server activity to less than the maximum. The Remote Admin CGI may not be getting enough processing time.
- Try disabling any proxies in your browser and try again. There may be a network configuration error.

If you see an error message with no number:

- Make sure you've entered the correct URL and try again.

If you receive proxy timeout errors when you try to make changes using Web-based Remote Admin:

- Ask your proxy server administrator to give you Write access for the Web server.
- If this is not possible, then disable any proxies in your browser and select the option to connect directly to the Internet.

Published Date: Feb 20, 2012

AppleShare IP 6.3: Serial Number Issues

This article provides troubleshooting information for AppleShare IP 6.3.
This article has been archived and is no longer updated by Apple.
When you set up AppleShare IP, you need to provide the serial number on the sticker included with your AppleShare IP materials. You'll also need the serial number if you have to reinstall your computer's software, or if you're having problems with your serial number. A serial number looks similar to this:

A-111-BBB-222-CCC-333-DDD-444-EEE-555

Important: For convenience, your serial number comes printed on a small adhesive label. Don't put the adhesive label on a removable media disk. The label could come loose and damage the drive.

You've lost your serial number

If you lose your AppleShare IP serial number before you set up AppleShare IP, contact the appropriate Apple support representative in your area or contact AppleCare Technical Support to request a new serial number. You'll need to provide your identification and purchase information.

Displaying your serial number

If you lose your serial number after you start your AppleShare IP server, follow these steps to display your serial number:

1. Open Mac OS Server Admin and log on to the server you want to configure.
2. Click File Services.
3. Choose Configure File Server. Your serial number appears in the General panel.
4. Write down the serial number and store it in a safe place. Put a photocopy in another location, too.

You see "duplicate serial number" or conflict alerts

When the AppleShare IP server starts up, it checks your computer's network for other computers using the same serial number. If no matching number is found, your serial number is encrypted and registered on the network. If the AppleShare IP server detects a matching serial number, it displays a message. When you click OK, the server program quits.

If you have AppleShare IP 6.3.3, the Mac OS Server Admin modules do not load if a duplicate serial number is detected. An error message appears for each module (see Figure 1).

Figure 1 Error text generated by Mac OS Server Admin

Your computer may detect a duplicate serial number on the network if:

- An administrator typed the wrong number during setup.
- An administrator made a copy of an existing computer's Users & Groups Data File on another computer but did not type the new serial number for it.
- Someone else used your serial number in violation of the license agreement.

If you see the duplicate serial number message, try these suggestions:

- Be sure your serial number is correct. Follow the steps above to display your serial number, then check it against the number provided with your software.
- Find the computer with the incorrect serial number. Contact the administrator of the other computer as soon as possible. Ask that person to check the serial number for his or her software and make any needed corrections. If necessary, contact the administrator of your entire network for help in locating, checking, and correcting the serial number.
- Use network tracking and analysis software to locate the duplicate of your software.
- Your software can help locate the duplicate software. You need to convert the other computer's name and zone into an AppleTalk network address and use that address to find the computer's physical location on the network.
- Follow the network cables and check each computer. When you know the AppleTalk network address for the computer that is running the

duplicate software, identify the physical location of the network cable that matches the network address. This location will probably give you a good idea where the computer is located. If you still can't find the computer, follow the cable along its path, checking each attached computer to see if it's the duplicate. A network topology map may help you in your search.

- If you can't contact the other computer's administrator and you do not have network tracking and analysis software, see the Apple Software Service Directory that came with your AppleShare IP software for information about contacting the appropriate support representative for your area. Apple's support representatives will help you determine if a new serial number is needed. Be prepared to provide your identification and purchase information.
- After you've found the computer with the duplicate serial number, change the serial number to the correct one for that server, or purchase an additional license with a new serial number. Only a user who has administrative privileges can change the serial number.

AppleShare IP 6.3: Unexpected Crashes or Shutdowns

This article provides troubleshooting information for AppleShare IP 6.3.
This article has been archived and is no longer updated by Apple.
If any of your servers stop working (the system "freezes" or locks up), or if any administration programs unexpectedly quit, try the following:

- Run Disk First Aid or another disk repair utility program that is compatible with the version of Mac OS on each of the server volumes.
- Verify that your software is compatible with the version of Mac OS on your server.
- If you have virus protection software installed, try removing or disabling the software.
- If you do not have virus protection software installed, use a virus-detection program or similar utility to check for viruses and other disk problems.
- Turn off extensions not supplied by Apple. Hold down the Space bar while restarting the server, then when the Extensions Manager opens, turn off extensions from other software manufacturers and let the startup continue. Restart the AppleShare IP servers you were using. If the problem doesn't recur, use the Extensions Manager to turn on one of the extensions. Restart the server and let it run for an extended period of time. If the problem doesn't recur, turn on the next extension, restart the server, and let it run. Eventually you may find an extension that seems to cause problems with your server. Leave that extension turned off.
- Make sure the invisible AppleShare PDS files are not damaged and reconstruct them if necessary. Each AppleShare IP volume contains an invisible AppleShare PDS file that retains folder access privileges. If you are unable to change the access privileges for a folder or volume, you can replace the damaged file with a backup copy.
- Verify that any PCI cards installed in your computer are properly installed (or "seated") in their slots. Make sure that the internal cables for PCI cards have no bent pins and are not being pinched. Replace the cables if necessary. For instructions, see the documentation that came with your server hardware.
- Verify that installed random-access memory (RAM) is properly seated. You may need to remove and reinstall the RAM. For instructions, see the documentation that came with your computer.
- Verify that your hardware and cables are properly connected. Make sure any SCSI devices are properly connected and that the SCSI cables do not exceed maximum cable lengths. For instructions, see the documentation that came with your computer and devices.

If the problem still exists:

1. Reinstall your AppleShare IP software following the instructions in the documentation that came with your software.
2. Make a backup copy of the PDS file after you've created your share points and assigned access privileges.

AppleShare IP 6.3: A User Is Having Trouble Sending Mail

This article provides troubleshooting information for AppleShare IP 6.3.
This article has been archived and is no longer updated by Apple.

- If the mail is addressed to a user who connects to the same mail server, verify that mail is enabled for the addressee.
- Make sure that the user's e-mail application is properly configured for your network with the correct mail server name, e-mail address, and so on.
- Check the Mail Server Activity window. If the number of active users and the number of users sending mail is always high, there may be too many users trying to connect at the same time. Try allocating more memory to mail services.
- Make sure that there is enough free space on the volume where the mail database is located.
- Check the size of the mail the user is trying to send; the mail server may limit the size of messages. You can change incoming mail restrictions to allow larger messages to your server.
- Check the mail server log to see if there is a pattern of failed connections for the mail server.
- If the destination is a computer for which you provide DNS service, check the MX record on the DNS server. If you change the MX record, remember that DNS caches must be flushed before the change takes effect.
- Make sure SMTP mail is enabled on your server. The default SMTP port is 25. See Changing mail protocol settings.
- Make sure that the mail server and the user's computer are using the same DNS server. (The DNS server is specified in the TCP/IP control panel.) If they are using different DNS servers, make sure the MX records match on both DNS servers.

Published Date: Feb 20, 2012

AppleShare IP 6.3: A User Is Having Trouble Receiving Mail

This article provides troubleshooting information for AppleShare IP 6.3.
This article has been archived and is no longer updated by Apple.

- Check the user's e-mail address. If the user name contains spaces, then you must set up an Internet alias to use as the e-mail address.
- Make sure mail is enabled for the user and the user's mail is not set to be forwarded to another address.
- Make sure the DNS mail system is configured correctly by checking with your network administrator or Internet service provider. If you are using Mac DNS to provide DNS, check the MacDNS Administrator's Guide, in the MacDNS folder inside the AppleShare IP 6 folder on the server's hard disk.
- If the user's mail account is set up for an APOP-encrypted password, make sure that the user's mail application is also set up for APOP.
- If the user is having trouble receiving replies to mail that he or she sent, make sure that the user's e-mail address is correctly set up in the mail application's return information field.
- If you are sharing users and groups and have set up a user's mail account on a secondary server (by typing that server's DNS name in the Mail Account Location text box), make sure you've followed all of the steps to set up users and groups on a secondary server and to run the mail server on a secondary server. Then make sure the user's e-mail application is configured to log on to the correct server.

AppleShare IP 6.3: Users Cannot Connect To The Mail Server

This article provides troubleshooting information for AppleShare IP 6.3.
This article has been archived and is no longer updated by Apple.

- Make sure the mail server is running. See Starting and stopping the mail server.
- Make sure the users' e-mail applications are properly configured for your network.
- Try allocating more memory to the mail server.
- If users are connecting to the mail server over TCP, check the connection between the user's computer and the server using a utility that allows you to "ping" the computer. (If users are connecting over AppleTalk, make sure they can see the mail server in the Chooser.) You can find out more about ping and other tools as well as troubleshooting here.
- Check the Mail Server Activity window. If the number of active users and the number of users sending mail is always high, too many users may be trying to connect at the same time.
- If other services are running on the same computer as the mail server, the server may be too busy. Consider adding more RAM to the computer or moving the mail server to another computer.
- If you are sharing users and groups and have set up a user's mail account on a secondary server (by typing that server's DNS name in the Mail Account Location text box), make sure you've set up the secondary server properly. Then make sure the user's e-mail application is configured to log on to the correct server.
- Make sure you haven't blocked access to the mail server's ports for these users using TCP Filter Admin.

AppleShare IP 6.3: You Can‘t Attach a Printer To a Queue

This article provides troubleshooting information for AppleShare IP 6.3.
This article has been archived and is no longer updated by Apple.

- Someone may be using the printer. If so, wait for the job to finish printing. Use the print utility that came with the printer to check the printer's status.
- Make sure the printer has paper and is working properly (doesn't have a paper jam and is ready for printing).
- If you're printing over TCP/IP, make sure that the attached printer supports the LPD protocol (also referred to as LPR). See the documentation that came with your printer.
- Make sure the printer supports LaserWriter driver 8.4 or later.
- Try turning the printer off and on again.
- Make sure that the printer is visible on the network by looking for it in the Chooser (if it is connected over AppleTalk), or using a "pinging" utility (if it is connected over TCP/IP). If you can't find the printer, there's a problem with your network connections. Check the server's AppleTalk or TCP/IP settings, or ask your network administrator if there's a problem with the network.

Published Date: Feb 20, 2012

AppleShare IP 6.3: A Printer Can‘t Be Found

This article provides troubleshooting information for AppleShare IP 6.3.
This article has been archived and is no longer updated by Apple.
When a printer attached to a queue can't be found on the network, an alert icon appears next to the printer name in the Queue Monitor window. Take the following steps:

- If the printer is not printing a document, turn the printer off and then on again. Check the name of the printer on the startup page.
- If someone has changed the printer's name, rename it or attach the printer again under its new name. For information on renaming, see the documentation that came with your printer.
- If you're printing over TCP/IP, make sure that the attached printer supports the LPD protocol (also referred to as LPR). See the documentation that came with your printer.
- If you're printing over TCP/IP, check the printer's network connection using a "pinging" utility.
- After checking the above, try reattaching the printer to the queue.

Published Date: Feb 20, 2012

AppleShare IP 6.3: A Document Can‘t Be Queued

This article provides troubleshooting information for AppleShare IP 6.3.
This article has been archived and is no longer updated by Apple.
If a user receives a message that a document can't be queued, or if a document can't be sent to the print server, check the following:

- Make sure the user is printing to a print server queue. Print queues are listed in the Chooser (for AppleTalk connections), the printer-selecting software (for Windows users), and the Desktop Printer Utility (for TCP/IP connections).
- Check the print server log for errors.
- Verify that the disk on which the print server stores jobs is not full.
- Make sure that Enable Queuing is selected, and that AppleTalk and TCP/IP printing are enabled for the queue.
- If users are trying to print to a queue that contains an older printer, check the print queue settings to make sure "Allow binary data" is not selected.
- If only Windows clients can't print, make sure the LPR/LPD settings in the Windows printing utility are correct. Also make sure the IP address and queue name are entered properly. The queue name is case-sensitive; however, the Windows client may show the name in all caps.
- If you've limited who can print to a queue, make sure that the user has been given printing access and that the printer driver installed on his or her computer allows secure printing. (The Desktop Printer Utility, for example, does not allow secure printing.) Make sure the user types the user name and password you've assigned (check the File Sharing control panel on the user's computer). Check the Security menu in the Print dialog box to see if a different name has been saved as default.
- If users are trying to print to a queue over TCP/IP, make sure printing over TCP/IP is enabled in the Protocol panel of the Print Server Settings window. Also, make sure that the server's TCP/IP settings are correct.
- If users are trying to print over TCP/IP and they've entered the DNS name of the print server into their TCP/IP utility, DNS may not be working. Try entering the IP address instead. Make sure the queue name does not include any spaces and case is correct.
- If only one person has reported problems printing, see if you can print from another user's computer. If you can, there may be problems with the first user's TCP/IP or AppleTalk settings. If multiple users cannot print, check whether the users have other file sharing or TCP/IP services available. If not, there may be a problem with your network.
- On the user's computer, try printing from another application. The problem may be related to the application or document.
- Try printing directly to the printer, or to a different printer or queue.
- If the print server's queues aren't listed in the Chooser or other printer-selecting software, check your network connections. Refer to the documentation for your networking hardware and software to answer any questions about setting up and solving problems with the network.

Published Date: Feb 20, 2012

AppleShare IP 6.3: A Document Can‘t Be Printed

This article provides troubleshooting information for AppleShare IP 6.3.
This article has been archived and is no longer updated by Apple.

- The PostScript printer description (PPD) file for the queue may be inappropriate for the document. For each queue, the print server uses the PPD file for the first printer attached to the queue. If you attach subsequent printers that have different capabilities, documents that require those capabilities may not print, even when they are assigned to the correct printer. Create a separate queue for the printer you want to print to and try printing again.
- Check the Queue Monitor for the queue to make sure the print job is not on hold.
- If no other printer is available, make an attached printer visible on the network. Have the user print directly on the printer by selecting its name in the Chooser or in the printer-selecting software (for Windows).
- If the user is printing binary data, make sure that the "Allow binary data" checkbox is selected in the General panel of the Print Queue settings window and that the printer supports printing binary data. Some older printers don't support printing binary data.
- If the user still can't print the document, consult the manual that came with the printer and the documentation that came with the program.

AppleShare IP 6.3: About Sharing, Share Points, and Access Privileges

This article provides troubleshooting information for AppleShare IP 6.3.
This article has been archived and is no longer updated by Apple.

About sharing and share points

A shared item is a document, folder, or disk that can be accessed by users who connect to the file server. You determine which users can access the item and how they can use it.

A share point is a folder, hard disk, or CD-ROM disc that contains shared items. Items in a share point by default have the same access privileges as the share point, but you can give them different access privileges if you wish.

You cannot have a share point within a share point. See the illustration:

Figure 1, Share point folder diagram

About access privileges

You can assign three levels of user access privileges to a share point or shared item. Access privileges determine what users can do with a shared item. Access privileges apply to all users except AppleShare IP administrators.

Adopted versus explicit access privileges:
By default, a folder within a share point or shared item "adopts" access privileges of the enclosing share point or shared items. If you move the folder, its access privileges change to match the new location.

You can also assign "explicit" access privileges to a folder. When you move a folder that has explicit access privileges, its access privileges stay the same. See the illustration:

Figure 2, Access privileges illustration

Access privileges you can assign:

You can assign the following access privileges to a shared item:

- Read & Write privileges allow a user to open a disk or folder and see, open, copy, delete, move, create, and change the files inside.
- Read Only privileges allow a user to open a disk or folder and see, open, and copy the folders and files inside (but not move or change them).
- Write Only privileges allow a user to put items into the shared area but not see or use any items inside (an item with Write Only privileges is also known as a drop box).
- None: If no privileges are assigned, the user cannot open the item, see or change its contents, or add content.

How access privileges appear to users:
How access privileges appear to a user depends on the version of operating system software on the user's computer.

Windows file sharing users can set folder properties, but not privileges.

Users of AppleShare Client software or Mac OS 8.0 or later can set access privileges for folders they own using the Sharing command in the Finder's File menu. When users of earlier versions of system software set privileges, the file server translates them as follows:

User setting	Privileges
See folders, See files, Make changes	Read & Write
See folders, See files	Read
See folders, Make changes	Write Only
Make changes	Write Only

See files, Make changes	None
See folders	None
See files	None

About user categories

You assign access privileges separately to three user categories:

Owner

The administrator (owner of the computer running AppleShare IP) by default owns all volumes and folders and has Read & Write access to all shared items on the computer running AppleShare IP.

A user who creates a new folder on the file server is its default owner. The folder inherits the privileges of the enclosing folder (unless the administrator changes the privileges settings).

The owner of an item is the only user who can change its access privileges.

User/Group

One user or one group can be assigned special access privileges for a shared item.

Everyone

All users who can log on to the file server: registered users, guests, anonymous FTP users, and Web visitors.

If a user is included in more than one category, the following rules apply:

Owner privileges override User/Group privileges.

User/Group privileges override Everyone privileges.

For example, when a user is both the owner of a shared item and a member of the group assigned to it, the user has owner access.

AppleShare IP 6.3: Users Can‘t Connect To Your Web Site

This article provides troubleshooting information for AppleShare IP 6.3.
This article has been archived and is no longer updated by Apple.

- Make sure that the Web server is turned on.
- Make sure that the correct folder is selected as the default Web folder. Make sure that the correct HTML file is selected as the default document page.
- For the default Web folder, make sure that Read Only access privileges are assigned to the Everyone category.
- Verify that users' computers are configured correctly for TCP. Check each user's TCP/IP control panel. If there doesn't appear to be a problem with the TCP/IP settings, use a "pinging" utility that allows you to check network connections.
- Verify that the problem is not a DNS problem by trying to connect with the IP address of the Web server instead of its DNS name.
- Make sure users are entering the correct URL to connect to the Web server.
- Make sure your DNS server's entry for the Web server's IP address and domain name are correct.
- If you have set up multiple Web sites, make sure you have configured the Multi Domain Settings file correctly and performed any other necessary steps.
- If your Web site is restricted to specific users, make sure those users have access privileges to your Web site.
- Make sure your Web site is available on the Internet.
- If users see a Java error and use Internet Explorer, tell them to make sure that Java Virtual Machine is selected in the Java section of the Internet Explorer Preferences window.

Mac OS 9: File Sharing Security

This document gives tips for sharing files securely in Mac OS 9.
This article has been archived and is no longer updated by Apple.
You should make good security decisions when sharing your files, whether it be via AppleTalk on a local area network (LAN) or on the Internet (TCP/IP). Keep the following in mind no matter which networking protocol you choose to use:

- Choose good user names and passwords that include alphanumeric characters.
- Do not share your entire startup disk. Rather, share folders that are necessary or a secondary disk that is dedicated to storage.
- Encrypt sensitive files using the Encrypt command in the Finder's File menu.
- When setting privileges, be careful about what you allow guests to access on your computer. If at any time you wish to disable guest access, use these steps:
    1. Open the File Sharing control panel.
    2. Click on the Users & Groups tab.
    3. Click the user "Guest" then click Open.
    4. Choose Sharing from the Show pop-up menu.
    5. Make sure "Allow guests to connect to this computer" is **not** checked.

Published Date: Feb 20, 2012

Mac OS 9: RAM Disk Considerations When Installing On Computers With 32MB RAM

An issue can occur when doing an upgrade install of Mac OS 9 from Mac OS 8.1, 8.5 or 8.6 on a computer with minimal RAM.
This article has been archived and is no longer updated by Apple.
If you have a computer with the minimum 32 megabytes of RAM and also have a large RAM disk defined, say 75 percent of available memory, then Mac OS 9 will freeze or behave strangely upon restarting after upgrading.

The computer will start up and then either freeze at the Happy Mac or display a grey screen and freeze. The dedicated RAM disk does not leave enough memory for Mac OS 9 to run. It's possible to recover from the startup freeze by restarting and resetting PRAM.

This issue can be avoided by reducing the size of the RAM disk before installing Mac OS 9. Larger memory configurations should not encounter this situation.
Published Date: Feb 20, 2012

Mac OS 9: File Sharing Over TCP/IP Requires AppleTalk To Be Active

This article explains why AppleTalk must be active even when trying to perform file sharing using TCP/IP.
This article has been archived and is no longer updated by Apple.
AppleTalk must be active to use the implementation of TCP/IP filesharing included with Mac OS 9. If you do not want AppleTalk active over your network connection, you can set the AppleTalk control panel to another port such as "Remote Only."
Published Date: Feb 20, 2012

Mac OS 9: Where Is The Monitors & Sound Control Panel?

After installing Mac OS 9, I can no longer find the Monitors & Sound control panel.
This article has been archived and is no longer updated by Apple.
As of Mac OS 9, the Monitors & Sound control panel has been replaced with two separate control panels: The Monitors control panel and the Sound control panel.

Note: If you have an AppleVision AV or AudioVision monitor, the controls for the speakers built-into your monitor are located in the Monitors control panel (click on the Monitor Sound button).
Published Date: Feb 20, 2012

Mac OS 9: Multiple Users - Rebuilding The Desktop File

I'm trying to rebuild the Desktop, by holding down Command-Option as the Finder opens, but the keys seem to be ignored.
This article has been archived and is no longer updated by Apple.
This can happen if Multiple Users is enabled and a limited Finder account is being used instead of a owner Finder account.

The simple way to recognize that Multiple Users is enabled is that either a login screen is present, or for a logged in user that the Special menu has a Logout command as the last choice. Note that only the computer's owner user can disable Multiple Users.

To rebuild the desktop under Multiple Users you must log in as a normal Finder account (it does not have to be the owner), and then hold down the Command-Option after entering the password, either by voice or by typing. You will then receive the usual message "Are you sure you want to rebuild the desktop file on the disk 'Macintosh HD'?"
Published Date: Feb 20, 2012

Mac OS 9: No Error When Software Update Can‘t Quit Applications

When the Software Update control panel says there is an update, and I ask it to install it, the control panel hangs when trying to quit other applications.

This article has been archived and is no longer updated by Apple.

Software Update first tries to quit all non-background applications, by bringing them to the foreground and sending them a quit request (AppleEvent). Software Update then waits until the application quits. If after waiting for a period of time the requested application has not terminated, Software Update assumes there is some problem or delay in quitting the application, and it terminates the update action without issuing any message. Software Update will likely be the frontmost application after this has happened.

To workaround this, quit all applications, responding to save document dialogs as necessary. When all applications have quit, then initiate the Software Update operation.

Published Date: Feb 20, 2012

Mac OS 9: Netscape Will Not Open

An alert with one of the following messages when you open Netscape Communicator:

"The application Netscape Communicator has unexpectedly quit, because an update to this software is required for compatibility with the improved Mac OS file system"

- or -

"An Error of Type -119 occurred."

This article has been archived and is no longer updated by Apple.

Symptom

An alert with one of the following messages when you open Netscape Communicator:

> "The application Netscape Communicator has unexpectedly quit, because an update to this software is required for compatibility with the improved Mac OS file system"

- or -

> "An Error of Type -119 occurred."

Solution

Remove the Talkback folder from the Netscape folder.

For more information about this error message and Mac OS 9 compatibility, see article 60533: "**Mac OS 9: Application Quits 'Because An Update Is Required.**"

Mac OS 9: Multiple Users - Microsoft Applications Won‘t Launch

I have set up a number of panels users and have noticed that when they open Internet Explorer 4.5, the computer will not open the application or will sometimes appear to be frozen. What can I do to prevent this?
This article has been archived and is no longer updated by Apple.
Some Microsoft applications, including Internet Explorer 4.5 and Office 98 components, will open an installer or self-repair application the first time they are run. This application will in turn attempt to place items in the System Folder, to which the user may not have access privileges. When setting up multiple users it is also likely that you gave the user access to the Microsoft application you wanted the user to be able to run, but did not give the user access to the Microsoft First Run application.

To avoid this issue, launch any applications such as Internet Explorer, Excel, Word and PowerPoint at least once from the owner environment before giving a Limited or Panels user access to that application.

This issue is not limited to only Microsoft applications, but can happen with any program that uses a similar installation method. It is a good idea to install applications from the Owner environment and to make sure each application runs correctly in the owner environment before giving other users access to the application.

For additional guidelines on setting up a Multiple Users environment, refer to Mac Help from the Help menu.
Published Date: Feb 20, 2012

Mac OS 9: DVD Player Will Not Play After Clean Installation

I installed Mac OS 9 on my Power Mac G4 and now it will not play any DVD movies.

This article has been archived and is no longer updated by Apple.

Apple DVD Software 2.0 Available

Some Power Macintosh G4 and iMac computers shipped with Apple DVD 2.0 Beta 2 software. A final release of Apple DVD Software 2.0 is available from Apple Software Updates sites. We strongly recommend updating to the final 2.0 version available from the Apple Software Updates Web site at http://www.apple.com/swupdates.

If You Are Using Apple DVD 2.0 Beta 2 Software

On Power Macintosh G4 and iMac computers that shipped with Apple DVD 2.0 Beta 2, performing a clean installation of Mac OS 9 can result in the Apple DVD Player not working. Instead, you are presented with the message:

> The application "Apple DVD Player" could not be opened because "DVDRuntimeLib" could not be found.

If you do not update to the final release of the software (as mentioned above), you can solve the issue by dragging the DVD components in the previous Extensions folder over to the new Extensions folder and restarting. Follow these steps:

1. Open the Previous System Folder on your hard drive. This was the active System Folder before performing the clean installation.
2. Open the Extensions folder within the Previous System Folder.
3. Select "as List" from the View menu so that the items are in alphabetical order.
4. Option-drag (hold down the Option key while dragging) the following items from the old Extensions folder (the one within the Previous System Folder) onto the current, closed System Folder. The files will be auto-routed to the correct folder within. (Avoid lingering over the System Folder while dragging or Mac OS spring loaded folder facility may open the folder):
   - DVD Navigation Manager
   - DVD Region Manager
   - DVDRunTimeLib
5. Restart the computer.

The Apple DVD Player should now function properly.

If you have initialized your computer's hard disk, or have erased the Previous System Folder that was created during the clean installation, you will not be able to follow the steps outlined above. However, a disk image of your computer's hard disk as it was shipped from the factory is located on the CD (disc) that came with your computer. By mounting that hard disk image, you can drag the necessary files from its System Folder to your Mac OS 9 System Folder. Follow these steps:

1. Insert the Power Mac G4 or iMac Restore CD that came with your computer.
2. Open the Configurations folder located on the disc.
3. Double-click the "Power Mac G4 HD.img" or "iMac HD.img" file. Accept the agreement and wait for the progress bar to complete.
4. Locate on the Desktop an icon that looks like floppy disk titled Macintosh HD.
5. Double-click this icon, locate the System Folder.
6. Drag the following items from the disk image's Extensions folder to the current, closed System Folder on your computer's hard disk:
   - DVD Navigation Manager
   - DVD Region Manager
   - DVDRunTimeLib
7. Open the Applications folder on the disk image.
8. Drag the "Apple DVD Player" folder to the Applications folder on your hard drive, replacing the old one.
9. Restart.

The Apple DVD Player should now function properly.

If you use the Extensions Manager to use the "Mac OS 9.0 All" or "Mac OS 9.0 Base" extension sets, DVD video will not work. You must also enable the three DVD extensions in the Extensions folder.

Note: In Mac OS 9, the Apple DVD Player is no longer listed in the Apple menu. It can be found in the Applications folder. You can put an alias to the Apple DVD Player in the Apple Menu Items folder if you wish. Apple DVD Player 2.0 is required to view DVD movies on these computers. If an earlier version is in the Application folder, then you will have to install it as well. Do this by moving the newer player over from the hard drive image in the Configurations folder on the Restore CD.

Update Using AppleScript

This AppleScript can update your new system folder using the components from the Previous System Folder.

1. Open the Launcher control Panel and click the Script Editor button.
2. Paste the following AppleScript into a new Script Editor window and run it:

--- Copy the following --

```
tell application "Finder"

set BootDrive to name of startup disk
set SysFldr to system folder as text
set ExtFldr to SysFldr & "Extensions:" as text
set DVDExists to every file in folder ExtFldr whose name starts with "DVD"

-- Are DVD files already installed?
if DVDExists is not {} then
set DVDInstalled to "Apple DVD Software is already installed"
display dialog DVDInstalled buttons {"OK"} with icon note

else
set PrvSysFldr to BootDrive & ":Previous System Folder:" as string

-- the previous System Folder still around?
if folder PrvSysFldr exists then
set PrevExtFldr to (PrvSysFldr & "Extensions:" as text) -- yes
else
-- locate it
choose folder with prompt "Locate your previous System Folder"
set PrvSysFldr to the result as text
set PrevExtFldr to PrvSysFldr & "Extensions:" as text
end if

--copy the old extensions to the new System Folder
select (every file of folder PrevExtFldr whose name starts with "DVD")
duplicate the selection to system folder

--copy the AMI item to the new Apple Menu Items folder
set PrevAMIFldr to PrvSysFldr & "Apple Menu Items:" as text
duplicate file "Apple DVD Player" of folder PrevAMIFldr to ¬
folder "Apple Menu Items" of system folder with replacing
set RestartMsg to ¬
"You need to restart to enable usage of the Apple DVD Player."
display dialog RestartMsg buttons "OK" default button 1 with icon caution

end if
end tell
```

-- End Selection and paste this into your Script Editor --

This AppleScript will copy the necessary Extensions and the alias for Apple Menu as well. It will tell you whether the files appear to have already been copied (if you have done it manually or run the script once already). If the Previous System Folder has already been removed, it can also be used to locate the System Folder on the mounted disk image from the secondary recovery method above and copy the files from there.

Note: This AppleScript has been compiled and is available at:

ftp://ftp.info.apple.com/Apple_Support_Area/Apple_Software_Updates/English-North_American/Macintosh/Misc/AppleScript/Install_DVD_SW.bin

Mac OS 9: Why Does The Sound Control Panel Show Headphones Attached?

Why does the Speaker Setup portion of the Sound control panel show headphones attached when I have no headphones hooked up to my computer?
This article has been archived and is no longer updated by Apple.
Under Mac OS 9, the Sound control panel has several new aspects to it, one being the ability to check your speaker setup when you have either headphones or speakers plugged into the speaker port.

The picture of the headphones is a representation for any device connected to the speaker port of the computer. The Sound control panel will always show the headphones picture no matter what device you have plugged into the speaker port.

The same does not hold true for speakers hooked up to the USB port. For example, the speaker setup will not only see USB speakers but it also has the ability to see USB sub-woofers, if they are attached.

Mac OS 9: Update Firmware Before Installing

When trying to update to Mac OS 9 I receive a message during installation that the computer's firmware is out of date. However, when I try to update the firmware I receive a message that I cannot do this because my System Folder is locked. What should I do?
This article has been archived and is no longer updated by Apple.
Possible solution:

You must install the firmware update before installing Mac OS 9.

1. Start up the computer from its hard disk (not from the Mac OS 9 Install CD).
2. Follow the instructions for updating your firmware in the CD Extras folder on your Mac OS CD.
3. After the computer's firmware has been updated, start up the computer from the Mac OS 9 Install CD and proceed with the installation.

When you update the firmware, certain modifications are made to the System Folder. When your computer is started up from the Mac OS 9 install disc, the firmware program is unable to make those modifications because the disc is locked.

Mac OS 9: Is Compatible With MacPoET 1.1

MacPoET 1.1, software that provides PPP over Ethernet (PPPoE), is compatible with Mac OS 9.

This article has been archived and is no longer updated by Apple.
MacPoET 1.1, software that provides PPP over Ethernet (PPPoE), is compatible with Mac OS 9. Only your Internet Service Provider (ISP) can provide the software to you. If you are using an earlier version of MacPoET, contact your ISP for an update.

Mac OS 9: No Sound From Apple Video Player

I'm trying to use Apple Video Player to watch TV using Mac OS 9, but I can't hear anything.
This article has been archived and is no longer updated by Apple.
Possible solution:

You need to set the input source before opening the Apple Video Player application. To do this, choose the sound input setting you wish to monitor from the sound input control strip (such as tv/cd/video), then open the Apple Video Player application. Now, you should be able to hear the sound that accompanies the video signal.

Mac OS 9: Multiple Users - Startup Items Folder Is Not Configurable By Restricted Users

As a restricted (limited or panels) user, I cannot configure my own Startup Items folder or Shutdown Items folder.
This article has been archived and is no longer updated by Apple.
This is a design limitation in the first release of Multiple Users. Normal users can configure their Startup Items folder and Shutdown Items folder. Only the Owner can configure the Startup Items folder and Shutdown Items folder for Limited and Panels user accounts.

Examples of situations of where this will be noticed are:

- The Startup Items / Shutdown Items folder, when opened, will have the No-Write access icon shown in the Finder window, preventing any changes by Limited or Panels users.
- The General Controls Control Panel fails, with no error message, to create an alias to the Launcher for Normal or Limited users. The Owner can configure Launcher startup through General Controls. Normal Users can work around this situation by creating an alias of the Launcher in their Startup Items folder (which is inside the User's Folder). Limited users will need the Owner to create an alias of the Launcher in their Startup Items folder (which is inside the User's Folder). Panels users cannot use the Launcher, because it has Finder dependencies.
- Stickies fails with an informative error message (-5000) when trying to create an alias in the Startup Items. This error will occur for Limited and Panels users only. Restricted (Limited or Panels) users who would like Stickies to appear on startup, need the Owner to create an alias to Stickies in their Startup Items folder (which is inside the User's Folder)

Note: Stickies application will successfully access the Startup Items folder when used in conjunction with Multiple Users 1.4.1.

Tip: For the Owner's convenience, if File Sharing is active, the creation and deletion of aliases could be accomplished by accessing the volume over a network to create and remove aliases in the Startup Items folder or Shutdown Items folder for restricted users.

Apple plans to remove this limitation in a future update of Multiple Users for Mac OS 9.

Mac OS 9: USB Adapter Card Support

I've installed Mac OS 9, but am now unable to use a PCI USB adapter card in my Power Macintosh. The vendor of my adapter card(s) has referred me to Apple.
This article has been archived and is no longer updated by Apple.
In some instances it may be necessary to re-install the latest version of USB Adapter Card Support after installing Mac OS 9 in order to restore function for USB PCI Adapter cards.

The latest version of USB Adapter Card Support can be obtained from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Mac OS 9: Hard Disk "Unrecognized" Message When Starting Up From Mac OS 9 CD

When installing Mac OS 9 by starting up from the Mac OS 9 CD, some hard disks behave as if they are damaged and unreadable, when in fact they are not. This article describes the exact symptom and offers the solution.
This article has been archived and is no longer updated by Apple.

Symptom

When starting up from the Mac OS 9 Installation CD (by pressing the 'c' key during startup), a dialog box may appear stating that the computer's hard disk is unrecognizable and asks if you would like to initialize (erase) it.

Products Affected

- Any version of Mac OS 9

Solution

Apple has identified an issue with a limited number of hard disks that result in this message when starting up from the Mac OS 9 CD. The files and directory structure on these drives are not modified or damaged in any way. To resolve the situation:

1. Click Cancel in the dialog box.
2. Restart from hard disk, making sure the Mac OS 9 CD is still in the computer.
3. Open the Startup Disk control panel and select the Mac OS 9 CD. See Figure 1.
4. Close the Startup Disk control panel.
5. Restart the computer with the Mac OS 9 CD, and proceed with the Mac OS 9 installation.

Since the Mac OS 9 CD has been selected as the startup volume the "c" key should not be pressed at startup. After installing Mac OS 9 you should open the Startup Disk control panel and select the internal hard disk as the startup volume.

Figure 1 Startup Disk control panel showing Mac OS 9 CD selected as startup disk.

Mac OS 9: Includes Battery Updater Functionality

Do I need to install the Battery Reset 2.0 software on my iBook or PowerBook G3 Series computer if I am running Mac OS 9?
This article has been archived and is no longer updated by Apple.
Although you will not see the Battery Updater file in the Extensions folder, Mac OS 9 includes the functionality of the Battery Updater 1.0 extension installed by the Battery Reset 2.0 software. For iBook owners with Mac OS 9 installed this means there is no reason to install the Battery Reset 2.0 software. The same holds true for PowerBook (FireWire) owners.

PowerBook G3 Series owners with Mac OS 9 installed may still want to install the Battery Reset 2.0 software to get the Battery Reset application. This application will reset a battery which may have been damaged in a certain way. The Battery Reset application is not needed, and will not work on an iBook or PowerBook (FireWire) computer.

Mac OS 9: HP DeskWriter 600 Series Requires Updated Driver

Can I use my HP DeskWriter 600 series printer with Mac OS 9?
This article has been archived and is no longer updated by Apple.
Hewlett-Packard DeskWriter 600 Series printers (and certain HP DeskJet printers) require an updated printer driver for use with Mac OS 9.

Hewlett-Packard has published this statement regarding the update:

DeskJet and DeskWriter Driver Patch Application for v.9.4.0 and v.9.4.1

You should apply this driver updater if you are using Mac OS 9 with one of the printers listed below. Do not apply if your current operating system is not Mac OS 9. This program is designed to perform updates to versions 9.4.0 and 9.4.1 of the DeskJet printer driver for Mac OS.

When it is run, this program will perform the following driver updates:

1. *Serial drivers for DeskWriter 600, 660, 680 and 690 series; v.9.4.1 updated to v.9.4.3.*
2. *AppleTalk (AT) drivers for DeskWriter 600, 660, 680 and 690 series; v.9.4.1 updated to v.9.4.3*
3. *Serial drivers for DeskJet 850, 855 and 870 series; v.9.4.0 updated to v.9.4.2*
4. *AppleTalk (AT) drivers for DeskJet 850, 855 and 870 series; v.9.4.0 updated to v.9.4.2*

This article provides information about a non-Apple product. Apple, Inc. is not responsible for its content. Please contact the vendor for additional information.

Macintosh Manager 1.2: Read Me

This article comprises the Read Me for Macintosh Manager version 1.2. This software was released by Apple on 06 January 2000.
This article has been archived and is no longer updated by Apple.
Note: Any reference to "Mac OS X Server" in this article pertains to Mac OS X Server versions 1.2.x, which were released prior to May 2001.

About Macintosh Manager 1.2

Macintosh Manager 1.2 is intended to be used with client computers that have Mac OS 8.1 or later (including Mac OS 9) installed. Macintosh Manager 1.2 does not include the server process necessary to run Macintosh Manager. You should use the Macintosh Management Server 1.2 software that came with Macintosh Manager 1.1 for Mac OS X Server 1.2, or the Macintosh Management Server 1.2 software for an AppleShare IP 6.3 server, available on the Apple Software Updates web site (http://www.apple.com/swupdates).

IMPORTANT If you are using Macintosh Manager 1.1 (which is preinstalled on Mac OS 9 systems), it is recommended (though not necessary) that you update your client computers to version 1.2 to take advantage of bug fixes included in this version.

What's New in Macintosh Manager 1.2

- Support for Mac OS 8.1 or later systems, including new options in the administration program.
- Fixes for some known problems. For a list of corrected problems, see "Major Problems Fixed in Version 1.2," at the end of this document.

If you are using Mac OS 9, you will also notice these changes.

- *User preferences:* Mac OS 9 now manages user preferences and stores them on the workgroup data volume, which, by default, is the Macintosh Manager server volume. Unlike previous versions of Macintosh Manager, Mac OS 9 can use the preferences for a user stored on the server without having to copy them to the client computer. Because preferences do not have to be copied between the server and the client workstation, users should be able to log in faster.
- *Desktop items:* Mac OS 9 saves the folder for desktop items only on the local volume and not on the server volume. Therefore, if users place items on the desktop, they must log in to the same computer to access those items. On netboot systems, instruct users not to place items on the desktop because all client image changes are erased any time the netboot server restarts.
- *Keychains:* Macintosh Manager creates a keychain for users when they log in the first time. When users log in using their Macintosh Manager password, the keychain unlocks. If a user or the administrator changes the user's password, Macintosh Manager does not update the keychain to the new password and the user's keychain may not unlock when logging in. To unlock the keychain and use its services, use the Keychain Access control panel.
- *Application preferences:* Because Mac OS 9 manages preferences, you can no longer add or remove specific preferences for applications. If an application does not save its preferences in the Preferences folder (in the System Folder), you may not be able to save individual preferences for each user. Contact the application developer to determine if an update is available.
- *User documents:* Macintosh Manager now saves user documents in a folder with the user's name in the Users folder on the workgroup data volume sharepoint.
- *Login dialog:* For security reasons, if you choose "Users choose their name from a list" in the Macintosh Manager administration program and "Users type their names" in the Multiple Users control panel, users must type their user name to log in.
- *Multiple Users control panel:* Macintosh Manager does not support some features in the Multiple Users control panel in Mac OS 9, including alternate passwords, user pictures, automatically detecting recently installed applications, and allowing users to let other users view their documents folders.

Installing Macintosh Manager 1.2

IMPORTANT You should use the Macintosh Manager administration program to set up your users and workgroups before installing the client software.

The Macintosh Manager software has three components:

- a server process, either Mac OS X or AppleShare IP 6.3
- an administration application installed on the administrator's workstation
- client software installed on each computer you want to manage with Macintosh Manager

The Macintosh Management Server process is *not* included in this update. The Macintosh Management Server 1.2 server process for use with a Mac OS X server is available with the Mac OS X Server 1.2 product. The Macintosh Management Server 1.2 server process for use with an AppleShare IP 6.3 server is available on the Apple Software Updates Web site: http://www.apple.com/swupdates.

In addition to the Macintosh Manager components, when you install the client software on pre-Mac OS 9 clients, a new shared library called NavSecurityLib is also installed. The library is only active on computers with Mac OS 8.5 to 8.6.

There are several ways of updating your client computers to use this new version of Macintosh Manager:

- Use the Installer to update each individual workstation.
- Use Network Assistant to copy the appropriate files to client workstations.
- If you already have Macintosh Manager 1.1 on client workstations, use the new auto-update feature that is now part of the client software. For instructions on using the auto-update feature, see "Using the Update Package," later in this document.

If you are updating a specific client workstation from Macintosh Manager 1.0 or 1.1 to version 1.2, you should run the Installer application on the client computer to update your software.

If you run the Installer on a Mac OS 9 system, you will also be given the option of installing the administration application on your workstation.

Turning On Macintosh Manager 1.2

On Mac OS 9 client computers, follow these steps to turn on Macintosh Manager 1.2:

1. Open the Multiple Users control panel.
2. Click On for the Multiple User Accounts option.
3. Click the Options button to open the Options window.
4. Click the Other tab.
5. Select the "Macintosh Manager account (on network)" radio button.
6. Click Save and then close the Multiple User control panel to save changes.
7. Restart or log out (Command-Q) from the Finder to enter the Macintosh Manager login screen.

Using Network Assistant to Turn On Macintosh Manager

If you have Network Assistant client software set up on your client computer, you can use the Network Assistant administration program to update a group of workstations quickly. To do so, follow these steps:

1. On one client computer, follow the steps described above to set up the client to select its accounts from Macintosh Manager. **IMPORTANT** Do not restart or log out yet.
2. Open the Network Assistant administration program and select the computers you want to update.
3. Open the Manage menu and choose Copy Items.
4. Type "Multi-User Prefs" in the text box and click Find. Select the file in the list and click Copy. The file is in the Preferences folder (in the System Folder) and contains the information that indicates where the client should find its accounts.
5. Open the Manage menu and choose Restart to restart the client computers.

On Mac OS 8.x client computers, you only need to restart your computers once the software has been installed. The Macintosh Manager 1.2 software will automatically scan for the Macintosh Manager server.

Using the Update Package

If you are using Macintosh Manager 1.1 on your client computers, you can use the auto-update package, instead of the Installer, to upgrade your clients to this version of Macintosh Manager. To do this, your client computers must be properly configured and running Macintosh Manager 1.1.

To use the auto-update package, do the following:

1. Open the Macintosh Manager 1.2 Installer disk image and locate the "MM Update Package" file, which should be inside the Update Package folder.
2. Copy the "MM Client Package" file to the top level of your Multi-User Items folder *on the server.* This folder should be located inside the Macintosh Manager share point on the server.

Client workstations periodically monitor the folder for the update package; if the folder is found, the client will update the software automatically when the client workstation is in the Login screen. After all your clients have updated, it is recommended that you remove the update package file to prevent your clients from unnecessarily accessing the server. Also, if you connect your client to a server unintentionally, and the server you connect to has an update package, your client software may change from the version that you are using. Thus, you should only connect to servers that you have direct responsibility for to ensure that your client software is not changed by an update package file set up by someone else.

System Requirements

Server
Mac OS X Server software or AppleShare IP 6.3 server software installed and configured

Macintosh Management Server 1.2 software installed

Administration Workstation
Mac OS 9
Networking (IP or AppleTalk) set up
800 x 600 minimum display resolution

Client Computer
Mac OS 8.1 or later (Earlier versions of the Mac OS are not supported.)
Networking (IP or AppleTalk) set up

Changes to Preference Handling on Mac OS 8.x Client Computers

Unlike Mac OS 9 client computers (which do not need to copy preference files from the server), Mac OS 8.x clients have the option of copying user preferences from the server. This option must be enabled in the administration program; this allows the administrator to prevent preferences from being copied if the time required to do so becomes excessive and causes delays in user login and logout times. The instructions for turning on preference handling are described in the next section.

User Documents Folder Privileges

In previous versions of Macintosh Manager, if you disabled a user's access to his or her user documents location (via the Privileges panel of the Workgroups panel), and the user's documents were stored on a different volume from the Macintosh Manager volume, the user could not access the documents volume. In Macintosh Manager 1.2, since preference information is now stored in that location, the user will always have some access to the documents volume, though the user's actual documents folder may still be protected via the privileges set up in the administration program.

Appearance Preservation

Appearance-related preferences (desktop pattern, etc.) will only be preserved for client computers running Mac OS 8.5 or later.

Turning on Preference Handling for Mac OS 8.x Client Computers

To enable the option to preserve user preference files, follow these steps:

1. Open the Macintosh Manager administration program.
2. Click the Workgroups tab, then click the Options panel.
3. Enable preference handling for each workgroup for which you want Macintosh Manager to preserve Mac OS 8.x users' preference files.
4. Click the Global tab, then click the Security panel.
5. Select which files are copied when users log in to a workgroup. You can choose to copy the entire Preferences folder, or just a preset list of Internet-related preferences.

Note that, unlike with Macintosh Manager 1.0, you can no longer copy specific items anymore, and some system preferences will never be copied when users log in or out. Also, only items that are normally stored in the Preferences folder will be moved.

Mac OS 8.x clients will copy preferences to and from the same location on the server that Mac Os 9 clients use to store preferences. Users will have the same preferences whether they log on from a Mac OS 9 client or from a Mac OS 8.x client.

IP Access to Workgroup Volumes

In order to better allow access to volumes using IP, instead of AppleTalk, a few minor changes have been made to the Macintosh Manager administration program's workgroup options.

Workgroups Tab; Options Panel

The pop-up menu that allows the administrator to select a group documents volume contains an option for "Other." Selecting this option opens a window that lists the currently mounted volumes on your desktop. If you want to use an IP-only volume, you should click the Chooser button and use the Chooser's Server IP Address option to mount the volume using IP. Then, return to the administration program, which will now show the newly mounted volume in the list. Select the volume in the list and click OK. The volume should show up in the pop-up menu along with its IP information.

Workgroups Tab; Volumes Panel

The list of available volumes has been changed to show volumes mounted on your desktop. To have your workgroup members automatically mount certain volumes using IP, you should click the Chooser button and mount the volume with the Chooser's Server IP Address option. After

you return to this window, you can select and add the volume to your workgroup's list. The accompanying IP information should be displayed in the list to indicate that an IP connection will be attempted.

Login Performance

When a workstation user logs in, there are a number of places that can cause slowdowns for the login process. This section will help you better understand where these places are, and in some instances, how to avoid them.

"Finding User Documents"

If your workgroup does not store its documents on the Macintosh Management Server, login will need to locate the volume. If you think you are experiencing overall slowdown on the network, you may want the workgroup's Group Documents server to remain on the "Designated Macintosh Management Server." If you are using DHCP, you may want to try using static IP numbers to see if performance increases.

"Updating items: Locating items on disk"

Changing a workgroup's items (approved applications) can affect login performance the next time the user logs in. Any changes to the list, regardless of whether or not you are adding or removing items, will cause the workstation to re-find the items the next time the user logs in. Usually, only the first user of the changed workgroup to log into that workstation will notice this particular slowdown. Also, you may wish to reduce the number of approved items to increase login performance.

"Setting up Apple Menu Items aliases"

When a user logs in on a Mac OS 9 workstation, aliases to their Apple Menu Items are created in the user's own directory in order to save disk space. The time it takes to create these items can be long, so you should not make unnecessary changes to a workgroup's Apple Menu privileges, especially the "(Show Other Items)" option.

If a user logs into different workstations, it is possible that these aliases will be created every time the user moves to a different machine. To minimize login time, users should attempt to use the same workstation at every login.

Finally, if you continue to have problems with this area, you can bypass this function by putting a copy of the Calculator file inside the user's Apple Menu Items folder. This must not be an alias; it must be a real Calculator file. When login sees this file, it triggers itself to not create aliases to the other Apple Menu Items files and can speed up login during this phase. You can also manually put other menu items in here, but you should be aware that any aliases to a local workstation object may not resolve properly. And, aliases to the Chooser, control panels and other system folders will always be created during login.

Other Changes

- When using the Panels environment, after opening some older control panels, you will no longer be allowed to open additional control panels until you close the current control panel.
- On Mac OS 9 clients, the individual desktop picture aliases stored in the user's own Desktop Pictures folder are replaced by a single alias to the system Desktop Pictures folder.
- Locked items in the Apple Menu Items folder will not be deleted when the user logs into a different computer from the one he or she was previously using.
- Global and workgroup administrators will no longer be forced to enter an administrator password when ejecting volumes or printing.
- On Mac OS 8.x client computers, file sharing is not allowed in any environment, including System Access. If an attempt is made to start file sharing, it will be ignored and in some cases an error message will be displayed.
- When a user opens or saves a file, Macintosh Manager 1.2 will no longer show its own view of the disk hierarchy. Instead, the location shown in the window will be the actual location on the disk, because security on a folder is now enforced strictly by the file system. Depending on the version that you were previously running, this might mean that you will no longer see a Places button, or that when users move up the folder hierarchy from their own documents folder, the users will move to the top-level Documents folder instead of the desktop or places location.
- If a user belongs to more than one workgroup, only the workgroups that have the same Group Documents volume will show up in the menu that allows the user to switch workgroups without logging out.

Major Problems Fixed in Version 1.2

The following problems have been corrected in this version of Macintosh Manager:

- If a user belonged to only one workgroup, sometimes an alert message appeared requiring the user to shut down.
- Desktop printers were not remembered properly.
- Users could sometimes unmount volumes without an administrator password (if this option was activated) in restricted environments.
- In some cases, an inserted CD did not appear even though the user had access to it.
- Users could not directly copy files to a shared folder even when read and write access was allowed.
- Panels users were sometimes unable to log in if their Documents folder access was disabled.

- Even if the option to show a volume as a tab was disabled, sometimes volumes appeared.
- The workgroup menu always said "System Access" when a user logged into a workgroup that was accessed using the option to "always use selected workgroup" in the workgroup selection screen.
- Users could change their passwords when offline access was invoked; they can no longer do so.
- If you changed the administrator password in the login screen, the change did not take effect with other clients until you ran the administration program.
- Some problems with using control panels in the Panels environment have been corrected.
- A user could use the mini-debugger to quit the login process; this should no longer be possible.
- Disk quotas did not work properly for some users.
- An error message sometimes appeared when renaming removable media in the Panels environment.
- On some sleep-enabled computers, the Sleep button did not appear when you pressed the Power key at login time.
- If you did not have any desktop printers set up for a Finder workgroup, but used the "Remember last used printer" option, the printer wouldn't be remembered.
- If a user logged out during an idle lock or logoff session and the application that the user had open required the user to save changes to their document, if the user clicked Cancel, the Save dialog box did not reappear for 10 seconds. Now, for better security, users who click Cancel should immediately be presented with the same Save dialog box. This helps prevent other users from damaging the account of the user who is logging out.

Known Issue in Version 1.2

You can use the "Shut down the computer" command in Macintosh Manager to shut down workstations that provide a shutdown option in their Energy Saver settings. Workstations that provide a sleep option (rather than shutdown) in their Energy Saver settings will be put to sleep instead of shut down when you use the Macintosh Manager shutdown command.

Mac OS 9.0: Software Update 1.1.1 - Read Me

This article comprises the Read Me for Software Update version 1.1.1. This software was released by Apple on 01 February 2000 and is available for download from the Apple Software Updates Web site at http://www.apple.com/swupdates.

This article has been archived and is no longer updated by Apple.

About Software Update 1.1.1

What's new in Software Update 1.1.1

Software Update 1.1.1 provides enhancements which will make it faster to deliver Apple software updates over the Internet. Software Update1.1.1 includes Disk image support and MacBinary and AppleSingle support which allows files to be encoded more efficiently.

This update includes the following components: the Software Update Engine application, the Software Update Scheduler extension, and the Software Update Control Panel.

Power Mac G4: Red Light on Logic Board

A Power Mac G4 computer's logic board may have a red light that you can see through the case, even if the side door is closed.
This article has been archived and is no longer updated by Apple.
A Power Mac G4 computer's logic board may have a red light, which may occasionally be visible through the case when the side door is closed. The characters "DS5" are printed on the logic board next to the light.

The light may be lit whenever the computer is turned on, regardless of whether you're using it or have put it to sleep. When you open the computer for service or an upgrade, check to see if the light is lit. If so, be sure to shut down the computer before continuing. Choose Apple menu > Shut Down (Mac OS X) or Special > Shut Down (Mac OS 9).

QuickTime 4.1: What‘s New?

This article describes the new features in QuickTime 4.1.
This article has been archived and is no longer updated by Apple.

Supports Apple PowerPC-based computers only.
QuickTime 4.1 will not install on Macintosh computers with a 680x0 processor. It is also only supported on Apple computers with a PowerPC processor.

Supports Intel Pentium-class computers only.
QuickTime 4.1 is not supported on computers with processors older than the Intel Pentium, such as the 80486. Pentium-class computers include corresponding non-Pentium brand processors such as the Intel Celeron and the AMD Athlon.

Plays MP3 VBR files.
You can now play MP3 media (audio) using variable bit rate compression.

Access to controlled sites.
You can tune in to more sites now that QuickTime supports logging on to sites with controlled access, such as pay-per-view sites. All you need to do is set up an account with the content provider, then enter your user name and password when you want to access that site.

Improved navigation through firewalls.
Your QuickTime Settings control panel has additional options for Streaming Proxy settings and a new Streaming Transport panel. Click the Auto Configure button in the Streaming Transport panel to improve streaming performance.

Browser Plug-In settings via control panel.
You can configure the browser QuickTime Plug-in option in the QuickTime Settings control panel. Previously, this had to be configured via a pop-up menu in an active QuickTime movie.

Supports Mac OS 7.5.5 or later (Mac OS version).
System 7.5.5 is the base Mac OS version supported on Apple PowerPC-based computers.

Control Strip (Mac OS version).
You can use the QuickTime control strip to launch QuickTime Player, PictureViewer, and QuickTime control panel to adjust Settings, as well as select a streaming Channel from a channel list to view with QuickTime Player.

AppleScript support (Mac OS version).
You can use AppleScript and the QuickTime scripting dictionary to automate tasks.
Published Date: Feb 20, 2012

QuickTime 4.1: System Requirements

This article outlines the system requirements for QuickTime 4.1.
This article has been archived and is no longer updated by Apple.
QuickTime 4.1 runs on Macintosh and Windows computers and requires the following (by platform):

Macintosh

- Apple computer with a PowerPC processor
- System 7.5.5 or later

Windows-based PC

- Windows-based computer with a Pentium-class processor
- Windows 95, 98, NT 4, or Windows 2000

Note: Although QuickTime 4.1 was not extensively tested with Windows 2000, no significant issues have been identified. A forthcoming update to QuickTime will be fully tested with Windows 2000.
Published Date: Feb 20, 2012

QuickTime: How to receive a streaming movie behind a firewall

Learn how to set up QuickTime clients behind a firewall to receive a streaming movie.
This article has been archived and is no longer updated by Apple.

About Streamed movies behind a firewall

QuickTime uses the Real Time Streaming Protocol (RTSP) to send video and audio over the Internet. Some institutions may have a firewall that prevents movies streamed by RTSP to be viewed by clients behind a firewall. To overcome this, QuickTime can stream video and/or audio using the Hypertext Transport Protocol (HTTP)--the protocol used by the Web. **Note:** Playback performance may lag when using HTTP streaming instead of RTSP. In addition, the streaming server must also have a streaming over HTTP feature.

How to set up QuickTime

Mac OS X

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **QuickTime**. The QuickTime preferences pane appears
3. Click on the Connection tab.
4. Choose your Internet connection from the Connection Speed pop-up menu.
5. Click Transport Setup. The Streaming Transport Setup window appears.
6. Click Auto Configure.

If QuickTime is able to configure itself for use behind a firewall, you should be able to watch a streamed movie.

Windows

1. Click Start and point to Control Panels.
2. Open the QuickTime control panel.
3. From the pop-up menu, choose Streaming Transport.
4. Click Automatically determine the best protocol and port ID.

If QuickTime is able to configure itself for use behind a firewall, you should be able to watch a streamed movie.

Mac OS 7.5 through Mac OS 9

1. Open the QuickTime Settings control panel.
2. Choose Streaming Transport from the pop-up menu.
3. Click Auto Configure.

If QuickTime is able to configure itself for use behind a firewall, you should be able to watch a streamed movie. If you are still unable to view streaming movies, contact your institution's network administrator.

AppleWorks 6: CarbonLib Required

CarbonLib is required to run AppleWorks 6.
This article has been archived and is no longer updated by Apple.

Symptom

When you open AppleWorks 6 an alert box with the following error message appears:

> "The application 'AppleWorks 6' could not be opened because 'CarbonLib' could not be found"

Solution

Install CarbonLib 1.0.2 or higher.

You can use the AppleWorks First Run program in the AppleWorks Essentials folder to install CarbonLib 1.0.2 and other system extensions required by AppleWorks. Later versions of CarbonLib are available.

- If your computer has Mac OS 8.1 through Mac OS 8.6.1, you can download a later version of CarbonLib from http://www.apple.com/swupdates/ .
- If your computer has Mac OS 9 use the Software Update control panel to update to a later version.

What is CarbonLib?
"Carbon" is a set of programming interfaces that developers use to create software for Mac OS 9 and Mac OS X. CarbonLib is a system extension that allows a Carbon-based application to be used with Mac OS 8.1 or later.

For more information on Carbon, see the Apple Developer Web site:
http://developer.apple.com/techpubs/carbon/carbon.html

AppleWorks 6: How to Make a Template

You can create templates that you can access from the Templates panel of the Starting Points window.
This article has been archived and is no longer updated by Apple.
To create a template:

1. Prepare a document that contains all the text, graphics, and formatting options you want to be a standard part of the template.
2. Choose Save As from the File menu.
3. Type a name for the template.
4. Click the Template button.
5. Use the controls in the Save dialog box to navigate to the Templates folder (located in the Starting Points folder, which is in the AppleWorks folder). If you don't want your template to appear in the Starting Points window, save it in another location.
6. Click Save.

Published Date: Feb 20, 2012

AppleWorks 6: Converting an AppleWorks 5 User Dictionary

The dictionary format used by AppleWorks 6 is different from AppleWorks 5. To use your user dictionary in AppleWorks 6, you must first convert it to AppleWorks 6 format.

This article has been archived and is no longer updated by Apple.

Exporting user dictionary terms from AppleWorks 5

To export words from the AppleWorks 5 user dictionary:

1. Choose Writing Tools from the Edit menu, then choose Edit User Dictionary from the submenu.
2. Click the triangle next to Text File in the lower-right corner of the dialog box.
3. Click Export.
4. Select where to save the file and Click Save.
5. Click OK when the file has been exported.
6. Click OK to dismiss the dialog.

Importing user dictionary terms into AppleWorks 6

To import words from a text file into the current user dictionary:

1. Choose Writing Tools from the Edit menu, then choose Edit User Dictionary from the submenu.
2. Click the triangle next to Text File in the lower-right corner of the dialog box.
3. Click Import.
4. Select the file you want to import, then click Open.

AppleWorks 6: What‘s New - Presentations

This article describes some of the new features of AppleWorks 6.
This article has been archived and is no longer updated by Apple.
AppleWorks 6 contains a new environment designed for presentation development. As you design and organize your presentations, you can take advantage of the following features:

- Choose from a variety of slide templates or design your own presentation from scratch.
- Design a common slide background.
- Design and name multiple slide masters.
- Reorder and name individual slides using the thumbnail viewer.
- Draft speaker's notes using the Notes View feature.
- Group related slides together for reordering as a unit.

When you're ready to give your presentation, you can use the following playback features:

- Choose visual effects to use as transitions between slides.
- Use the Auto Advance or Loop feature to run a presentation automatically.
- Attach multimedia files to add music, movies, or voice annotation to your presentation.
- Hide individual slides so that you can use the same presentation for different audiences.

AppleWorks 6: What‘s New - Tables

This article describes some of the new features of AppleWorks 6.
This article has been archived and is no longer updated by Apple.
AppleWorks 6 has greatly improved capabilities for creating and modifying tables. You no longer need to use a spreadsheet frame to organize text in rows and columns.

Easy table creation:
With the new table frame tool, you simply draw a frame where you want to add a table and specify the number of rows and columns.

Flexible table structure:
You can easily add and delete table cells individually, in ranges, or in entire rows and columns. Cells can span multiple rows or columns. When you type in a cell, it can expand downward to accommodate the text.

Customizable table appearance:
You can customize the appearance of table elements such as lines and line segments, cells, rows, and columns. Within each table cell you can apply the full range of text-formatting options, including word-processing options such as outlines.

Embedded content:
You can embed pictures, sounds, or movies in table cells. You can also embed other types of frames (spreadsheet, painting, word-processing, and even other table frames) within cells. You can even link a cell's text or graphics to a Web site.

Easy export to the Web:
HTML export capability has been enhanced to allow table export. Even complex nested tables with graphics are converted to HTML accurately.

AppleWorks 6: How to Set up Default Templates for Specific Document Types

If you typically use particular content and formatting options for a particular document type, you can set up a default template for that document type. Default templates are also known as Options documents.
This article has been archived and is no longer updated by Apple.

Creating a default template

To create a default template document for a specific document type:

1. Prepare a document that contains all the text, graphics, and formatting options you want to be a standard part of the template.
2. Choose Save As from the File menu.
3. Enter the appropriate name for the document:
   - For word-processing documents, type AppleWorks WP Options.
   - For spreadsheet documents, type AppleWorks SS Options.
   - For presentation documents, type AppleWorks PR Options.
   - For database documents, type AppleWorks DB Options.
   - For drawing documents, type AppleWorks DR Options.
   - For painting documents, type AppleWorks PT Options.
4. Click the Template button.
5. Use the controls in the Save dialog box to navigate to the Templates folder (located in the Starting Points folder, which is in the AppleWorks folder).
6. Click Save.

The next time you create a new document of that type, your new default template opens. You can still open a document with standard formatting options (instead of the options you created in your default template). To do so, click the Standard button for the desired document type (for example, Standard WP) on the Basic panel of the Starting Points window.

Some versions of AppleWorks 6 automatically append the template filename with ".cws". If the default template does not open as expected, locate the file in the Templates folder using the Finder, and delete the .cws filename extension if present.

Important: Your default template is saved in the AppleWorks Templates folder. If you move the template to another folder, it will no longer function as the default template.

Deactivating a default template

If you no longer want to use a default template document for a document type, you can deactivate it.

To deactivate a default template:

1. Quit AppleWorks.
2. Open the Templates folder (in the Starting Points folder).
3. Delete, rename, or move the default template document for the document type. (See above for the names of default template documents for each document type.)

Published Date: Feb 20, 2012

AppleWorks 6: What‘s New - Internet Content

This article describes some of the new features of AppleWorks 6.
This article has been archived and is no longer updated by Apple.
Using the new Internet content capability of AppleWorks 6, you can access an abundance of material on the AppleWorks Web site (or anywhere on the Internet) without having to launch a Web browser or decompress files.

In the Clippings and Starting Points windows you can access:

- thousands of Web-based clip art images using the powerful search function in the Clippings window
- hundreds of additional Web-based templates
- regular newsletters offering AppleWorks tips, projects, special offers, and news

If you have your own Web site, you can also use the Internet content feature to post AppleWorks templates, clip art, and documents that you've created and want to share with friends and colleagues.
Published Date: Feb 20, 2012

AppleWorks 6: What‘s New - Updated User Interface

This article describes some of the new features of AppleWorks 6.
This article has been archived and is no longer updated by Apple.
If you have used an earlier version of AppleWorks or ClarisWorks, you'll notice that AppleWorks 6 has a new look.

Starting Points:
The Starting Points window, which replaces the New Document dialog box, lets you quickly create and open documents including recently opened files, templates, and Assistants, and access Internet content. You can add your own panels to Starting Points to provide easy access to your frequently used files.

Clippings:
The Clippings window, which replaces the libraries in earlier versions of AppleWorks, gives you ready access to the variety of clip art included with AppleWorks 6 as well as Internet clippings. A powerful search feature helps you find the items you want easily.

Accents:
The Accents window combines the tools for setting colors, patterns, wallpaper (textures), gradients, and line styles into a single floating window with palettes for adding or changing the fill, pen, and text attributes.

Button Bar:
In addition to its new appearance, the Button Bar can now be scrolled. It has been streamlined to include a single set of the most commonly used buttons for each of the six AppleWorks environments. You can add, delete, or customize buttons if the default buttons don't meet your needs.

Tools:
Tools now appear in a floating window, giving you more flexibility in managing the "real estate" in the document window. The Tools window allows quick access to frame creation, drawing, and painting tools.

AppleWorks 6: What‘s New - Productivity Enhancements

This article describes some of the new features of AppleWorks 6.
This article has been archived and is no longer updated by Apple.

Auto-Save and auto-recover

When the new Auto-Save preference is turned on, you can create documents without worrying about losing data. AppleWorks automatically saves your documents as often as you like: every few seconds, every 12 hours, or anything in between.

Further, if your computer or AppleWorks unexpectedly quits, AppleWorks automatically reopens the files you were working on.

Improved mail merge

An enhanced mail merge feature makes it easy to merge data from a database document into a form letter or other word-processing or spreadsheet document. With AppleWorks 6, you can merge to a single file, multiple files, or directly to a printer.

Enhanced spreadsheet functionality

- You can now insert references to external spreadsheet documents or frames.
- Using the new Paste Function dialog box, you can choose from over 100 built-in functions for spreadsheet and database calculations. The dialog box now provides both the function name and a simple description.
- New cursor key commands make it easy to navigate around large spreadsheets without using the mouse.
- AppleWorks 6 automatically adds an ending parenthesis if it is accidentally omitted from a spreadsheet formula.

Published Date: Feb 20, 2012

About the button bar icons in AppleWorks 6

Learn about the icons in the various AppleWorks 6 button bars.
This article has been archived and is no longer updated by Apple.
The icons are read from left to right and include comments when necessary.

Common Tools

- Bold
- Italic
- Underline
- Anchor (makes the select text or object an anchor)
- Document link (creates a link to another document)
- URL link (creates a link to a web page)
- Links On/Off (turns actives links on or off so you can edit text within a link)
- Print
- Word Processor (open a new word processor file)
- Drawing (open a new drawing file)
- Painting (open a new painting file)
- Spreadsheet (open a new spreadsheet file)
- Database (open a new database file
- Presentation (open a new presentation file)

Word Processor

- Promote (moves the selected topic one level to the left)
- Demote (moves the selected topic one level to the right)
- Check Spelling
- Show/Hide Invisibles (shows or hides formatting characters such as spaces or tabs
- Sort Paragraphs (sorts selected paragraphs in order specified)

Spread Sheet

- Outline Border (outlines the selected range within a border)
- Left Border
- Top Border
- Right Border
- Autosize Column (Makes the selected columns as wide as the widest cell in the range)
- Autosize Row (Makes the selected rows as tall as the tallest cell in the range)
- AutoSum (Calculates the total of the data in the selected range and displays the results in the next empty cell)
- Make Chart (Creates a chart from the selected data)

Database

- Sort+ (sorts the found set of records in ascending order (A to Z))
- Sort - (sorts the found set of records in descending order (Z to A))
- New Record
- Delete Record
- Show All Records
- Browse Mode (switches the current database to browse mode)
- List Mode (switches the current database to list mode)
- Create Labels (Lets you create a new label layout)

Drawing

- Text Wrap (wraps text tightly around the selected object)
- Rotate 90° (rotates the selected object 90° counterclockwise)
- Align (aligns the selected objects)

Painting

- Lighter (adds a white tint to the selected object)
- Darker (adds a black tint to the selected object)
- Tints (tints the selected image with the current fill color)
- Blend (softens an image by adding intermediate colors)
- Invert (reverses the colors of the selected image)
- Pickup (picks up the selected image's attributes)

Mac OS 9: Keychain and Chooser Interaction

I am using the Chooser and selecting Add to Keychain, but it appears that my name and password are not being saved correctly. If I open the Chooser to log on to the server again, I have to re-enter my name and password as I did on the first log in, even though I selected Add to Keychain in the Chooser window.
This article has been archived and is no longer updated by Apple.
The Chooser is working correctly It should ask you for a name and password when you log on to a file server. The Add to Keychain feature is simply a convenience that allows you to add your name and password, plus the server information to your Keychain.

If you want to connect to a file server volume using the Keychain, and without typing your name and password, do this:

- Use the Network Browser application instead of the Chooser.

or

- Make an alias of the server volume once you have connected to the server using the Chooser. Use the alias to connect to the server in the future.

To make sure your Keychain is working correctly, open the Keychain Access control panel and open the entry for the server. You should see the server/volume name. You can check your password for the server by opening the associated Keychain entry for the volume by double clicking on the volume name. You will need to enter your Keychain password to view these settings.

Note: Server administrators have the option of not allowing you to use the Keychain to automatically log on to a server volume.

Apple DVD Player: How to Improve Audio Synchronization

This article explains how to improve audio synchronization when playing movies from DVD-Video discs.
This article has been archived and is no longer updated by Apple.

Symptom

When playing a movie from a DVD-Video disc the sound is not synchronized with the picture.

Affected Products

- Power Mac G4
- iMac (Slot loading)
- PowerBook (FireWire)
- iBook

Solution

1. Install these updates:
   - Mac OS 9 Update (9.0.4)
   - Apple DVD Player 2.2 or later
   - QuickTime 4.1.1 or later
2. Turn off Virtual Memory in the Memory control panel
3. Turn off AppleTalk in the AppleTalk control panel by clicking the Options button, selecting Inactive, and clicking OK
4. Make sure there are no background tasks, like copying files in the Finder, that could make the computer busy

You can use the Software Update control panel to install Mac OS 9 Update and Apple DVD Player 2.2. The current version of Apple DVD Player is 2.7. Each version can also be download from Apple Software Updates at http://www.apple.com/swupdates/ . Use the QuickTime Updater application in the QuickTime folder to update to QuickTime 4.1.1 or later of visit http://www.apple.com/quicktime/ to download the latest version.

Important: You must install Mac OS 9 Update before installing Apple DVD Player 2.2.

Specific movies on DVD-Video discs may have their own audio synchronization issues that are unrelated to Apple DVD Player. Audio synchronization issues with these discs could happen on any kind of DVD player.

For additional information on improving movie playback from DVD-Video discs, see article 58383: "**Apple DVD Player: Troubleshooting Video Issues.**"

Power Mac G4 Cube: How to Connect a Projector or Monitor

This article explains how to connect a projector or monitor with a VGA connector to a Power Mac G4 Cube computer.
This article has been archived and is no longer updated by Apple.
If your projector or monitor has a VGA connector, connect the VGA-to-VGA adapter that came with your computer to the VGA port and then connect your monitor cable to the adapter.

A. VGA monitor port on a Power Mac G4 Cube computer

Figure 1 Connecting the VGA-to-VGA adapter

To connect a projector or monitor to the VGA-to-VGA adapter:

1. Plug the VGA adapter into the VGA monitor port and tighten the thumbscrews.
2. Plug the project or monitor cable into this end of the adapter and tighten the thumbscrews.

Apple DVD Video Player: Error -9845 Disc Could Not Be Authenticated

The Apple DVD Player displays this error: "-9845 Disc could not be authenticated."
This article has been archived and is no longer updated by Apple.

Symptom

After the FBI warning and studio logos appear, the Apple DVD Player application displays an error (-9845) that the disc could not be authenticated.

Products affected

- Apple DVD Player 1.0
- Power Macintosh G3
- Power Macintosh G3 (Blue and White)
- Power Mac G4 (PCI Graphics)
- PowerBook G3 Series
- PowerBook G3 Series (Bronze keyboard)

Solution

Download and install Apple DVD Player Software 1.1 or later from Apple Software Updates at http://www.apple.com/swupdates/.

Mac OS 9: About the Mac OS 9 Utilities Read Me

The contents of this article are from a Read Me file included with Mac OS 9.
This article has been archived and is no longer updated by Apple.

About the Mac OS 9 Utilities

This document contains information about the utilities provided with Mac OS 9.

5xxx/6xxx Tester
This program tests Performa and Power Macintosh 5200, 5300, 6200, and 6300 computers for a possible hardware problem. If you have a Performa or Power Macintosh 5200, 5300, 6200, or 6300 series computer, you should use the tester before installing Mac OS 9. See the document inside the Tester folder for instructions on using the tester.

IMPORTANT The Power Macintosh or Performa 6320, 6360, and 5260 computers do not have this hardware problem. If you have a Power Macintosh or Performa 6320, 6360, or 5260 computer you do not need to use the tester program.

AppleShare software
If you have AppleShare software earlier than version 3.6.4, you should upgrade to version 3.6.5 or later before installing Mac OS 9 over a network. See the document inside the AppleShare folder for instructions. If your computer already has Mac OS 8 or later, you do not need to update the AppleShare software before installing Mac OS 9.

Drive Setup
Use the Drive Setup program provided with Mac OS 9 to update your disk driver or to reinitialize a disk. When you do initialize a disk all the contents of your disk are erased.

NOTE Earlier versions of Drive Setup can reintroduce problems resolved with this version of Drive Setup. You should throw away any earlier versions you have on your computer.

To update the disk driver with Drive Setup, follow these steps:

1. Open the Drive Setup program.
2. Click the disk whose driver you want to update.
3. Choose Update Driver from the Functions menu.

WARNING Turn off any disk protection software before using Drive Setup to update your disk driver.

IMPORTANT If the Update Driver command is dimmed, or if the disk name doesn't appear when you click the Drive button, either the disk is not supported by Drive Setup or it has been previously updated with a non-Apple utility.

- If the disk isn't supported, check the instructions that came with your computer or disk to see if the manufacturer includes or recommends a disk utility, then use that utility to update the driver. To ensure a successful update, obtain the latest version of the utility.
- If you've updated or formatted the disk with a non-Apple utility, you'll need to use that utility again to perform the update. To ensure a successful update, obtain the latest version of the utility.

NOTE After installing Mac OS 9, you cannot use the obsolete Apple HD SC Setup utility to initialize your hard disk. Use the current Drive Setup program supplied with Mac OS 9 instead.

Disk First Aid
Use the Disk First Aid program to diagnose and repair problems with your hard disk.

NOTE Old versions of some third-party disk repair utilities can cause problems when used on Mac OS Extended format disks. Disk First Aid may be able to correct these problems if they occur.

Disk Copy
Use the Disk Copy program to make exact copies of floppy disks from a disk image, mount disk images on your desktop, and various other functions related to disk images. Many Apple updates are provided in Disk Copy format. See the information in the Disk Copy folder for details.

SimpleText
SimpleText is a text editing program that can be used to create, edit, and view documents. It can also play QuickTime movies, display QuickDraw 3D objects, and speak text aloud. Many Read Me files, such as this one, are distributed in SimpleText format.
Published Date: Feb 20, 2012

Mac OS 9: Before You Install Read Me

The contents of this article are from a Read Me file included with Mac OS 9.
This article has been archived and is no longer updated by Apple.

Before You Install

This document tells you how to prepare for installing Mac OS 9 and gives compatibility information and basic troubleshooting. For additional information, see the Mac OS installation manual.

Before installing Mac OS 9, do these tasks:

- Turn off any security software that you may have installed on your computer.
- If you have a PowerBook, make sure that it is plugged into AC power and set not to go to sleep.
- Start up your computer using the Mac OS CD. See your installation manual for instructions.

Note: If you're installing the Mac OS from a network, you won't be able to start up using the CD. Before installing the Mac OS software, make sure the AppleShare extension (version 3.6.4 or later) is installed on your computer. For instructions, see the document in the AppleShare folder in the Utilities folder on the Mac OS CD.

If you can't start up from the Mac OS CD, or you're installing from a network, be sure to do the following additional tasks:

- Turn off File Sharing.
- Turn off any virus-protection software that you may have installed on your computer.
- Turn off all non-Apple extensions and control panels. Open the Extensions Manager control panel, then open the selected Set pop-up menu and choose "Mac OS All."
- Restart your computer.

Although compatibility problems are not expected, you can ensure a smooth upgrade by checking with the manufacturers of any non-Apple software you use to make sure it is compatible with Mac OS 9. If you do experience a problem, see the troubleshooting chapter in your installation manual for information on isolating compatibility problems.

Compatibility information

Apple language kits and Mac OS 9
Apple's retail language kit products have been incorporated into Mac OS 9. If you currently have one or more retail language kits installed, click the Customize button in the "Install Software" section of the Mac OS 9 installer, select "Language Kits", select "Customized Installation" from the popup menu, and then select any languages you already have installed, as well as any other languages you are interested in adding. Do not attempt to reinstall the retail language kit products on Mac OS 9.

Apple language kits and ATM Deluxe 4.5
ATM Deluxe 4.5 is not compatible with WorldScript I, the system extension used to support certain languages in Mac OS. Do not install ATM Deluxe 4.5 if you plan on using any of the following language kits: Arabic, Hebrew, Devanagari, Gurmukhi, Gujarati, Persian.

Installing Mac OS 9 on accelerated NuBus PowerPC computers
If you have a Power Macintosh 6100, 7100, 8100, or 9150 with a third-party accelerator card that increases the speed of your computer, the Installer may not install Mac OS 9. Contact the accelerator card's manufacturer for help.

If you are upgrading from Mac OS 8.1 or earlier

Installing Mac OS 9 on computers with Ultra Wide SCSI cards
Some older Ultra Wide SCSI cards require a firmware update before they will work with Mac OS 9. If the card's firmware is not compatible, your computer will crash during installation or when you start up from the CD. Before installing Mac OS 9, contact the manufacturer of your Ultra SCSI card to determine if a firmware update is necessary.

Third-party Finder and utility software
Some third-party programs that extend or add features to the Mac OS may be incompatible with Mac OS 9. Examples include programs that change the way menus work, change how files are stored, or alter the way you work with files in the Finder. Contact the software's manufacturer for information about using such programs with Mac OS 9. This is especially important if you're using a program that automatically alters the way files are stored (such as compressing them) because you might not be able to access those files until you obtain updated software for use with Mac OS 9.

Computers with DOS Compatibility cards
Apple DOS Compatibility cards do not work with Mac OS 9. After you install the software, you will no longer be able to use your DOS Compatibility Card to run DOS or Windows software.

Performa or Power Macintosh 5000 and 6000 series computers
Some Performa or Power Macintosh 5200 series, 5300 series, 6200 series, and 6300 series models cannot use Mac OS 9 until a hardware problem is fixed. The repairs are covered under the Apple repair extension program. To see if your computer has this hardware problem, use the 5xxx/6xxx Tester utility in the Utilities folder on the CD before installation.

IMPORTANT The Power Macintosh or Performa 5260, 6320, and 6360 do not have this hardware problem and do not need to use the tester program.

Troubleshooting suggestions

If you experience problems during installation, be sure to start up with the Mac OS CD. See your installation manual for instructions.

Updating your disk drivers
Some Apple-branded disks manufactured by third parties, including the Apple 365 MB external hard disk, are not supported by the Apple disk utilities. If your disk cannot be updated with the Apple utilities, you'll need to use a third-party disk utility to update the driver.

Repairing disks
If you see a message that your disk has problems and cannot be repaired, make sure file sharing is off, then try installing again. If that doesn't work, try using another disk-repair utility. If you don't have another utility, or if that utility also doesn't work, you may need to reinitialize the disk. Copy all your files to another disk first, as reinitializing erases the disk. For more information about reinitializing, see the manual that came with your computer.

Installing over a network
If you're installing over a network, or if you have a non-Apple CD-ROM drive and can't start up with the CD, turn off all extensions that weren't provided with your system software, then restart your computer.

Updating your firmware
If you receive a message during installation that your firmware is out of date, follow the instructions for updating your firmware in the CD Extras folder on your Mac OS CD.

Additional troubleshooting information is available in the installation manual.

Mac OS 9: Using the English Text-to-Speech Software Version 2.0 Read Me

The contents of this article are from a Read Me file included with Mac OS 9.
This article has been archived and is no longer updated by Apple.

Using the English Text-to-Speech Software Version 2.0

With the English text-to-speech software installed, many Macintosh programs including SimpleText can read English text and the contents of many alert dialog boxes out loud. SimpleText comes with this computer and is already installed on your hard disk. (You are probably reading this document using the SimpleText program.)

The instructions in this document tell you:

- how to install the software
- how to try out the software using SimpleText
- how to choose the default voice
- how to annotate text to improve intelligibility or add emotion
- some technical details, including what Text-to-Speech software is installed
- how to solve common problems

Installing the software

To install the English text-to-speech software, follow these steps.

1. Print these instructions before you start. You will not be able to view them on screen during the installation.
2. If you have been using an earlier version of text-to-speech software, see the note at the end of this section.
3. Double-click the Installer that's in the same folder as this document.
4. Click "Continue", then click "Install". The installation takes a few minutes.
5. When you see a message reporting that the installation was successful, click Restart.

After the computer restarts, you can start using the text-to-speech software.

Note for users of older English text-to-speech software. Installing English Text-to-Speech software version 2.0 may remove some or all of your older English Text-to-Speech voices. You can restore those voices by downloading an older version of the English Text-to-Speech software from http://www.apple.com/speech. However, only the voices that came with this version of the software have been tested and qualified by Apple on this Mac OS release. MacinTalk 2 and its associated voices (Ben, Boris, Brenda, Mariel, Marvin, Mr Hughes, Otis, Robovox, Votron, and Xero) are no longer supported. For a corresponding but more intelligible sound, we recommend trying Trinoids or Zarvox.

Trying out the Text-to-Speech software.

Follow these steps to try out text-to-speech software:

1. Open any SimpleText document. (This document will work well.)
2. Click anywhere in the text to make sure nothing is selected.
3. Choose "Speak All" from the Sound menu. (If you cannot hear anything, you may have the sound turned all the way off. Check in the Sound control panel.)
4. If you want the computer to stop reading, choose Stop Speaking from the Sound menu.

You can also try the following:

- To read a portion of the file, select the words you want to read, then choose Speak Selection from the Sound menu.
- To have the computer speak in a different voice, select a voice from the Voices sub-menu in the Sound menu, then choose the Speak All or Speak Selection command from the Sound menu.
- To use the text-to-speech features of other programs, see the instructions that came with those programs.

Choosing the default voice.

You can use the Speech control panel to use your favorite voice as the default voice for all your programs. To set the default voice, follow these

steps.

1. Open the Apple menu and choose Control Panels.
2. Open the Speech control panel by double-clicking its icon in the Control Panels window.
3. Open the Options pop-up menu at the top of the Speech control panel and choose Voice.
4. To change the default voice, choose the voice you want from the Voice pop-up menu. To hear what the voice you chose sounds like, click the speaker button.
5. To change the rate at which the default voice speaks, move the Rate slider.
6. Close the control panel.

Memory Constraints

If there is not enough memory available to hold a voice, then this software will not speak. The voices with "high quality" in their names have the most natural and intelligible sound, but take up the most memory. To see the memory requirements of the voices, view their sizes in the Voices folder, which is in the Extensions folder. To see how much memory you have available, click the desktop and then select "About This Computer" in the Apple menu.

Turning Talking Alerts on or off.

You can use the Speech control panel to turn Talking Alerts on or off. When this feature is on, your computer will read aloud the contents of alerts. (An alert appears, for example, when your printer runs out of paper.) To turn on the Talking Alerts feature, follow these steps.

1. Open the Apple menu and choose Control Panels.
2. Open the Speech control panel by double-clicking its icon in the Control Panels window.
3. Open the Options pop-up menu at the top of the Speech control panel and choose Talking Alerts.
4. To have your Macintosh speak a phrase like "Alert!" or "Hey!" when an alert appears, click the "Speak the phrase" check box to select it, and choose the phrase you want to be spoken from the adjacent popup menu.
5. To have your Macintosh speak the content of an alert when one appears, click the "Speak the alert text" check box to select it.
6. To adjust how long your Macintosh waits after an alert appears before speaking the alert text, adjust the slider beneath the "Speak the alert text" check box.
7. To test how Talking Alerts will behave with your chosen settings, click the speaker icon to the right of the slider.

To interrupt and cancel the computer's speaking, click the mouse or type a key.

Tip: You can edit or add to the phrases spoken when alerts appear. To do this, select "Edit Phrase List in the popup menu adjacent to "Speak the phrase:" And for extra interest, if you select "Next in the list" (in the same popup menu), then each time an alert appears a different phrase from the list will be spoken. You can make sequences of phrases which work together, such as following "It's not my fault" with "It's still not my fault".

How to annotate texts to improve intelligibility or add emotion

You can use punctuation and embedded commands to improve how the synthesizer speaks text. For example, select the following two texts and compare how they are spoken by the "Victoria, high quality" voice. We recommend that you turn up your volume and close your eyes to make this comparison.

> There are big computers that are difficult to use
> there are small computers that are difficult to use
> And then there's Macintosh.
>
> There are [[emph +]] big computers that are difficult to use,
> there are [[emph +]] small computers that are difficult to use.
> And then [[emph -]] there's: Macintosh!

For more details about how to use these commands, search for "Speech" in Apple Help.

Technical details

The software that enables your computer to speak has these components:

- Speech Manager, a system extension

- one or both of these English speech synthesizers, which are system extensions that convert text to speech
  - MacinTalk 3 for standard speech
  - MacinTalk Pro for high-quality speech
- several voice files, each identified with one particular synthesizer in the Voices folder in the Extensions folder
- the Speech control panel

The Installer removes older versions of Apple's Text-to-Speech software that won't run properly under this Mac OS release.

Troubleshooting (problems and solutions)

My Macintosh won't speak.

- Turn up the speaker volume in the Sound control panel.
- If this doesn't work you may not have enough memory for the voice you have selected. Use the Speech control panel to select "Fred", which is the smallest voice, then click the speaker button. If you hear speech, you did not have enough memory available. Try closing some applications or windows, or selecting a different voice.

The Installer program says there's a problem with the hard disk.

- Re-install your system software, then try installing the English Text-to-Speech software again.

The Installer program displays other error messages.

- Make sure you restart the computer with the Mac OS CD as the startup disk.

I had an older version of text-to-speech software, then did a custom installation of the new software, but some of my older voices disappeared.

- The custom installation erased the older version of the software that uses MacinTalk 2 voices. You can re-install that old software by doing a custom installation from the English Text-to-Speech 1.4.1 installer. You can download the installer from http://www.apple.com/speech.

PowerBook (FireWire): Password Security

You should not use the Password Security control panel on the PowerBook (FireWire) computer.
This article has been archived and is no longer updated by Apple.
The Password Security control panel does not come with the PowerBook (FireWire) computer and cannot be custom installed. If you copy the Password Security control panel from another computer and try to use it on the PowerBook (FireWire), you risk losing data on the PowerBook (FireWire) computer's hard disk.

If you have installed the control panel, an Apple Authorized Service Provider should be able to:

- remove the hard drive from your computer
- move it to an older PowerBook that is compatible with Password Security
- disable the security software
- reinstall the drive in your PowerBook with the data intact.

Mac OS 9: How to Set Date and Time to ISO 8601:1988 Standard

This article explains how to set Mac OS 9's Date & Time control panel to use the ISO 8601:1988 date and time notation standard.
This article has been archived and is no longer updated by Apple.
Follow these steps to set Mac OS 9's Date & Time control panel to use the ISO 8601:1988 date and time notation standard.

1. Open the Date & Time control panel.
2. Click Date Formats. The Date Formats window appears.
3. In the Long Date area, set the pop-up menus to this order:
    - Weekday
    - Day
    - Month
    - Year
4. Delete the comma in the field next to the Month pop-up menu.
5. Click the checkbox to enable "Leading zero for day".
6. In the Short Date area, choose Year/Month/Day from the pop-up menu.
7. Type a hypen in the Separator field.
8. Click the checkboxes to enable "Leading zero for day", "Leading zero for month", and "Show century".

When you have finished these steps, your settings should look like those in Figure 1.

Figure 1 Date Formats window

9. Click OK.
10. Click Time Formats. The Time Formats window appears.
11. Click 24 hour.
12. Click the checkbox to enable "Use leading zero for hour".

When you have finished these steps, your settings should look like those in Figure 2.

Figure 2 Time Formats window

13. Click OK.
14. Close the Date & Time control panel.

More information

For more information on the ISO 8601:1988 standard, Open Sherlock 2 and search for ISO 8601.

Macintosh Manager 1.3: Print Jobs Only Appear to Print

This article discusses an issue where print jobs appear to be sent to the printer, but they are never actually printed. The same jobs print when you log into System Access.
This article has been archived and is no longer updated by Apple.

Symptom

Print jobs appear to be sent to the printer, but they are never actually printed. The same print jobs print when you log into System Access.

Solution

Try these three solutions:

Solution 1

1. Open the Macintosh Manager Admin program.
2. Click the Computers: Security tab.
3. Click to enable the "Applications can: Open other applications, such as helper applications" option.

Solution 2
Turn off background printing. Follow these steps to turn off background printing using the LaserWriter 8 driver:

1. Choose Print from the File menu.
2. Choose Background Printing from the pop-up menu.
3. Click "Foreground (no spool file)" to enable that option.
4. You can force a configured Printing Preferences folder out using the Managed Preferences feature of Macintosh Manager by placing it in the Initial Preferences folder.

Solution 3

1. Allow clients access to the Print Monitor.
2. Instruct clients to open Print Monitor after sending a job to the printer. When Print Monitor opens, it will immediately print all spooled jobs.

Printers that do not work with Desktop Printing
If your Macintosh Manager clients use printers that do not work with Desktop Printing, you should set up and select the printer on the client computer before installing and enabling Macintosh Manager. When you've enabled Macintosh Manager set the workgroup printer option to use the "printer selected in System Access." Be sure to check with the vendor of your printer if it does not work with Desktop Printing for any possible updates or procedures to print in Macintosh Manager or Mac OS 9's Multiple Users environment.

Apple DVD Player 1.0: Limited to Region 1 DVD-Video Discs

You insert a Region 2, 3, 4, 5, or 6 DVD-Video disc into your computer's DVD drive, open Apple DVD Player, and an alert box with this error message appears: "Sorry, this disc cannot be played."
This article has been archived and is no longer updated by Apple.

Symptom

You insert a Region 2, 3, 4, 5, or 6 DVD-Video disc into your computer's DVD drive, open Apple DVD Player, and an alert box with this error message appears:

> "Sorry, this disc cannot be played."

Solution

Apple DVD Player 1.0 was only released in North America and only works with Region 0 and 1 DVD-Video discs. You should use a later version of Apple DVD Player if you need to play discs from a different region. You can update Apple DVD Player 1.0 by downloading and installing Apple DVD Software Update 1.1 from http://www.apple.com/swupdates/ . However, if you have Mac OS 9, you should simply use Apple DVD Player 1.3, which is included with that version of the Mac OS.

See article 60183: "**Apple DVD Player: DVD-Video Region Discussion**" for more information about DVD region codes.

Note: You should only use Apple DVD Player 1.1 or 1.3 if you have a computer with DVD decoding hardware, such as the Power Mac G4 (PCI Graphics), Power Macintosh G3, Power Macintosh G3 (Blue and White), PowerBook G3 Series, and PowerBook G3 Series (Bronze keyboard) computers. Other Macintosh computers with DVD drives should use Apple DVD Player 2.x.

Mac OS 9: Missing Apple Menu Items Could Be Due to Damaged Preferences

A damaged Apple Menu Options Prefs file can cause unexpected Apple menu behavior, such as recent items no longer being listed.
This article has been archived and is no longer updated by Apple.

Symptom

- The Recent Applications, Recent Documents, and Recent Servers folders in the Apple menu are empty, despite items being recently accessed.
- When you open the Apple Menu Options control panel an alert box with this error message appears:

  "There has been an error opening the preferences file. As a result Apple Menu options can not launch."

Solution

Drag the Apple Menu Options Prefs file located in the Preferences folder of the active System Folder to the Trash.
Published Date: Feb 20, 2012

Mac OS: Type 3 or Type 10 error may occur if Internet Config is missing

When opening an application, a Type 3 or a Type 10 error occurs if the Internet Config Extension has been removed from the Extensions folder. You may also see an alert with this message: "[Application] cannot be launched because an unexpected error occurred."
This article has been archived and is no longer updated by Apple.
This can happen with Mac OS 8.1 through 9.0.4

The solution is to install URL Access 2.3 or later, or make sure that the Internet Config Extension is installed in the Extensions folder inside the System Folder. **Note**: The Internet Config Extension does not appear in the Extensions Manager control panel. Check inside the Extensions folder itself for the presence or absence of the Internet Config Extension.

Macintosh: Display Resolution Stays at 640 by 480 When Extensions Are Off

When you start up the computer holding the Shift key, the display stays in 640 by 480 resolution, and never switches to the resolution you set in the Monitors control panel.

This article has been archived and is no longer updated by Apple.

Symptom

When you start up the computer holding the Shift key, the display stays in 640 by 480 resolution, and never switches to the resolution you set in the Monitors control panel.

Solution

When the computer is started with the Shift key down, all system extensions are disabled, including the display extension that loads the display preferences. To see the resolution that you set in the Monitors control panel, you should use the Extensions Manager control panel to enable the system extensions used by your monitor.

Power Macintosh G3: Display Resolution Switches When the Computer Turns On

When the computer starts up the display resolution begins at 640 by 480, and switches during system startup time to the normally selected resolution. The desktop pattern behind the Mac OS logo disappears, and changes to gray until the Finder loads.
This article has been archived and is no longer updated by Apple.

Symptom

When the computer starts up the display resolution begins at 640 by 480, and switches during system startup time to the normally selected resolution. The desktop pattern behind the Mac OS logo disappears, and changes to gray until the Finder loads.

Solution

This is normal behavior.

iPod 2.0: About vCalendar Standard Support

iPod Software 2.0 and later supports industry-standard iCalendar and vCalendar files, which can be exported by many applications including Microsoft Entourage, Microsoft Outlook, and Palm Desktop.
This article has been archived and is no longer updated by Apple.
iPod Software 2.0 and later supports industry-standard iCalendar and vCalendar files, which can be exported by many applications including Microsoft Entourage, Microsoft Outlook, and Palm Desktop.

vCalendar version 1 (the predecessor to iCalendar) is described in the document "vCalendar The Electronic Calendaring and Scheduling Exchange Format Version 1.0" (http://www.imc.org/pdi/).

iCalendar 3.0 is described in RFC 2445, "Internet Calendaring and Scheduling Core Object Specification (iCalendar)" (http://www.imc.org/rfc2445).

The following vCalendar 1.0 components/properties are supported by iPod:

- To-do
- Time Zone
- Alarm (as part of an event)
- Event
- Date/Time Completed
- Date/Time End
- Date/Time Due
- Date/Time Start
- Duration
- Time Zone Offset From (+ or - from UTC only)
- Attendee
- Organizer
- Unique Identifier
- Exception Date/Times
- Exception Rule*
- Recurrence Date/Times
- Recurrence Rule*
- Repeat Count
- Trigger
- Display Alarm
- FREQ

* Daily, weekly, monthly and yearly are supported. Secondly, minutely and hourly are not supported.

The following vCalendar 1.0 properties are ignored by iPod, but are preserved if a .vcs file is stored on an iPod and then transferred back to a computer with an application that support them:

- Delegatees
- Format Type
- Language
- Participation Status
- Participation Role
- RSVP Expectation
- Attachment
- Categories
- Classification
- Description
- Geographic Position
- Location
- Resources
- Status
- Summary
- Time Transparency
- Related To
- Uniform Resource Locator
- Mail reminder
- Procedure reminder
- Date/Time Created

Disc Burner 1.0: Standard Disc (HFS Plus/ISO 9660) Appears As ISO 9660 Disc

A disc prepared as Standard format (HFS Plus/ISO 9660) appears as an ISO 9660 formatted disc on Macintosh computers running Mac OS 8.6 or earlier.

This article has been archived and is no longer updated by Apple.

Symptom

A disc prepared as Standard format (HFS Plus/ISO 9660) appears as an ISO 9660 format disc on Macintosh computers running Mac OS 8.6 or earlier, and Apple CD/DVD Driver 1.2.2 or earlier. ISO 9660 format discs do not include Mac OS Finder information, such as window position, icon position, and Mac OS-style file names. The most obvious difference is that file names are in all capital letters and may be truncated to eight characters, plus a period and a three character extension.

Solution

- Use the disc as you would an ISO 9660 format disc, or upgrade to Mac OS 9.0.4 or later.

Clean Installation or Complete Restore Disables Disc Burner 1.0

If you perform a clean installation or complete restore of Mac OS 9.1 on a Power Mac G4 (Digital Audio) or iMac (Early 2001) computer, you may also need to install Disc Burner software to format CD-R or CD-RW discs.

This article has been archived and is no longer updated by Apple.

Symptom

1. Opening the Disc Burner application results in an alert box with the following error message:
"The application 'Disc Burner' could not be opened because 'PerformanceBurnEngine could not be found."

Figure 1 Disc Burner alert box

2. Inserting an unformatted disc and choosing an option to initialize it results in an alert box with an error message or an unresponsive system.

Solution

Use the Software Update control panel to download and install Disc Burner software on the computer. It can also be downloaded from Apple Software Updates at: http://docs.info.apple.com/article.html?artnum=75106

Note: This error may also occur on any Macintosh computer with a CD-RW, CD-RW/DVD-ROM, or SuperDrive if the Disc Burner Extension has been disabled in Extensions Manager. If Disc Burner Extension is not listed in Extensions Manager and the computer shipped with Mac OS 9.2 or later, then perform a custom Installation of the Disc Burner software. If the computer shipped with an earlier version of the Mac OS then download and reinstall the Disc Burner software from the link above.

Published Date: Oct 7, 2016

Disc Burner: Burn CD Command No Longer Appears in Special Menu

Using the Software Restore disc to "Restore in Place" may remove the Burn CD command from the Finder's Special menu. You may also need to install Disc Burner software in order to see all the Disc Burner menu commands in the Finder.

This article has been archived and is no longer updated by Apple.

Symptom

CD-R and CD-RW discs can be initialized, but the Burn CD command is no longer available from the Finder's Special menu.

Solution

Disc Burner 1.0 and later installs Finder 9.1.1, which may be newer than the version of the Finder installed during a Restore in Place. Use the Software Update control panel to download and install Disc Burner software on the computer. It can also be downloaded from Apple Software Updates (http://www.apple.com/swupdates/).

iTunes: How to Synchronize the Library

This article explains how to synchronize the iTunes Library on two different computers running Mac OS 9.
This article has been archived and is no longer updated by Apple.
To synchronize the iTunes Library on two different computers running Mac OS 9.:

1. Share the hard disk of one computer.
2. Connect to the computer with the shared hard disk.
3. Open the File Synchronization control panel.
4. Open your computer's hard disk.
5. Open the Documents folder.
6. Drag the iTunes folder into the left or right area on the File Synchronization control panel.
7. Open the shared hard disk of the other computer.
8. Open the Documents folder.
9. Drag the iTunes folder into the opposite area on the File Synchronization control panel.
10. Click Synchronize.

For more information on sharing files with other computer, choose Mac Help from the Finder's Help menu and search on "file sharing".

iDVD: Questions and Answers

Learn the answers to the frequently asked questions (FAQ) regarding the current version of iDVD.

For the latest information on iDVD, please visit http://www.apple.com/idvd.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. What is iDVD?
2. How do I get iDVD?
3. Can I play the DVDs I make with iDVD on the DVD player that's connected to my TV? What about on my computer's DVD player?
4. Which software applications from Apple allow me to author and encode DVDs on Macintosh computers?
5. In what ways do iDVD and DVD Studio Pro differ?
6. How do I prepare my movies and pictures for use in iDVD?
7. Can I only use iDVD with a built-in Apple SuperDrive?
8. Does iDVD require special discs?
9. How much material can a single DVD disc hold?
10. Is Dolby Digital AC-3 or Digital Theater Sound (DTS) supported by iDVD?
11. Can I set the region code?
12. Can I protect my disk from unauthorized copying?
13. Do I have to burn a disk to test my final product?

Question 1: What is iDVD?

Answer: iDVD is a software application from Apple that enables you to author desktop movies and still images, then write the project to a recordable DVD disc using an Apple DVD-R drive. With iDVD, you have simple-to-use tools for making DVD-Video discs on your Macintosh and a great way to share your movies and still pictures with anyone who has a DVD player.

Question 2: How do I get iDVD?

Answer: iDVD 6 is part of iLife ’06. iLife ’06 is available for purchase separately and also comes installed in all new iBook, iMac, eMac, PowerBook, MacBook Pro, Mac mini and Power Mac computers.

Question 3: Can I play the DVDs I make with iDVD on the DVD player that's connected to my TV? What about on my computer's DVD player?

Answer: DVD discs created with iDVD on an Apple DVD-R drive are compatible with most standard set-top and computer-based DVD players.

Question 4: Which software applications from Apple allow me to author and encode DVDs on Macintosh computers?

Answer: Two software applications from Apple allow you to create DVD discs: iDVD and DVD Studio Pro. iDVD is a simple way for beginners to get started creating their own DVD discs. DVD Studio Pro is a full-featured software package that offers additional, professional-level functionality.

Question 5: In what ways do iDVD and DVD Studio Pro differ?

Answer: iDVD provides the tools to create DVDs containing video and still images with simple menu navigation. Its drag-and-drop ease of use and predesigned themes make iDVD ideal for non-experts who want to get started creating DVD discs right away. DVD Studio Pro is a professional DVD authoring tool. It allows you to create DVD discs that include every feature outlined in the DVD-Video specification, with video, still images, audio, and even web links. DVD Studio Pro is most appropriate for projects that require copy protection, scripting, multiple languages, subtitles, Dolby Digital and DTS audio and many other advanced features. When it comes to burning DVD discs, iDVD is designed to work only on computers with built-in Apple SuperDrives. DVD Studio Pro offers numerous methods for outputting a finished DVD-Video project, including and beyond the Apple SuperDrive.

Question 6: How do I prepare my movies and pictures for use in iDVD?

Answer: iDVD accepts movies in QuickTime format, which is supported by most video editing and creation tools. Still pictures can be any QuickTime-compatible format, such as PICT, TIFF, or JPEG. Starting with iLife '04, there are special buttons to send your photos from iPhoto or your project from iMovie directly to iDVD. In iDVD, movies are converted into MPEG-2 format just before they are written to the DVD disc.

Question 7: Can I only use iDVD with a built-in Apple SuperDrive?

Answer: iDVD 5 allows you to "Save As Disc Image" and then you can use Disk Utility to burn to a third-party DVD burner. iDVD 6 allows you to burn directly to a third-party drive.

Question 8: Does iDVD require special discs?

Answer: iDVD uses standard blank DVD-R discs, called DVD-R General. The General designation distinguishes these discs from those labeled Authoring. Authoring discs are used in professional DVD authoring drives. With some Superdrives, you can use DVD+R, DVD+RW, DVD-RW, and DVD+R DL discs also.

Question 9: How much material can a single DVD disc hold?

Answer: A DVD-R disc can hold about 4.7 GB. This allows up to 120 minutes of high-quality video to fit on a DVD.

Question 10: Is Dolby Digital AC-3 or Digital Theater Sound (DTS) supported by iDVD?

Answer: iDVD only supports audio formats playable in QuickTime. DVD Studio Pro supports Dolby Digital AC-3 and DTS audio formats.

Question 11: Can I set the region code?

Answer: DVD-Video discs created with iDVD will have set the region code such that the discs will be playable in all regions. If you are interested in setting region codes to specific regions, DVD Studio Pro offers that functionality.

Question 12: Can I protect my disc from unauthorized copying?

Answer: iDVD does not include CSS (Content Scrambling System), Macrovision or any other copy protection schemes. DVD Studio Pro offers CSS and Macrovision features.

Question 13: Do I have to burn a disk to test my final product?

Answer: No. iDVD has a preview function. You can also save your project as a Disc Image, which allows you to view it on your computer using Apple DVD Player before you burn a disc.

iTunes: Using the Radio Tuner Behind a Firewall

The iTunes Radio Tuner feature may not work if your network access is limited by a firewall.
This article has been archived and is no longer updated by Apple.

Symptom

You double-click a stream in the iTunes Radio Tuner, but iTunes is unable to access the stream.

Solution

If your network access is limited by a firewall, and the iTunes Radio Tuner feature does not work, contact your network administrator for assistance.

The iTunes Radio Tuner feature may not work if your network access is limited by a firewall. Different Radio Tuner streams use different firewall ports, which may be blocked. To listen to a Radio Tuner stream, your network administrator would have to open the firewall to allow access through the port used by that stream. Some streams use ports in the 8000 range, while others use ports in 42000 range.

If your network administrator opens the port(s) you can make the appropriate settings in the Firewalls section of the Internet control panel's Advanced tab.

For more information about firewalls and ports, see article 24514: "**TCP/IP: Ports And Firewalls Explained**."
Published Date: Oct 7, 2016

DVD-R for Authoring Versus DVD-R for General Media

Learn the difference between DVD-R for Authoring and DVD-R for General media.

This article has been archived and is no longer updated by Apple.

There are two types of DVD-R media: DVD-R for Authoring, and DVD-R for General. While both types of DVD-R media can be played back equally well on DVD players or DVD-ROM drives that are compatible with DVD-R playback, each type of media must be matched to the proper DVD-R recorder when recording.

Apple's SuperDrive writes only to DVD-R for General media. As of 2001-02 a drive that can record to both types of media is not available.

Why two formats?

The principle reason for DVD-R for General media is that it contains content protection measures that make it physically impossible to make bit-for-bit copies of CSS-encrypted entertainment titles.

Professional Authoring

Either type of DVD-R media can be used for DVD-Video authoring, which is the process of preparing video content for use in DVD players. Apple's SuperDrive and DVD-R for General media can be used for this purpose.

However, to use CSS encryption, or to prepare a DVD-Video for mass replication you should use a third-party DLT tape drive, or a DVD recorder that can write to DVD-R for Authoring media as outlined below.

CSS encryption

- DVD Studio Pro
- third-party DLT tape drive

Note: DVD-R media cannot be used with CSS-encrypted video.

Mass replication

- DVD Studio Pro
- third-party DLT tape drive
- third-party DVD recorder that can write to DVD-R for Authoring media, such as Pioneer's DVR-S201

iTunes: About Variable Bit Rate Encoding

This article has been archived and is no longer updated by Apple.

This article explains the function of the Variable Bit Rate Encoding (VBR) option in iTunes.

When the Use Variable Bit Rate Encoding option is enabled in iTunes Preferences, iTunes automatically raises and lowers the compression bit rate in order to keep a consistent level of quality. For example, if there is a point in the source music that contains a wider range of frequencies, iTunes increases the bit rate. Conversely, if there is a point that contains a narrower range of frequencies, the bit rate is decreased. iTunes does not allow the bit rate to go lower than the bit rate settings you've chosen.

See this document for steps to access VBR settings for a Mac, along with additional custom settings. See this document for steps to access VBR settings in Windows, along with additional custom settings.

The MP3 encoder has a Quality pop-up menu lets you choose how strictly you want iTunes to maintain bit rates that provide a particular quality. Higher quality settings use higher bit rates, which create larger files but with higher quality music playback.

Apple DVD Player: Why Black Bars Surround the Picture

This article discusses when, why, and where you will see black bars while watching a movie from a DVD-Video disc with Apple DVD Player. This article has been archived and is no longer updated by Apple.

Question Why are there black bars on the top and bottom of the movie I'm watching from a DVD-Video?

Answer
The distributor of the movie wanted you to enjoy the full widescreen version of the movie. Because the movie has a wider aspect ratio than the average computer monitor and television, black bars are placed (or *matted*) onto the video.

Question What are "aspect ratios" ?

Answer Movies on DVD-Video discs have many different aspect ratios (the ratio of a movie image's width to its height). These ratios are expressed in units of width to units of height. The most common ratios for movies on DVD-Video discs are 1.33:1, 1.85:1, and 2.35:1. Most televisions and computer monitors have a fixed ratio of four units to three, often expressed as 4:3. Some televisions have a ratio of 16:9, also known as widescreen or letterbox.

Question How does the aspect ratio of the original movie differ from that of the video on the DVD?

Answer The video on the DVD itself is in standard NTSC or PAL format such that the aspect ratio is always 4:3. So, the aspect ratio of the original movie must be adapted to the standard aspect ratio of 4:3. How this is accomplished, combined with the aspect ratio of the screen used to view the DVD, will determine whether black bars appear, where they appear, and how big they are.

Question I see movies on television all the time that have no black bars. Why do I have to see them now?

Answer Movies on television are often cropped so that the movie fits the entire screen. Depending on the original aspect ratio of the movie, up to 40 percent of the picture can be lost. If you prefer movies in this format, look for DVD-Video titles that include a "standard format" version.

Question I get black bars on the *sides* of the screen. Why is this?

Answer If your display is wider than 4:3 (like the Apple Cinema Display at 8:5 or the PowerBook G4 at 3:2) and the DVD-Video title uses a 4:3 aspect ratio (like a standard format movie or any content that was originally broadcast for television), the picture would have to be stretched horizontally to occupy the full width of the screen. Further, widescreen format DVD titles will have bars on the top, bottom, and sides of the screen if they are not anamorphically encoded and are viewed on a wide-format display.

Question What is anamorphic encoding?

Answer Some movies use anamorphic encoding to minimize the use of the black bars and increase the resolution of the picture. This technique stretches the image vertically before transferring it to the 4:3 format. When the movie is played back, the DVD player detects that it is an anamorphic title and stretches the video horizontally. If your display has a wide format aspect ratio (like the Apple Cinema Display or the PowerBook G4) the movie can span the full width of the display. When anamorphic encoding is used, the resulting video occupies a 16:9 aspect ratio. DVD-Video titles using this encoding will usually state on the back of the box that the movie uses anamorphic encoding, or has been "enhanced for widescreen TVs". However, some titles do not state this feature on the box at all.

SuperDrive: Ejects DVD-RAM Discs

The SuperDrive, included with some Power Mac G4 and iMac (Flat Panel) computers, does not read DVD-RAM discs.

This article has been archived and is no longer updated by Apple.

Symptom

The DVD drive ejects every DVD-RAM disc, but accepts DVD-ROM and DVD-R discs, which appear on the desktop without any issues.

Solution

The SuperDrive does not read DVD-RAM discs and will eject them. They will not appear on the desktop, nor will the Finder display an alert box or error message. For more information about the discs that are compatible with the SuperDrive, see article 58770 "**CD-RW and SuperDrive: Specifications and Usage Information**."

Published Date: Feb 19, 2012

DVD Studio Pro 1.0: FAQ

This document contains frequently asked questions (FAQ) regarding DVD Studio Pro 1.0, with answers to those questions. See also document 61587: "**DVD Studio Pro 1.5: Frequently Asked Questions**."

This article has been archived and is no longer updated by Apple.

Questions answered in this document

1. What is DVD Studio Pro?
2. How does DVD Studio Pro differ from iDVD?
3. Can I make both still and motion menus using DVD Studio Pro?
4. Can I add web links to DVDs authored in DVD Studio Pro?
5. DVD audio is encoded in Dolby, but QuickTime is the standard audio format for digital video edited on a computer. Which format works in DVD Studio Pro?
6. To what formats can I output a project authored in DVD Studio Pro?
7. Which DVD recorders does DVD Studio Pro support?
8. Is there any difference between discs written with the Apple DVD-R drive and those written with the Pioneer DVD-R recorder?
9. I don't have a DVD recorder. How can I burn DVD discs using the content I've authored in DVD Studio Pro?
10. What are 4:3 and 16:9 aspect ratios?
11. What is anamorphic media?
12. What operating systems support DVD Studio Pro?
13. What software comes with DVD Studio Pro?
14. What are the system requirements for DVD Studio Pro?

Question 1: What is DVD Studio Pro?

Answer: DVD Studio Pro is an application that makes it easy for non-specialists to author and encode professional-quality DVD-Video discs on their Macintosh desktop. Tight integration with the Apple DVD-R drive on select Power Mac G4 systems makes it easy to record DVDs as well.

DVDs authored with DVD Studio Pro are fully compatible with the DVD-Video standard, and will run on most TV- and computer-based players that are compliant with the DVD-Video standard.

Source material can be either QuickTime movies or MPEG streams. DVD projects authored with DVD Studio Pro can include every feature that the DVD-Video standard allows, including up to 99 video tracks, Dolby Digital AC-3 audio, web links, and slide shows. If you're shooting and editing digital video, you can now retain digital quality and precision from start to finish. What was once a very expensive and technical undertaking is now more affordable and much easier than ever before.

Question 2: How does DVD Studio Pro differ from iDVD?

Answer: DVD Studio Pro gives you access to the entire range of features outlined in the DVD-Video specification. iDVD, on the other hand, gives you just the basic capabilities needed to put video and still images on a DVD. For example, iDVD offers simple, preset menu navigation templates, whereas DVD Studio Pro gives you complete control over the navigation structure. If you want your project to include advanced features such as scripting, multiple languages, subtitles, and Dolby Digital audio, you'll want to choose DVD Studio Pro.

Question 3: Can I make both still and motion menus using DVD Studio Pro?

Answer: Yes. Motion menus are video clips designated to function as menus. The clips can be created in a video editor such as Final Cut Pro, then imported into DVD Studio Pro. Still menus are created using images created in applications such as Photoshop. When working with Photoshop graphics, you can choose which layers are visible at any time without having to flatten or convert the Photoshop files.

Question 4: Can I add web links to DVDs authored in DVD Studio Pro?

Answer: DVDs have a unique advantage over videotape because they can include web links. In DVD Studio Pro, this feature is made possible by Apple DVD@CCESS technology. Web connections let your viewers access late-breaking information that's relevant to the content of your project. They also let businesses create promotional DVDs that link their audience directly to their web store. With web links, salespeople can enhance their presentations by jumping to up-to-date, web-based inventory and pricing details.

Question 5: DVD audio is encoded in Dolby, but QuickTime is the standard audio format for digital video edited on a computer. Which format works in DVD Studio Pro?

Answer: You can use your multichannel QuickTime audio files as the source for encoding into Dolby AC-3 format. Or you can use uncompressed

AIFF or QuickTime sound files for stereo audio.

Question 6: To what formats can I output a project authored in DVD Studio Pro?

Answer: After you complete authoring and testing your project in DVD Studio Pro, the software allows you to output your work in the format that best fits your audience and budget. You can

- Output your project in DVD-R format and record it using the DVD-R drive on your new Power Mac G4, or deliver it to a DVD service bureau for recording.
- Transfer your project to digital tape and deliver it to a replicator for mass duplication.
- Select DVD-RAM format to record your project using a computer DVD-RAM drive. This is an inexpensive way to test your project before committing it to other media.

Question 7: Which DVD recorders does DVD Studio Pro support?

Answer: DVD Studio Pro supports the Apple DVD-R drive available on select Power Mac G4 systems as well as the Pioneer DVR-S201 DVD recorder.

Question 8: Is there any difference between discs written with the Apple DVD-R drive and those written with the Pioneer DVD-R recorder?

Answer: Yes. The Pioneer DVR-S201 recorder writes DVD-R Authoring media. These discs can be used as masters for replicating multiple DVD discs. The Apple DVD-R drive writes DVD General media, which are not intended for use as replication masters. If you are creating a project for replication, output your DVD Studio Pro project to digital tape or use a DVD-R Authoring disc as a master.

Question 9: I don't have a DVD recorder. How can I burn DVD discs using the content I've authored in DVD Studio Pro?

Answer: If your Macintosh does not have a DVD-R drive, you can still use DVD Studio Pro to author and test your projects. You can hire a DVD service bureau to create the discs for you. Just output your content onto digital tape or deliver your work on a portable hard drive. You can also output your work onto a DVD-RAM disc, then play it on a computer with a DVD-RAM drive.

Question 10: What are 4:3 and 16:9 aspect ratios?

Answer: Standard NTSC and PAL televisions have a picture aspect ratio of 4:3 and many new DV devices support a picture aspect ratio of 16:9. DVD Studio Pro supports the acquisition, creation, and distribution of 16:9 and anamorphic media. On DV devices that have a 16:9 setting, DVD Studio Pro captures and exports the proper 16:9 image.

Question 11: What is anamorphic media?

Answer: Some widescreen video material is shot using a special anamorphic lens that squeezes the wide image horizontally so it can be captured on the standard 4:3 aspect ratio of video. When this material is played back, it needs to be expanded horizontally to match the original shape. DVD Studio Pro can work with this anamorphic material and instructs DVD players to restore the shape on playback.

Question 12: What operating systems support DVD Studio Pro?

Answer: DVD Studio Pro works with Mac OS 9.0.4 through 9.2.2. DVD Studio Pro 1.0 is not compatible with the Classic environment of Mac OS X.

Question 13: What software comes with DVD Studio Pro?

Answer: The DVD Studio Pro package offers several tools:

- DVD Studio Pro software for authoring and testing DVDs
- QuickTime MPEG Encoder software
- DVD@CCESS software to create DVDs that support web links
- A.Pack Dolby digital encoding software to produce high-quality surround sound audio
- Subtitle Editor software to create subtitles
- QuickTime Pro software to update your computer's QuickTime capabilities
- Instruction manual with a comprehensive tutorial and sample files to make learning DVD Studio Pro easy

Question 14: What are the system requirements for DVD Studio Pro?

Answer: DVD Studio Pro requires a Power Mac G4 computer with an Apple-supplied AGP graphics accelerator. The earliest Power Mac G4 computers, which featured PCI-based graphics cards, are not supported. Recommended RAM is at least 128 MB. The amount of hard disk space needed for authoring depends on a number of factors, including the compression format of the source material and the length of the project. A typical DVD-5 project with DV source material uses about 20 GB of disk space. DVD Studio Pro can take advantage of large displays; a display resolution of at least 1024 by 768 pixels is recommended. Mac OS 9.0.4 or 9.1 is required.

iDVD 1.0: Cannot Import MPEG 1 Video

iDVD 1.0 cannot import MPEG 1 video, even though QuickTime can import it, and the iDVD help files indicate that iDVD can use any QuickTime video file.
This article has been archived and is no longer updated by Apple.

Symptom

You're unable to import an MPEG 1 video file into your iDVD project. QuickTime Player can read and play the file, and iDVD Help says: "You can add any video or image file supported by QuickTime to your iDVD project."

Solution

iDVD 1.0 cannot read MPEG 1 video files. The Help file is in error. You may be able to convert your MPEG 1 video files to a different QuickTime format that iDVD can read by using the Cleaner 5 application from Terran (http://www.terran.com/).

This article provides information about a non-Apple product. Apple, Inc. is not responsible for its content. Please contact the vendor for additional information.

The following article can help you search for a particular vendor's address and phone number:

Article 17159: "**Locating Vendor Information**"

Note: MPEG 1 files in QuickTime are technically not video tracks, they're MPEG tracks. iDVD can import files that are QuickTime video tracks.

Apple DVD Player: Movies Play in Slow Motion

This article describes an issue where movies may occasionally play in slow motion, stutter, or stop playing when you watch them from a DVD-Video disc on your computer.
This article has been archived and is no longer updated by Apple.

Symptom

When watching a movie from a DVD-Video disc, the sound stutters, the movie plays in slow motion (two or three frames per second), or it completely stops playing.

Solution

1. Make sure you have installed the latest version of the Mac OS and Apple DVD Player software.
2. If you are using latest version of Apple DVD Player, use the tips in article 58383: "**Apple DVD Player: Troubleshooting Video Issues**" to eliminate any other possible causes.

If the DVD-Video title uses "Concealment Motion Vector" (CMV) encoding, a type of encoding used in some countries, including Japan, the video will appear to play very slowly in Apple DVD Player. Download and install **Apple DVD Player 2.7** or later to correct this issue.

El Reproductor DVD 2.0 de Apple: No es compatible con el Mac OS 9.1

This article has been archived and is no longer updated by Apple.

Es posible que el Reproductor DVD de Apple no funcione después de actualizar el sistema al Mac OS 9.1.

Síntoma

Después de actualizar el sistema al Mac OS 9.1, al abrir la aplicación Reproductor DVD de Apple aparece el siguiente mensaje de alerta:

"El Reproductor DVD de Apple no es compatible con la tarjeta de vídeo de la pantalla principal".

Productos a los que afecta

- iMac (carga por ranura)
- Power Mac G4 (AGP)
- PowerBook (FireWire)

Solución

Importante: Las versiones actualizadas del Reproductor DVD de Apple ya han solucionado este problema. Consulta el documento 26201 para descargar el Reproductor DVD 2.4 de Apple o el documento 120022 para descargar el Reproductor DVD 2.7 de Apple.

El motivo de este error es el Reproductor DVD de Apple no estaba actualizado a la versión 2.2 antes de instalar la Actualización Mac OS 9.1. El Mac OS 9.1 sólo admite las versiones Reproductor DVD 2.2 de Apple y posteriores; no es compatible con la versión Reproductor DVD 2.0b de Apple que se incluye con el Mac OS 8.6 ni con la versión Reproductor DVD 2.0 de Apple que se incluye con el Mac OS 9.0 a 9.0.3. El Reproductor DVD 2.2 de Apple está disponible en la sección de Descargas de software Apple.

Si intentas instalar el Reproductor DVD 2.2 de Apple a un ordenador actualizado con el Mac OS 9.1 utilizando la actualización descargable y no la de CD-ROM, aparecerá el siguiente mensaje de alerta:

"No es posible instalar el Reproductor DVD de Apple en un volumen que no disponga de la versión para EE.UU., G.B. o Internacional del Mac OS 9.0.1 o posteriores".

Para instalar el Reproductor DVD 2.2 de Apple:

1. Reinicia el ordenador desde el CD de Instalación del sistema. Consulta el documento 50055: "Miscellaneous Manuals". Selecciona el Manual de solución de problemas - Arranque desde CD.
2. Ejecuta una instalación desde cero del Mac OS 9.0.2, 9.0.3 o 9.0.4. Se instalará una nueva Carpeta del Sistema y la anterior pasará a llamarse Carpeta Anterior del Sistema. Consulta el documento 60496: "Mac OS 9: Performing a Clean Installation" (ver Nota 1).
3. Al finalizar la instalación, sal del Instalador e instala el Reproductor DVD 2.2 de Apple.
4. Al finalizar la instalación, sal del instalador y mueve la carpeta del Reproductor DVD de Apple de la carpeta Applications a la carpeta Applications (Mac OS 9). Es posible que aparezca un mensaje de alerta que te pida autorización para reemplazar un elemento anterior con el mismo nombre; haz clic en OK.
5. Abre la Carpeta del Sistema
6. Abre la Carpeta Extensiones
7. Arrastra las siguientes extensiones al primer nivel del disco duro:
    - - DVD AutoLauncher
    - - DVD Decoder Library (tal vez sólo en equipos iMac)
    - - DVD Navigation Manager
    - - DVD Region Manager
    - - DVD Runtime Lib
8. Arrastra estas extensiones a la carpeta Extensiones de la Carpeta Anterior del Sistema.
9. Arrastra las siguientes extensiones a la Papelera:
    - - Carpeta del Sistema
    - - Applications (**Atención**: NO la carpeta Applications (Mac OS 9))
    - - Apple Extras
    - - Assistants
    - - Internet
    - - Utilities
    - - Web pages
10. Cambia el nombre Carpeta Anterior del Sistema por Carpeta del Sistema.
11. Para confirmar esta Carpeta del Sistema: ábrela, abre el archivo Sistema (icono de maletín) y cierra ambas.

12. Reinicia el ordenador.

Ahora ya debe ser posible ejecutar el Reproductor DVD de Apple con el Mac OS 9.1.

Este problema no tiene por qué ocurrir si se actualiza el sistema al Mac OS 9.1 con el CD-ROM correspondiente. El disco permite la instalación completa y desde cero. Si ya dispones de una versión del Mac OS 9, puedes comprar la actualización al Mac OS 9.1 a precio reducido. Para más información, visita la sección Software en http://www.apple.com/.

Notas:

1. 1. Si dispones del CD de Instalación del Mac OS 8.6 CD, deberás actualizar el sistema al Mac OS 9 e instalar la actualización Mac OS 9.0.4. Si dispones del CD de Instalación del Mac OS 9, deberás instalar la actualización Mac OS 9.0.4. La actualización Mac OS 9.0.4 está disponible en http://www.apple.com/support/downloads/.

Mac OS 9: Help Viewer "Not Enough Memory" Message

An alert box may appear with a message that there is not enough memory to use Mac Help, particularly after updating or installing new software on your computer.

This article has been archived and is no longer updated by Apple.

Symptom

When you try to search Mac Help, an alert box with this message appears:

> "There is not enough memory to complete this operation. Quit other open applications and try again."

However, the Finder indicates that there is an adequate amount of available memory.

Solution

Remove the file "Help Viewer Accessors" from the Apple Help Prefs folder in the Preferences folder.

Disc Burner 1.0.1: Does Not Work With SCSI CD-RW Drives

You cannot burn discs with Disc Burner 1.0.1 and a SCSI CD-RW drive.

This article has been archived and is no longer updated by Apple.

Disc Burner 1.0.1 is compatible with some third-party CD-RW mechanisms.

These CD drive mechanisms are supported:

- LG (CD-RW CED-8042B)
- Matshita (CD-RW CW-7121, CD-RW CW-7586, UJDA310)
- Mitsumi (CR-4802TE, CR-4804TE)
- Philips Iomega (CDD4801 CD-R/RW, ZIPCD 650)
- Pioneer (DVD-RW DVR-103)
- Plextor (CD-R PXW1210A, CD-R PX-W8432T, CD-R PX-W8220T, CD-R PX-W124TS)
- Ricoh (CD-R/RW RW8040A)
- Samsung QPS (CD-R/RW SW-208B)
- Sanyo LaCie (CDBP-121032, CDBP-161040, CRD-BP1300P)
- Sony (CD-RW CRX140E, CD-RW CRX700E, CD-RW CRX140, CD-RW CRX145, CD-RW CRX160, CD-RW CRX700, CD-RW CRX10U)
- Teac (CD-W24E)
- Yamaha (CRW4416, CRW6416, CRW8424, CRW8824, CRW2100)

These mechanisms are compatible with Disc Burner software when they are used in USB or FireWire drives, but not in SCSI drives.

See software download document 75106 "**Disc Burner 1.0.1 Document and Software**" for additional information.

Mac OS 9.1 and Software Updates: .smi Disk Image Volumes Appear Empty

On computers with Mac OS 9.1, a self-mounted disk image volume may appear to be empty the first time it appears on the desktop. This type of disk image is frequently used for Apple software downloads.
This article has been archived and is no longer updated by Apple.

Symptom

A disk image volume appears to be empty.

Note: A disk image **volume** has an icon that looks like a disk and a filename without any extensions. It behaves like a disk. A self-mounting disk image **file** has an icon that looks like a file (a paper with a dog-eared corner) and a filename extension of ".smi".

Solution

1. Drag the icon of the disk image volume to the Trash. **Important:** This icon's filename does not have an extension such as ".smi" or ".img".
2. Double-click the self-mounting disk image file with a filename extension of ".smi". A new disk image volume icon appears on the desktop, and its contents should be visible.

For additional information on this issue, see technical document 75098 "**Software Downloads: Software Format and Assistance**".
Published Date: Feb 20, 2012

Disc Burner: How to Use Saved Disk Images

This article explains what to do with the Disk Copy image file named "DiscBurnerImage" that may be created if a burn did not successfully complete.

This article has been archived and is no longer updated by Apple.

Disc Burner gives you the option of saving the data you are attempting to burn as a Disk Copy disk image file if an alert box with any of these messages appears:

"The burn cannot proceed because the startup disk is full."
"The burn cannot proceed because the disc is too full."
"The burn cannot proceed because the disc contains filenames that could not be converted."
"The burn cannot proceed because the disc has folders nested deeper than 8 levels."

Once you address the issue that prompted the burn to stop, follow the steps below. See Figure 1 for help in identifying the respective icons of the files mentioned because some of the names can vary.

Figure 1 File icons

A. The DiskBurnerImage file moved from the preferences folder to the desktop

B. The disk image file (with the default name) made available on the desktop when you double-click the DiskBurnerImage file.

C. The CD-R/CD-RW disc icon representing the blank disc with the default name.

Follow these steps to burn a disc from the saved DiscBurnerImage file:

1. Locate the file named "DiscBurnerImage" in the Preferences folder and drag it to the desktop. Depending on how many discs you have saved, you may have other files with a number following the name (DiscBurnerImage1, DiscBurnerImage2, and so forth).

2. Double-click the DiscBurnerImage icon to make the disk image available on the desktop.

When the disk image appears on the desktop, you will see a new icon with the name that you originally used for the CD-R or CD-RW disc. If you did not change the name, then it will appear with the default name "untitled" as in Figure 1.

3. Insert the blank CD-R or CD-RW media you want to use. Prepare it as you did previously. You may notice a new "DiscBurnerImage" file in the Preferences folder. Do not move or remove this file. It will be automatically removed when the burn is completed.

4. Open disk image file (named untitled, or the name you gave the disc). Choose Select All from the Edit menu and drag the files from the window to the CD-R or CD-RW icon on the desktop.

When the files are done copying, click the disk image file to select it and choose Put Away from the File menu.

5. Drag the file "DiscBurnerImage" on the desktop to the Trash.

6. Continue to burn the disc as normal by selecting the disc icon and then choosing Burn CD-R from the Special menu.

Final Cut Pro: Requires Apple CPU Plugins 2.7 or Later

On Power Mac G4 computers with dual G4 microprocessors, you should have version 2.7 or later of Apple CPU Plugins installed in the Extensions:Multiprocessing folder.

This article has been archived and is no longer updated by Apple.

Symptom

Final Cut Pro stops responding, mouse clicks have no effect, or video stops playing while audio continues and the dropped frame alert appears.

Solution

Download and install Apple CPU Plugins 2.7. The software can be downloaded from article 88054 "**Apple CPU Plugin Document and Software**."

Published Date: Feb 20, 2012

Mac OS 9: Type 41 Error and VistaScan Software

An alert box with a positive or negative error type 41 may appear when certain versions of UMAX scanner software are installed and the computer is waking from sleep mode.
This article has been archived and is no longer updated by Apple.

Symptom

An alert box with a positive or negative error type 41 may appear on screen when certain versions of scanner software are installed and the computer is waking from sleep mode. The alert may also occur at shutdown, restart, when the Finder is forced to quit, or when the Finder reloads in a multi-user environment.

Solution

UMAX has updated the VistaScan software to version 3.75. Contact UMAX for information on obtaining this update.

Temporarily, you could disable the VS Control Strip module to alleviate this alert box prior to updating the software. To do this, locate the file in the Control Strip Modules folder in the System Folder and drag it to the desktop. Note that there is a space at the beginning of the filename so when viewing the Control Strip Modules folder by name, look towards the top.

AppleScript 1.6: What‘s New and Different from AppleScript 1.5.5

AppleScript 1.6 for Mac OS 9.1 can be installed in three ways: by using the Software Update control panel, by downloading the software from Apple Software Updates, and by running the Classic environment on a computer with Mac OS X.

AppleScript 1.6 for Mac OS 9.1 is functionally compatible with AppleScript 1.6 for Mac OS X, though there are differences in behavior due to differences between Mac OS 9.1 and Mac OS X.

This article has been archived and is no longer updated by Apple.

What's New in AppleScript 1.6 and Different From AppleScript 1.5.5

AppleScript 1.6 for Mac OS 9.1 (like AppleScript 1.6 for Mac OS X) has several substantial changes and improvements from version 1.5.5, which is included with Mac OS 9.1. If you use the Unicode Text or Read/Write Commands features of AppleScript, you should quickly upgrade to AppleScript 1.6 for Mac OS 9.1. Like AppleScript 1.5.5, AppleScript 1.6 will function only with Mac OS 9.1 or later.

Stability and Reliability

AppleScript 1.6 fixes a long-standing issue in AppleScript in which scripts may claim to run out of memory, even when plenty of memory is available. AppleScript 1.4.3 and 1.5.5 also had rare issues with applets losing track of global variables; these issues have been fixed in AppleScript 1.6.

Support for Large Files in Read/Write Commands

The Read/Write commands in Standard Additions 1.6 now can work with files greater than 2 GB in size. In addition, all of the issues introduced in the Read/Write commands in AppleScript 1.5 and 1.5.5 have been fixed, and several long-standing issues with reading and writing lists and records have been fixed.

Note: AppleScript 1.6 introduces a known issue with the read command when using both the "as list" and "using delimiters" parameters. Where previous versions would return a list of strings, AppleScript 1.6 returns a list of one-item lists. Also, using the read command with the "before or until" parameter and an "as" parameter of a type other than text will return erroneous results. These issues will be addressed in a future release of AppleScript.

Support for Unicode

The Unicode text data type has been growing in functionality since version 1.3 and is now comparable in functionality with the string data type. Not only can Unicode text strings be received from and sent to applications, they display properly in the Results and Event Log windows of the Script Editor (and third-party editors); they can be accessed with the character, word, paragraph, and text item element classes and the first, last, middle, some, and every access forms; they can be operated on with the & (concatenation) operator; and they can be compared with the less than, greater than, less than or equal to, greater than or equal to, equals, contains, is contained by, begins with, and ends with operators. For text item elements of a Unicode string, the text item delimiters can be either string or Unicode text values. When comparing Unicode strings, the considering and ignoring constructs are supported for case, diacritical marks and punctuation.

Support for Mac OS X

AppleScript 1.6 supports many changes in general system operation introduced in Mac OS X. It can use applications and scripting additions that are stored as "bundles" or "packages" for Mac OS X. It can load scripts and application terminologies from files that do not have traditional Mac OS resource forks. It accommodates the fact that many Mac OS X applications actually have a ".app" filename extension that is hidden from the user.

No Dependence on Security Library

The Standard Additions functionality in AppleScript 1.5.5 depended on the presence of the Security Library system extension in order to function. In Standard Additions 1.6, if the Security Library is missing or disabled, only the mount volume command's ability to use the Keychain will be disabled, but all other Standard Additions features will be available.

Other Changes and Improvements

AppleScript 1.6 has improvements to the random number command, to make random numbers more evenly distributed and less predictable; it returns more correct results from certain unusual operations (item 0 of a list, set text item delimiters to {}, strings of a string, strings of a list that doesn't contain strings) where previous versions of AppleScript would return unhelpful results or fail to signal appropriate errors.

Note: AppleScript 1.6 introduces a known issue with using the mount volume command to mount volumes hosted on certain kinds of servers,

especially computers with Windows 2000. This issue is expected to be addressed in a future version of AppleScript.

For More Information

To download AppleScript 1.6, see article 120001: "**About AppleScript 1.6**".

See the AppleScript Web site (http://www.apple.com/applescript/).

Mac OS 9FU: "Table du système de fichiers incorrecte" Alert at System Startup Time

This article explains what to do if an alert box with this message appears: "Table du système de fichiers incorrecte."
This article has been archived and is no longer updated by Apple.

Symptom

The computer stops responding at system startup time and an alert box with this message appears:

> "Table du système de fichiers incorrecte" (File system map inconsistent.)

Solution

1. Disconnect USB devices that you're not using. Plug them in only after the computer has started up and when you need to use them.
2. Reset the computer's parameter memory (PRAM). See article 2238 "**Macintosh: How to Reset PRAM and NVRAM**" if you need help with this step.
3. Use the Extensions Manager control panel to disable libraries (bibliothèques) for application programs or USB devices that you don't use, or use infrequently. (You may need to turn them back on in order to use an application or USB device at a later time.)

Mac OS: Sound Preference Settings and Macintosh Manager Interaction

This article describes the steps necessary to define and retain sound preferences settings for Macintosh Manager clients using Mac OS 9.1 and earlier.
This article has been archived and is no longer updated by Apple.

Symptom

Sound Preferences cannot be forced or set up as initial preferences on Mac OS 9.1 and earlier.

Solution

The following steps describe how to define a set of Sound control panel settings (to mimic forcing sound preferences) for Macintosh Manager clients using Mac OS 9.1 and earlier:

1. Grant access to control panels to a workgroup containing at least one user. This option is located in the Macintosh Manager admin utility under Workgroups Tab:Privileges Tab:Apple Menu box.
2. On the Macintosh Manager admin computer, log in to the user's account with access to the control panels.
3. Make desired changes to the sound settings.
4. Log out of that user's account.
5. On the Macintosh Manager server, locate the user's Preferences folder. Inside this folder you will find the Sound Preferences file.
6. Click to select the file.
7. Choose Get Info from the File menu.
8. Click Locked to lock the file.
9. Copy this user's Sound Preferences file to all other user's Preferences folders who require these settings.
10. (Optional) In the Macintosh Manager Admin utility, under the Privileges tab, disable Control Panel Access. The Control Strip will also need to be disabled on each Macintosh Manager client. This would be used to further prevent user access to Sound control panel settings during the Macintosh Manager login process.

These settings remain intact when a user logs out and subsequently logs in with Mac OS 9.x clients:

- Alert Sound: Transfers OK across multiple logins as long as the selected alert sound is present in the client's System file.
- Alert Volume: Transfers OK across multiple logins and hardware.
- Main Volume: Transfers OK.
- Input Source: Transfers OK, provided hardware configuration exists. Because there is no built-in microphone on the Power Macintosh G3 (Blue and White) computer, for example, this setting will default to "No Selection" on this computer if "Built-in" was selected in an iMac computer's Sound control panel.
- Output Device: Transfers OK, provided the hardware configuration exists.
- Speakers: Transfers OK, provided the hardware configuration exists. This selection will be available if external speakers are detected. The right and left sound levels are not transferred properly over multiple logins.

Mac OS 9.1 preinstalled alert sounds include: ChuToy, Glass, Indigo, Laugh, Logjam, Pong2003, Purr, SimpleBeep, Single Click, Sosumi, Submarine, Temple, Uh oh, Voltage, and Whit.

Mac OS 8.6 and Earlier Macintosh Manager Client Sound Preference Behavior

The following steps describe how to define a desired set of Sound control panel settings (to mimic forcing sound preferences) for Macintosh Manager clients using Mac OS 8.6 and earlier versions of Mac OS.

The System Access settings will always remain intact unless the users are given access to the Sound control panel, Control Strip or any other utility capable of altering sound-related settings. Changes will be made to the client computer's sound settings and not the user's. The next user who logs in on that computer will see the previous user's settings if any changes were made.

If you wish to assign Monitors & Sounds settings en masse to Mac OS 8.6 users, a template of the desired Sound Preferences and Monitors & Sounds folder must be set up on a client and copied manually or via Network Assistant to the Preferences folder of each computer. (See Note 1). All settings transfer to the Mac OS 8.6 client computers except the Alert Sound selection.

If the you wish to retain sound settings on these Macintosh Manager clients, you must prevent access to the Monitors & Sound control panel, Control Strip and any other utility capable of altering sound settings.

Mac OS 8.6 preinstalled alert sounds include: Droplet, Indigo, Quack, Simple Beep, Sosumi, and Wild Eep.

Notes

1. Network Assistant 3.6.x client software is for use with Mac OS 8.1 through 8.6. Do not install Network Assistant 4.0.x client software with computers using Mac OS 8.1 through 8.6.

Firmware Update: Firmware Updates 4.1.7 and Later May Disable Out-of-Spec Third-Party RAM

This article describes why some third-party RAM (memory) may no longer be recognized by the computer after installing the 4.1.7, 4.1.8, or 4.1.9 firmware updates for iBook, PowerBook G3 and G4, Power Mac G4, Power Mac G4 Cube, and iMac.
This article has been archived and is no longer updated by Apple.
The Apple 4.1.7, 4.1.8, and 4.1.9 firmware updates incorporate a number of fixes that dramatically improve system stability and performance. The update also includes a check that validates whether the memory installed in the computer is compatible. This check was added to help alleviate random crashes and stability issues. This memory test disables memory DIMMs that are found to be out of specification, and DIMMs that cannot be determined to be compatible. As a result, some third-party memory that was recognized by previous versions of firmware may no longer be recognized after the updates.

With this set of firmware updates, Apple is strictly enforcing adherence to published RAM specifications. RAM that falls outside of specification can cause stability issues with Apple hardware and software, including Mac OS X. If out-of-spec RAM is installed in a Macintosh computer, the system cannot be expected to perform reliably. Apple has provided RAM specifications to memory developers for some time.

When purchasing RAM modules for use in Macintosh computers, make sure that they conform to the JEDEC specification. Check with your memory vendor to ensure that the RAM module supports the correct timing modes and that their Serial Presence Detect (SPD) feature has been programmed properly, as called out in the JEDEC specification.

If you have installed the 4.1.7, 4.1.8, or 4.1.9 firmware update on your computer and some of your third-party RAM is not recognized, contact the vendor of that RAM.

QuickTime 5: System Requirements

This article outlines the system requirements for QuickTime 5 on Windows and Mac OS.

This article has been archived and is no longer updated by Apple.

Mac OS System Requirements

- PowerPC-based computer
- 32 MB of memory (RAM) or more
- Mac OS 7.5.5 or later

Windows System Requirements

- QuickTime 5 is compatible with:
  - Windows 95
  - Windows 98
  - Windows 2000
  - Windows NT
  - Windows Me
- Intel Pentium or compatible microprocessor
- 32 MB RAM
- Sound Blaster or compatible sound card and speakers
- DirectX 3.0 or later

Apple Software Restore: How to Perform a Multiple Disc Restoration

This article explains how to use Apple Software Restore to reinstall the operating systems and application programs that came with your computer.

This article has been archived and is no longer updated by Apple.

Important: If your computer came with both Mac OS 9.1 and Mac OS X installed on the hard disk, you should follow the steps in this article. If your computer came with only Mac OS 9.1 or earlier installed on the hard disk, you should follow the steps outlined in article 24270: "**Apple Software Restore: How to Perform a Single Disc Restoration.**"

Warning: Apple Software Restore will completely erase the contents of your hard disk or disk partition. You should back up important files and documents that you want to keep before using Apple Software Restore.

Follow these steps to reinstall the operating systems and application programs that came with your computer:

1. Make sure you have made backup copies of files and documents you want to keep. You should save these copies to a removable medium (CD-RW disc, floppy disk, ZIP disk, and so forth), or to a file server or your iDisk.
2. Find the Restore CDs that came with your computer. There may be five or more.
3. Insert disc 1.
4. If your computer is using Mac OS 9.1, choose Restart from the Special menu to restart the computer. If your computer is using Mac OS X, choose Restart from the Apple menu.
5. Press and hold the C key until the "Welcome to Macintosh" message appears. (This key allows the computer to start up from the CD.)

Figure 1 Multiple disc Apple Software Restore

6. Select the disk or volume onto which you want to restore the software, then click Restore. This process could take 20 to 30 minutes.

Figure 2 When prompted by Apple Software restore, insert the next disk

7. When prompted, remove the disc from the drive, and insert the next one as indicated on the screen.
8. When this process is finished, restart your computer to use the new software.

How to Determine a CD or DVD Drive‘s Mechanism and Firmware Version

This document explains how to determine which mechanism is used in an external USB or FireWire CD or DVD drive, and what version of firmware that mechanism uses. This information can be useful in determining if the drive is compatible with iTunes.

This article has been archived and is no longer updated by Apple.

Follow these steps to determine a CD or DVD drive's mechanism and firmware version:

1. Connect the external CD or DVD drive to the computer.
2. Start up the computer.
3. Choose Apple System Profiler from the Apple menu (Mac OS 9), or open it from the Utilities folder (Applications/Utilities) in Mac OS X.
4. Click the Devices and Volumes tab.
5. Locate the listing for the optical drive in the USB or FireWire device tree.
6. Click the disclosure triangle to the left of the device listing to get more information about it.

Below is a screenshot of the information listed in Apple System Profiler for a FireWire optical drive.

Apple System Profiler information about an optical drive

1. Mechanism model
2. Firmware version
3. Mechanism vendor

Tip: In Mac OS 9, Apple System Profiler 2.5.8 or later is required. It is included in the Authoring Support Update 1.1. In Mac OS X, Apple System Profiler 2.7 or later is required.

Use the Software Update control panel to download and install the Authoring Support Update version 1.1. You can also download Authoring Support Update version 1.1 from Apple Downloads.

For the latest information about compatible CD-RW drives, visit the iTunes website.

Apple Studio Display 17 (LCD): Apple Displays Software Won‘t Install

If your computer has Mac OS X 10.0.4 or later, or Mac OS 9.2 or later, you do not need to install the Apple Displays software that comes with the Apple Studio Display 17 (LCD).

This article has been archived and is no longer updated by Apple.

Symptom

When you try to install the Apple Displays Software an alert box with this message appears:

"This software cannot be installed on this computer."

Solution

You do not need to install this software. It is already part of Mac OS X 10.0.4 and later, as well as part of Mac OS 9.2 and later.

You should install this software if your computer uses earlier versions of the Mac OS, although it is better to upgrade to a later version.

iBook: About the Video-Out Port

This article contains compatibility information for the video-out port on the iBook computer.

This article has been archived and is no longer updated by Apple.

Note: The computers are all white in color.

The iBook computer has a video (standard red/green/blue video) output port that allows you to connect an RGB video monitor to the computer. The computer detects when a monitor is plugged in and sets up the monitor accordingly.

You use the VGA Adapter included with your iBook computer to connect an external monitor to the computer's video-out port.

Figure 1 VGA Adapter

To connect a monitor to your iBook computer:

1. Choose Sleep from the Special menu.
2. Connect the monitor cable to the VGA Adapter.
3. Connect the VGA Adapter to the iBook computer's video-output port.
4. Press the computer's power button to wake it from sleep.

The monitor you connected to the computer operates in mirror mode, which means that you see the same image on the iBook's display as you see on the external monitor.

The iBook computer's video-out port can work with monitors that are compatible with these video resolutions:

- 640 by 480 pixels at 60 Hz
- 800 by 600 pixels at 75 Hz
- 1024 by 768 pixels at 75 Hz

Note: The video-out port and Apple VGA Adapter are compatible with most monitors that have a VGA-style connector. Many monitors have this connector. If you use an earlier Apple monitor that has a DB-15 connector, you may need to connect a Mac-to-VGA adapter, which you can purchase from an Apple reseller.

The iBook computer's video-out port works with RGB monitors that use the DDC (display data channel) standard for identification. Earlier monitors that do not use the DDC standard are not compatible, including the following Apple monitors:

- Multiple Scan 17
- Multiple Scan 20
- AudioVision 14
- Apple Hi-Res RGB
- Apple 16-inch Color
- Apple Hi-Res Monochrome
- Macintosh 12-inch RGB

Mac OS X 10.0: Managing AppleTalk Printers

Use the Apple Printer Utility to manage AppleTalk printers.
This article has been archived and is no longer updated by Apple.

Symptom

You are unable to change the name and manage the startup page of an AppleTalk printer in the Print Center.

Solution

Use the Apple Printer Utility to manage an AppleTalk printer in the Classic Environment or when started up with Mac OS 9.1.

Final Cut Pro: About Luminance

This article is about luminance and how Final Cut Pro handles black, white, and super-white levels.

This article has been archived and is no longer updated by Apple.

Measuring Black and White Levels

How Brightness is Measured

The way brightness (also referred to as luminance) is measured in analog video differs from the way it is measured digitally by Final Cut Pro's Waveform monitor. (The Waveform monitor uses the ITU (International Telecommunications Union) standard for digital video.)

Measuring Digital Video During Capture

When you use Final Cut Pro's Waveform monitor, black is always represented on a digital scale as 0 percent, and white is represented by 100 percent, regardless of the source.

Many consumer camcorders record super-white video levels, or video levels that exceed a digital value of 100 percent. Some record at up to 109 percent. Final Cut Pro is capable of capturing and maintaining these super-white levels through final output as long as the video codec you use to capture is compatible with YUV processing. The Apple DV codec included with QuickTime is compatible with YUV processing. It allows the seamless capture and processing of DV clips with super-white video levels. If you have a third-party capture card, check the documentation that came with it to find out if it is compatible with YUV processing.

If your video capture codec does not work with YUV processing, you may see an effect called luma clamping when Final Cut Pro renders clips with super-white luminance levels. When this occurs, clips with super-white luminance levels that have filters or transitions applied to them will have all portions of the signal from 101 to 109 percent clamped to 100 percent after rendering. Luma clamping appears as a slight darkening of the super-white areas in the picture. This effect is most noticeable when using a transition, such as a dissolve, between two clips. The super-white areas of the clip that is making the transition will appear to suddenly darken for the duration of the rendered transition.

Because the Apple DV codec is compatible with YUV processing, it preserves all super-white levels in both rendered and unrendered clips, eliminating luma clamping altogether.

Measuring Analog Video During Output

After you have captured and edited your video in Final Cut Pro, you may need to output it to tape. If you are outputting an analog signal (such as S-video or YUV) and you use a hardware Waveform monitor to measure the signal's brightness, it's measured in IRE (Institute of Radio Engineers) units. In professional analog video, 100 IRE represents absolute white. Absolute black, or Setup, is represented by 0 IRE for PAL, 0 IRE for NTSC in Japan, and 7.5 IRE for NTSC in the United States.

If you are outputting back to analog tape using the built-in FireWire interface of your Apple computer with a consumer DV device, the black level of your video may vary depending on the device you use. While the digital video signal output from FireWire always has a digital black value of 0 percent, some DV devices output analog black around 0 IRE, and others around 7.5 IRE, depending on the model. Professional video facilities are fairly stringent about keeping video levels at precisely 0-Setup for PAL and NTSC in Japan, and 7.5-Setup for NTSC in the United States, so you may need to use a hardware Proc Amp to adjust your analog video signal accordingly.

What is Setup?

Setup refers to the black level of an analog video signal. If you use a hardware Proc Amp to adjust an incoming or outgoing analog video signal, the Setup control will allow you to adjust the analog video signal's voltage level for black.

If you are outputting back to analog tape using a third-party analog video interface, you should check its manual to determine how to configure it for the U.S. (7.5-Setup) or the Japanese (0-Setup) NTSC standard. Most vendors of analog video I/O cards include a control panel that allows selection of which black level to use. Most vendors label this as "7.5 Setup" or "0 Setup". In some cases it ma be labeled "NTSC" or "NTSC-J".

If you are outputting back to digital tape as a digital signal (for example, "SDI", "601", or HD) using a third-party digital video interface, you do not need to worry about Setup levels because the digital values for black and white specified by the ITU are standardized worldwide. They are also the same as the digital values Final Cut Pro uses.

About the Super-White Tab

The options in this tab are available for codecs that work with YCrCb color space. To find out which codecs work this way, go to the Final Cut Pro Web site (http://www.apple.com/finalcutpro/).

Always Render in RGB
When this is checked, codecs that normally process color using the YUV (or YCrCb) color space are forced to process in RGB color space. Selecting this option may cause subtle changes in color in your rendered material. If the video capture codec you are using does not work with YUV rendering, this option is unavailable.

Use this option if you want to accomplish a specific compositing task, and you think color clamping in the RGB color space might give you a different desired result than using the straight YUV color space. For example, if you are using After Effects filters, which only process in RGB color space, with Final Cut Pro filters, which process in YUV color space, choosing this option ensures a consistent look.

Process maximum white as
Many DV camcorders record video with whites that are brighter than 100 IRE, the level allowed by the CCIR 601 engineering standard for video. White levels brighter than 100 IRE are called super-white.

When you use clips created in RGB color space (for example, imported graphics files, Final Cut Pro generator clips such as the Text Generator, or QuickTime movies that use codecs in RGB color space), Final Cut Pro sets the maximum whites values in these imported clips to the white level specified by this pop-up menu. In this way, you can make sure that the white levels of your graphics or generator clips will match those of your captured video.

This pop-up menu allows you to match RGB brightness to YUV (or YCrCb) clips using super-white. It is only available if 'Always Render in RGB' is not selected. It has two options:

- **White**
  If you choose this, the maximum brightness of imported graphics or generators using the RGB color space will be set to a digital level of 100 percent. If the exposure of your video was carefully controlled during your shoot and you are sure that the brightness of your imported video clips is no more than 100 IRE, you should use this setting. As a result, the brightest whites in your graphics or generators will be at 100 percent when viewed on Final Cut Pro's Waveform monitor. Using the White setting will result in the luminance of the graphics in your project being broadcast-legal, and is the recommended mode for video destined for on-air broadcast.
- **Super-White**
  If you choose this, the maximum brightness of imported graphics or generators using the RGB color space will be set to a digital level of 109 percent. This will allow you to match the super-white levels of clips from some DV camcorders with the maximum white levels of your graphics or generator clip. As a result, the brightest white in your graphics or generators will be mapped to 109 percent when viewed on Final Cut Pro's Waveform monitor. Using the super-white option can be important if you are trying to achieve a consistent look between RGB clips in your project and video clips with super-white levels.

  Important: While using the Super-White setting will match the super-white levels recorded by some consumer camcorders, the output will not be "broadcast legal" because the luminance levels will be too high according to the CCIR 601 broadcast definition for video. In this case, if you have to output a tape for broadcast, you will need to correct the white levels in your edited sequence either with filters, or by using external hardware such as a Proc Amp to adjust the levels of your video on output.

Mac OS X Server: How to Set Up Virtual Hosts

This documents describes how to set up virtual hosts in Mac OS X Server 10.0 through 10.2. Sometimes serving virtual hosts is referred to as a multi-domain feature. Name-based virtual hosts have been used since the HTTP 1.1 standard, and allow a server with a singe IP address to host multiple Web sites. IP-based virtual hosts work with the HTTP 1.0 standard and allow a server with multiple IP addresses to serve a Web site for each IP.

This article has been archived and is no longer updated by Apple.

To set up virtual hosts

1. Log in to Server Admin (on Mac OS X Server 10.0-10.1) or Server Settings (on Mac OS X Server 10.2).
2. Click the Internet Tab.
3. Click Web.
4. Select 'Configure Web Service.'
5. In the Configure Web Service area, click Sites.
6. Click Add.
7. Set up a site for each virtual host. To configure name-based virtual hosts, be sure to enter the same IP address for each virtual host. To configure IP-based virtual hosts, enter the correct IP for each domain.

In order to serve a domain as well as host in that domain, you need to configure each as a separate name-based virtual host. For example, if you are setting up www.example.com and you want visitors entering example.com to get to your Web site, you must:

- make sure that DNS is correctly configured to allow this.
- enter example.com and www.example.com as two separate name-based virtual hosts configured the same except for their names.

Macintosh Manager 2: "AFP User log-in" Error

Restarting a server computer with Mac OS X Server 10.0 on 2001-06-22 or later prevents the Macintosh Manager Admin application from connecting to the server.
This article has been archived and is no longer updated by Apple.

Symptom

An alert box with this message appears when connecting with Macintosh Manager Admin:

> "Unable to open databases on "server name" because of an error. The AFP user log-in information is incorrect."

Figure 1 Macintosh Manager Admin alert box

Solution

This symptom is caused when a server computer is restarted on 2001-06-22 or a later date. To resolve this issue:

1. Install the Mac OS X 10.0.4 Update.
2. Install the Mac OS X 10.0.4 Server Update.

   Note: When using the automatic Software Update feature of System Preferences, the Mac OS X 10.0.4 Server Update does not appear until the Mac OS X 10.0.4 Update has been installed.

3. Install the Macintosh Manager 2.0.2 Update. Be sure to follow instructions included the Macintosh Manager 2.0.2 Update.

Published Date: Feb 19, 2012

Mac OS X 10.0: How to Download Developer Tools

Mac OS X 10.0 Developer Tools are available for download from the Apple Developer Connection Web site.
This article has been archived and is no longer updated by Apple.

To download the Mac OS X 10.0 Developer Tools:

1. Go to http://developer.apple.com/ .
2. Click the Join Now link in the Partner with Apple section and follow the instructions to join Apple Developer Connection.
3. Once your Apple Developer Membership is confirmed, log in and click the Download Software link.

The Mac OS X 10.0 Developer Tools are available for download there.

iBook (Dual USB): Computer Doesn‘t Respond After Screen Dims

An iBook (Dual USB) computer with Mac OS X may stop responding after the display dims, or the computer is put to sleep.

This article has been archived and is no longer updated by Apple.

Symptom

The computer stops responding if the display dims after a period of time, or in some cases if you put it to sleep. The only way to get the computer to respond is to restart it. You notice that this happens if the Classic environment is open when the screen dims or when the computer is put to sleep.

Solution

Download and install Mac OS X 10.0.4:

1. Connect to the Internet.
2. Choose System Preferences from the Apple menu.
3. Click Software Update.
4. Click Update Now. The computer will check for available updates.
5. Make sure Mac OS X 10.0.4 is selected and click Install. The computer will download and install the update.

The update is also available from Apple Software Updates (http://www.apple.com/swupdates/).

QuickTime Streaming Server: "Unable to establish a secure connection to ‘server.domain.com‘" Alert

This article describes the cause and solution for the "Unable to establish a secure connection to 'server.domain.com'" alert.
This article has been archived and is no longer updated by Apple.

Symptom

An alert appears with this message when you click on the Streaming Server Admin icon in the Dock:

> "Unable to establish a secure connection to 'server.domain.com'."

Solution

Your Web browser is reacting to the presence of SSL. SSL is the Secure Sockets Layer protocol. It was designed to provide additional security for electronic transactions, and QuickTime Streaming Server was written to take advantage of SSL. Because SSL requires that you obtain a valid server-side individual certificate, your browser is warning you that it cannot determine if your default certificate is valid. The default certificate installed by QTSS is simply a sample certificate.

For more information on what SSL is and how to use it, see "Providing Secure Transactions" on page 122 of the Mac OS X Server Administrator's Guide.

If you do not have a valid certificate of your own at this time and wish to disable SSL for the Streaming Server Admin, you can do so by using the following procedure:

1. Login to Mac OS X as an admin user.
2. Choose Go To Folder from the Go menu in the Finder.
3. Type in "/Library/QuicktimeStreamingServer/Config/" and click Go.
Note: For for versions of QuickTime Streaming Server prior to 4, you would type "/private/etc/streaming/".
4. Double-click the file "streamingadminserver.conf" and choose a text editor, such as TextEdit, that can open the file. **Note:** This file is created when you log in to the Streaming Server Admin program (using a Web browser) and make a configuration change.
5. Add the following information to the file:

   ssl=0

   Note: If the line "ssl=1" already exists, edit it to read "ssl=0" rather than adding a new line.

6. Save the changes, and click Overwrite when prompted. Make sure you save the file as plain text (not RTF).
7. Restart the server. SSL will be disabled.

If you have an SSL certificate that you would like the Streaming Admin Server to use, then you need to copy and paste your certificate into the /private/etc/streaming/streamingadminserver.pem file, and make sure that the /private/etc/streaming/streamingadminserver.conf file does not contain ssl=0.

Network Assistant 4.0.x: Troubleshooting by Forcing a Connection Using AppleTalk or TCP/IP

When troubleshooting Network Assistant issues, it is helpful to know if the issues occur when connecting to clients using AppleTalk, TCP/IP, or both. This article discusses how to force Network Assistant to the use a single network protocol.

This article has been archived and is no longer updated by Apple.

The Network Assistant can connect to clients using two networking protocols: AppleTalk and TCP/IP. When adding client computers to your workstation list, the protocol you select with "Find using:" is the default protocol used to communicate with that client.

When troubleshooting issues in Network Assistant, it is good to know if the issue is due to the use of a particular network protocol. To force Network Assistant to use a signal protocol, use the following steps:

1. Open the Network Assistant application while pressing the Control key.

Note: If you are using Network Assistant Admin on a computer with Mac OS 8.5 and later, you will see a contextual menu if you click while pressing Control. In such situations, select Open from the contextual menu.

2. Listen for a system beep when the Network Assistant application opens, just before the password prompt appears. The system beep is your confirmation that the Network Assistant will now force the network connection protocol used to find each workstation.

3. Release the Control key, enter your password, and click OK.

For this entire session in Network Assistant Admin, the clients will be forced to use the protocol that was used to assign the workstation.

It may be necessary to remove workstations and add them again, using the other protocol to test issues.

Both Network Assistant Admin 3.x and 4.x have this feature.

Published Date: Oct 7, 2016

Macintosh Manager 2: Logging in As a Mac OS X Server Admin User

A Mac OS X Server Admin user is unable to connect to (mount) her Home directory when logging in to a Macintosh Manager client.
This article has been archived and is no longer updated by Apple.

Symptom

When a Mac OS X Server Admin user logs in to a Macintosh Manager client, an AppleShare connection dialog appears. The user can authenticate or cancel. In either case, an alert box with one of these messages appears (Figures 1 and 2):

> "Your documents can't be accessed at this time. (User canceled AFP server login.)"
>
> "You may work offline--documents you save while offline will be moved to your documents folder when the server comes back. Do you want to continue?"
>
> "Your documents can't be accessed at this time. (Access to the server was denied.)"
>
> "You may work offline--documents you save while offline will be moved to your documents folder when the server comes back. Do you want to continue?"

Figure 1 "User canceled AFP server login"

Figure 2 "Access to the server was denied"

Solution

1. Create another user that is not an Admin user for Mac OS X Server.
2. Log in with that user.

This means that the person who logs in as this user will have multiple home directories, one for the original Admin user account, and one for the new non-Admin user account.

Apple System Profiler: How to Find a Computer‘s Serial Number

This document explains how to find a computer's serial using Apple System Profiler.

This article has been archived and is no longer updated by Apple.

To find a computer's serial number with Apple System Profiler 3.0 or later:

1. Open Apple System Profiler.
2. Click the System Profile tab, if you don't already see it.
3. Click the disclosure triangle next to "Hardware overview" to reveal the computer's serial number. See Figure 1.

Figure 1 Apple System Profiler 3.0 window

To find a computer's serial number with Apple System Profiler 2.6.1:

1. Open Apple System Profiler.
2. Click the System Profile tab, if you don't already see it.

The computer's serial number is located directly below the System Profile and Devices and Volumes tabs. See Figure 2.

Figure 2 Apple System Profiler 2.6.1 window

To find a computer's serial number with Apple System Profiler 2.6 or earlier:

1. Open Apple System Profiler.
2. Click the System Profile tab, if you don't already see it.
3. Click the disclosure triangle next to "Production information" to reveal the computer's serial number. See Figure 3.

Figure 3 Apple System Profiler 2.6 window

Apple DVD Player 2.7: "Apple DVD Player cannot find software it needs" Alert

ATI Resource Manager 2.7.3 must be installed for Apple DVD Player 2.7 to work.
This article has been archived and is no longer updated by Apple.

Symptom

When you open Apple DVD Player, an alert box with this message appears:

> "Apple DVD Player cannot find software it needs. Try reinstalling Apple DVD Player. (201)."

Figure 1 Apple DVD Player 2.7 alert box

Reinstalling the Apple DVD Player software does not resolve the issue.

Solution

Reinstall ATI Resource Manager 2.7.3 by

- installing the Mac OS 9.1 Update
- custom installing ATI Graphics if you have the Mac OS 9.1 Install CD

Note: The ATI Resource Manager must be present in the Extensions Folder for the Mac OS 9.1 Installer to update it.

QuickTime: Broken Plug-In Icon With Internet Explorer 5.5 SP2 and later for Windows

This document explains a broken plug-in icon issue which may occur with Microsoft Internet Explorer version 5.5 SP2 and 6.0 for Windows
This article has been archived and is no longer updated by Apple.

Symptom

Windows users who try to play a QuickTime movie in Internet Explorer version 5.5 SP2 or later see a "broken plug-in icon".

Users of other browsers on either Windows or Mac OS are unaffected; they can continue to use the plug-in installed with QuickTime.

Solution

To restore compatibility, Apple has provided an ActiveX control in the QuickTIme 5.0.5 and later. The latest version of QuickTime is available at http://www.apple.com/quicktime/. Once you have the new ActiveX control installed, you are unaffected by this issue; you can also view existing Web pages with QuickTime movies.

Web Content Developers

When authoring Web pages, you can prevent this issue by authoring your HTML to check if the required ActiveX control is installed wherever you have QuickTime content embedded. This HTML change will result in Web pages compatible with Netscape and Internet Explorer browsers on both Mac and Windows computers (see below for more information).

The required code consists of an HTML OBJECT element with an enclosed EMBED element as in the following example:

```
<OBJECT CLASSID="clsid:02BF25D5-8C17-4B23-BC80-D3488ABDDC6B" WIDTH="160"HEIGHT="144"
CODEBASE="http://www.apple.com/qtactivex/qtplugin.cab">
<PARAM name="SRC" VALUE="sample.mov">
<PARAM name="AUTOPLAY" VALUE="true">
<PARAM name="CONTROLLER" VALUE="false">
<EMBED SRC="sample.mov" WIDTH="160" HEIGHT="144" AUTOPLAY="true" CONTROLLER="false"
PLUGINSPAGE="http://www.apple.com/quicktime/download/">
</EMBED>
</OBJECT>
```

CLASSID must always equal: clsid:02BF25D5-8C17-4B23-BC80-D3488ABDDC6B
CODEBASE must always equal: http://www.apple.com/qtactivex/qtplugin.cab
PLUGINSPAGE must always equal: http://www.apple.com/quicktime/download/

The other attributes should be customized to your Web page. You need to substitute "sample.mov" (in both SRC attribute elements) with the URL of the actual movie to be played. You should also change the HEIGHT and WIDTH parameters to match the height and width of the movie (in pixels).

If you already have EMBED elements for the QuickTime plug-in on the relevant pages, you need to enclose each of them in an OBJECT element with CLASSID and CODEBASE parameter values as shown above and with SRC and other parameter values to match those in your existing EMBED element. The OBJECT element can use any EMBED attributes QuickTime understands. Go here for more information.

For existing Web pages, it may be sufficient to add such an OBJECT element to the "front door" page of your site. Once the OBJECT element on the "front door" page has caused the user to install the ActiveX control, all subsequent pages with the original EMBED elements will work properly. In cases where you cannot be certain that the "front door" page is always visited, then all your pages should be revised to use these OBJECT elements.

Background

QuickTime uses a plug-in mechanism to display movies from your Web page in the user's browser. Before, you would use an EMBED element alone to display QuickTime content within the browser, much like in the example below:

```
<EMBED src="sample.mov" width="160" height="144" autoplay="true" CONTROLLER="false"
PLUGINSPAGE="http://www.apple.com/quicktime/download/"></EMBED>
```

For this mechanism to work, the user must have the QuickTime plug-in installed on his or her system. If the appropriate QuickTime plug-in is not installed, when your HTML page with QuickTime content is loaded into the user's browser, the movie is not visible. Instead, the browser replaces

it with a "broken plug-in icon" and attempts to assist the user in obtaining the required software. An unfortunate side effect of this approach is that the user is directed away from your site and is distracted by the installation process.

How it works

The OBJECT element is used by Internet Explorer on Windows 9x/NT/2000/XP platforms and by other browsers that support the QuickTime ActiveX control. The enclosed EMBED element is used by Netscape browsers, Internet Explorer for the Mac, and other browsers that support the "Netscape style" QuickTime plug-in. Browsers that understand the OBJECT element ignore the EMBED element; those that don't understand the OBJECT element use the EMBED element.

Within the OBJECT element, the CLASSID parameter uniquely identifies which ActiveX control to use. A CLASSID parameter with the value "clsid:02BF25D5-8C17-4B23-BC80-D3488ABDDC6B" tells Internet Explorer to use the QuickTime ActiveX control. (You must use exactly this value; it is the only value that identifies the QuickTime ActiveX control). If the user does not already have the ActiveX control installed on his or her system, the CODEBASE parameter tells the browser where to find it for downloading. Internet Explorer will automatically offer to download and install the ActiveX control for the user, after which the movie can be played without restarting the browser, or, if QuickTime is not already installed, will prompt the user to download and install QuickTime. You must always use "http://www.apple.com/qtactivex/qtplugin.cab" for the CODEBASE URL. This URL will always have the latest version of the QuickTime ActiveX control.

Because a browser will use either the OBJECT element or the EMBED element, but not both, most of the element attributes must be included in each. Note that in the example above the EMBED element has autoplay="true" and the OBJECT element has <param name="autoplay" value="true">, so the movie will begin to play automatically whether it is loaded with the QuickTime ActiveX control or the QuickTime plug-in. The only attributes that should not be duplicated are CLASSID, CODEBASE, and PLUGINSPAGE. CLASSID and CODEBASE are specific to the OBJECT element. PLUGINSPAGE is specific to the EMBED element.

Although Windows Internet Explorer 5.5 SP2 and 6.0 will no longer use the QuickTime plug-in, once the QuickTime ActiveX control has been installed on a user's system, these versions of Internet Explorer will use the installed ActiveX control to satisfy a properly coded EMBED element.

Mac OS 9: Update Does Not Install, "cannot read file in.img or help.img" Alert Boxes Appear

During an upgrade installation of Mac OS 9, an alert box appears with a message that installation cannot continue because the installer cannot read one or more .img files.

This article has been archived and is no longer updated by Apple.

Symptom

While installing a Mac OS 9 update over an existing System Folder, an alert box appears with one of the following messages:

- "cannot read file in.img"
- "cannot read file help.img"

Solution

Note: A disk image **volume** has an icon that looks like a disk and a filename without any extensions. It behaves like a disk. A disk image **file** has an icon that looks like a file (a paper with a dog-eared corner) and a filename extension of ".smi" or ".img".

1. Drag the icon of the updater disk image volume to the Trash. **Important:** This icon's filename does not have an extension such as ".smi" or ".img".
2. Double-click the disk image file of the Mac OS 9 update icon whose filename has a ".smi" or ".img" extension. A new disk image volume icon appears on the desktop.
3. Open the disk image volume, and install the update.

For additional information on this issue, consult the "ShrinkWrap or ShrinkWrap engine reports an error" section of technical document 75098 "**Software Downloads: Software Format and Assistance**".

Apple Studio Display 17: Only 640 by 480 Resolution Is Available

Apple Studio Display 17 monitors may only show a 640 by 480 resolution, even though the computer's video card and the display are capable of higher resolutions.

This article has been archived and is no longer updated by Apple.

Symptom

When you turn on the computer, the display defaults to a 640 by 480 resolution. No other resolutions are available in the Monitors control panel. Resetting the computer's PRAM or dragging the Display preferences file to the Trash temporarily restores all resolutions, but the issue recurs when you restart the computer.

Solution

1. Make sure your computer is using Mac OS 9.2 or later. If not, download and install the Mac OS 9.2.1 Update or later. Once Mac OS 9.2 or later is installed, continue with the next steps.
2. Press the display's power button to turn it off.
3. Unplug the display's power cord.
4. Plug in the display's power cord.
5. Turn on the display.

If you cannot upgrade to Mac OS 9.2 or later, you can restore the resolutions by turning off the display data channel (DDC) feature. Follow these steps:

1. Press the On-Screen Display (OSD) Enter button located on the left side of the display. The Basic Adjustments menu appears.
2. Use the left or right arrow buttons to select the ETC icon.
3. Press the Enter button. The choices On or Off appear.
4. Use the left or right arrow buttons to select the Off icon.
5. Press the Exit button to leave the OSD.

The DDC feature is now turned off and the resolutions should appear in the Monitors control panel.

DVD Studio Pro, Apple DVD Player: Built-In DVD Drives Required for DVD-Video Preview and Playback

Learn about the requirements for previewing a disc with DVD Studio Pro.

This article has been archived and is no longer updated by Apple.

DVD Studio Pro 1.x requires an Apple-shipped internal DVD-ROM or DVD-R drive in order to use the Preview mode, or to test built projects using the Apple DVD Player application. These features will not work with Macintosh computers containing built-in CD-RW drives.

DVD Studio Pro 2 can Preview projects without a DVD drive. DVD Studio Pro final output is limited to the following:

- DVD-R using Apple DVD-R SuperDrive or Pioneer DVR-S201 recorder
- DLT tape (required for DVD-9 projects)
- Disk Image

The Apple DVD Player application requires an internal Apple DVD drive, regardless of whether you have DVD Studio Pro installed.

DVD Studio Pro and iDVD: Some Philips ProDVD Players Cannot Read DVD-R General Media Discs

Some Philips ProDVD players can not read DVD-R General Media discs.
This article has been archived and is no longer updated by Apple.
Certain Philips ProDVD players, such as the ProDVD 170, cannot play DVD-R General Media discs. DVD-R General Media is the type of media used by the SuperDrive, which comes with some Macintosh computers. The Philips ProDVD can play DVD-R Authoring Media. Apple's SuperDrive does not write to DVD-R Authoring media, although it is possible to use DVD Studio Pro with an external third-party DVD-R drive, which can write DVD-R Authoring Media.

DVD Player 3.0: Does Not Work With External Monitor Connected to PowerBook

DVD Player 3.0, included with Mac OS X 10.1, does not work with external monitors or televisions connected to PowerBook computers.

This article has been archived and is no longer updated by Apple.

Symptom

When you open DVD Player 3.0 after an external monitor or TV has been connected an alert box with this message appears:

> "This machine configuration is not supported."

When you open DVD Player 3.0 before an external monitor or TV is connected, you can hear the movie, but no see no video when it is played.

Solution

1. Make sure the computer is not in video mirroring mode, which is incompatible with DVD Player 3.0. You can turn off video mirroring in the Displays pane of System Preferences.
2. Download and install Mac OS X 10.1.3 or later. It is available using the Software Update pane of System Preferences, or from Apple Software Downloads (http://www.apple.com/swupdates/).

DVD Player 3.0: "DVDManager Fatal Error -36" Alert Appears When Computer Wakes From Sleep

This article explains an intermittent problem where DVD Player 3.0 displays the message "DVDManager Fatal Error -36" after the computer wakes from sleep.
This article has been archived and is no longer updated by Apple.

Symptom

When you wake the computer from sleep, a movie that was playing before the computer when into sleep mode plays for a few seconds and an alert with this message appears:

> "DVDManager Fatal Error -36"

Solution

Download and install DVD Player 3.0.1 or later from Apple Software Downloads (http://www.apple.com/swupdates/).

DVD Player 3.0: iBook Stops Responding When AV Cable Is Unplugged

An iBook (Dual USB) computer running Mac OS X 10.1 will stop responding if you unplug the AV cable while watching a movie on a DVD-Video disc with DVD Player 3.0.

This article has been archived and is no longer updated by Apple.

Symptom

If you unplug the iBook AV cable while playing a movie on a DVD-Video disc, the pointer turns into a spinning disc and the computer stops responding.

Solution

Restart the iBook computer by pressing Command-Control-power. The computer restarts. Other applications that were open will quit without saving changes to open documents or files.

Mac OS X 10.1: Lexmark Z22/32 Series, Z53 Drivers Not Included

The Lexmark Z22/32 Series and Z53 printer drivers are not included with Mac OS 10.1. They are available from Lexmark's Web site.
This article has been archived and is no longer updated by Apple.

Symptom

When you print from a Mac OS X application, shortly after Print Center opens and displays the status of the print job, a message appears that says the printer connection is closing. An alert message may also appear. The printer doesn't print anything.

Solution

1. Download and install the current driver for your printer from Lexmark's Web site (http://www.lexmark.com).
2. On the Install Ink Cartridge screen, you **must** click Edit and then select your cartridges. **This step is not optional.**

Hard Drive: Fluid Dynamic Bearing (FDB)

This document discusses the Fluid Dynamic Bearing (FDB) motor feature of hard drives used in Apple products.

This article has been archived and is no longer updated by Apple.

Hard drive manufacturers have used a ball bearing spindle motors for many years. However, an innovative motor design, called Fluid Dynamic Bearings (FDB), which is not based on ball bearings, eliminates metal to metal contact. This improves acoustics, reduces vibration, lengthens the drive's useful life, and increases its shock resistance. Hard drives used in certain Apple products take advantage of this motor feature.

iPod no longer plays music after formatting or partitioning the hard disk

This article has been archived and is no longer updated by Apple.

You should not partition, format, or change the formatting of iPod's hard disk using Disk Utility, Windows Explorer or other utility unless you are performing troubleshooting steps that require this step.

iPod, iPod mini, and iPod shuffle cannot play music if you format or partition the hard disk.

iPod only works (as a music player) when its hard disk is formatted for the appropriate platform using the Mac OS Extended (HFS Plus) or FAT32 formats. Do not reformat the disk using Mac OS Standard (HFS), New Technology File System (NTFS), or UNIX File System (UFS) formats.

Whether you use a Mac or Windows, iPod shuffle only works (as a music player) when its disk partition is formatted as FAT32 format.

If iPod's hard drive was partitioned, formatted, or the format was changed, use the latest version of the iPod Updater application to restore iPod iPod back to its factory condition.

Warning: The restore process cannot be undone. All of your songs and files will be deleted. Always make a backup of your important data.

Published Date: Oct 7, 2016

iTunes: Importing Songs Whose Artist‘s Name Begins With a Dot

When you import a song from an audio CD an artist's name that begins with a dot "." is changed to an underscore "_".
This article has been archived and is no longer updated by Apple.

Symptom

When you insert an audio CD iTunes gets the CD track names from the CDDB, but when you import a song from the CD an artist's name that begins with a dot "." is changed to an underscore "_".

Solution

This is the way iTunes works on Mac OS X. Artist's names that start with dot "." will be changed to begin with an underscore "_" when you import them from an audio CD.

iPod: Can become warm under normal usage

iPod can become warm under normal usage.
This article has been archived and is no longer updated by Apple.

iPod and iPod shuffle have many electronic parts that can become warm under normal usage, particularly the hard drive, flash memory, and the battery. When these parts become warm, iPod's exterior may also become warm to the touch. This is normal.

iPod may become warm to the touch when:

- charging the battery.
- updating the music library with iTunes.
- used as an external FireWire hard drive.

iPod will cool down when it is no longer in use.

iPod: Noise in Silent Passages

Under certain circumstances, you may hear a high-pitched noise in a song's silent passages.
This article has been archived and is no longer updated by Apple.

Symptom

You may hear a high-pitched noise during a song's silent passages. This only occurs with MP3 files and is most noticeable when the volume is set higher than 75 percent.

Note: Most people are not able to hear this sound. iPod itself is functioning normally.

Solution

Update iPod to iPod software 1.1 or later. The updater is available from Apple Software Downloads (http://www.apple.com/swupdates/).

Lowering the volume may minimize the noise with MP3 files.

AIFF and WAV files are not affected since they do not use the MP3 decoder.
Published Date: Oct 7, 2016

iPod: May Make Noise When Shaken

If shaken, iPod's Hold switch and hard drive may make some noises.
This article has been archived and is no longer updated by Apple.

Symptom

If you shake iPod, the Hold switch and hard drive make a rattling noise.

Solution

iPod is well constructed, but if you shake it you may hear some rattling noises that come from the Hold switch and the hard drive. This is not unusual, however, you should not needlessly or carelessly shake it.

If iPod does not work and you hear a rattling noise, follow the troubleshooting steps in technical document 60942: "**iPod: Does Not Turn On**."
Published Date: Oct 7, 2016

How to put iPod to sleep

Put iPod to sleep when you're not using it.
This article has been archived and is no longer updated by Apple.
To sleep iPod, press and hold the Play/Pause button until the iPod screen turns off. Press any button to turn iPod on. If you have an iPod shuffle, slide the switch on the back to the Off position.

To keep iPod from accidentally waking from sleep, slide the Hold switch toward the headphones port. For more information on the Hold switch see "**iPod: About the Hold Switch**."

For more information about sleep see "**iPod: About Sleep**."

DVD Player 3.0.1 and Later: Compatible Computers

This document lists the computers that are compatible with DVD Player 3.0.1 and later.
This article has been archived and is no longer updated by Apple.
Your computer should have these characteristics to use DVD Player 3.0.1 or later:

Software

- Mac OS X 10.1 or later

Hardware

A built-in DVD drive and built-in FireWire port(s) are required. This includes the following computers:

- iBook
- iMac
- PowerBook (FireWire)
- PowerBook G4
- Power Mac G3 (Blue and White)
- Power Mac G4 Cube
- Power Mac G4

If you have a Mac OS X computer with a built-in DVD drive that is not on this list, you can view DVD-Video discs by starting up the computer using Mac OS 9.

Note: Not all of the above computers came with built-in DVD-ROM drives. Adding an external DVD-ROM drive will not enable DVD Player to be installed or to function. See technical document 42727 "**Apple DVD Player: Requires an Internal DVD Drive**" for additional information. PowerBook (FireWire) users should also review technical document 106479 "**Mac OS X 10.1: DVD Player Not Installed on PowerBook (FireWire) Computer**."

Earlier PowerBook computers

DVD Player 3.0.1 and later do not work with PowerBook computers that do not have built-in FireWire ports. Based on the combined performance of microprocessor, memory, and bus speed, and on-graphics architecture, Apple was able to add Power Macintosh G3 (Blue and White) and Power Mac G4 (PCI Graphics) computers to the list of computers that work with DVD Player 3.0.1 or later.

Apple does not plan to update DVD Player 3 to work with earlier PowerBook computers.

AppleShare IP 6.3: Mac OS Server Admin - Alert When Assigning Privileges

An alert message may appear when you choose Set Privileges from the Privileges menu in Mac OS Server Admin.

This article has been archived and is no longer updated by Apple.

Symptom

An alert box with one of these messages appears:

"OpenTransport error -3155"
"Unexpectedly quit, error type 2."
"Unexpectedly quit, error type 12."

Solution

Download and install Mac OS 9.2.2 Update, which includes AppleShare Client 3.9.2.

Published Date: Feb 19, 2012

FireWire: Frequently Asked Questions

This document contains frequently asked questions (FAQ) regarding FireWire, with answers to those questions.

This article has been archived and is no longer updated by Apple.

Questions answered in this document:

1. What is FireWire?
2. What is the data transfer speed?
3. Does FireWire have "plug-and-play" capability?
4. What is FireWire Target Disk Mode?
5. How many FireWire devices can be connected at any one time?
6. Does a FireWire device need to be turned on, before it is connected to the FireWire port?
7. Can FireWire devices be connected in a daisy chain?
8. What is i.LINK?

Question 1: What is FireWire?

Answer: FireWire, also known as IEEE 1394, is one of the fastest peripheral standards ever developed. It was developed by Apple in the 1990s and has been included with Macintosh computers beginning with the Power Macintosh G3 (Blue and White) model. FireWire has been widely adopted as a standard by digital peripheral companies such as Sony, Canon, JVC and Kodak. Specifications for FireWire ports used in Apple products can be found in technical document 58207: "**FireWire Ports: Specifications**."

Question 2: What is the data transfer speed?

Answer: FireWire can transfer data at up to 400 Mbps. FireWire 800 can transfer data at up to 800 Mbps.

Question 3: Does FireWire have "plug-and-play" capability?

Answer: Yes, if the FireWire device is designed according to the FireWire standard, the device can be connected and disconnected, while both the device and the Macintosh are turned on.

Question 4: What is FireWire Target Disk Mode?

Answer: FireWire Target Disk Mode allows a Macintosh computer with a FireWire port (the target computer) to be used as an external hard disk connected to another computer (the host). See technical document 58583 :"**Macintosh: How to Use FireWire Target Disk Mode**" for further information.

Question 5: How many FireWire devices can be connected at any one time?

Answer: Fire Wire can work with up to 63 devices on a bus. The number of bus-powered devices you can connect depends on the amount of power available from the computer, and the amount of power required by each device.

Question 6: Does a FireWire device need to be turned on, before it is connected to the FireWire port?

Answer: If the device is designed according to the FireWire standard, then it does not need to be turned on before it is connected to the computer. The computer can tell the difference between a device that is connected and not turned on, and a device that is connected and turned on. In practice, though, most devices profit from being turned on at the time they are connected.

Question 7: Can FireWire devices be connected in a daisy chain?

Answer: Yes, and if the devices are designed according to the FireWire standard, they can be turned on and off as needed. For example, all devices don't need to be powered on to use the last device in the chain. For the best result, and to avoid overstressing the FireWire port, connect one FireWire device to the Macintosh, then add one device at a time to the chain. Avoid plugging in live power adapters into devices connected to the chain.

Question 8: What is i.LINK?

Answer: i.LINK is Sony's name for FireWire.

Final Cut Pro 3: FireWire Output Disabled While Voice Over Set to DV Audio Input

The Voice Over audio input source cannot be set to DV Audio while external video is output through FireWire. Before DV Audio input can be used with the Voice Over tool, External Video (available from the View menu) must be set to off.

This article has been archived and is no longer updated by Apple.

Symptom

- An alert box with this message appears: "No sound recording devices are available" when you select the Voice Over tool.
- DV Audio is not an available audio source selection when the Voice Over tool is open.

Solution

Turn External Video off from the View menu before recording audio from a DV source using the Voice Over tool.

Final Cut Pro 3: "Codec Not Found" Alert When Importing Grayscale JPEG

An alert box with this message may appear: "Codec not found. You may be using compression type without corresponding hardware card" when you render grayscale NTSC Photo JPEG video or a grayscale JPEG graphic into an NTSC DV sequence.

This article has been archived and is no longer updated by Apple.

Symptom

An alert box with this message appears:

> "Codec not found. You may be using compression type without corresponding hardware card."

Solution

Install QuickTime 6.0 or later.

Final Cut Pro 3.0: Before You Upgrade

This document contains system requirements and things to do before you upgrade the application. It also includes information on new features, how to access late-breaking news, where to start, and using the tutorials. For the latest information on product updates, tips and techniques, third-party software, and qualified third-party devices, visit the Final Cut Pro Web site (http://www.apple.com/finalcutpro/).

This article has been archived and is no longer updated by Apple.

Before You Upgrade to Final Cut Pro 3.0

System requirements

You'll need the following hardware, software, and video equipment for Final Cut Pro:

Hardware and video equipment

- Power Macintosh G3/300 MHz or faster with built-in FireWire
- PowerBook G3/400 MHz or faster with built-in FireWire
- iMac 350 MHz or faster with built-in FireWire
- iBook (Dual USB) 500 MHz or faster with built-in FireWire
- A CD or DVD drive
- 256 MB random access memory (RAM) (384 MB or greater required for G4 real-time editing)
- A 6 GB, Audio/Video rated hard disk drive (20 GB or greater recommended)
- Dual-monitor support (optional)
- A Final Cut Pro-qualified video capture card for capturing video from an external source or exporting video to tape (optional)
- The correct FireWire or device control cable and any additional cables you may need for connecting your deck or camcorder to your computer
- A DV (digital video) source, such as a camcorder or deck, connected to your computer via a FireWire port (FireWire is also referred to as IEEE 1394 or Sony i.LINK.)
- An analog video source, a Final Cut Pro-qualified video capture card or device, and an adapter cable to connect the video source to your computer

Note: G4 real-time editing requires a single or dual-processor Power Macintosh G4 500 MHz or faster, or a PowerBook G4 667 MHz or faster. For more information about G4 real-time editing, see the Final Cut Pro Web site (http://www.apple.com/finalcutpro/).

Software

- Mac OS 9.2.2 or Mac OS X 10.1.1 or later
- QuickTime 5.0.4 or later

Before you upgrade Final Cut Pro

Important: The French, German, and Japanese versions of Final Cut Pro are only supported on a matching localized French, German, or Japanese version of the Mac OS. Multiple localized versions of Final Cut Pro from different countries on a single system are not supported. For example, if your computer has the French version of the Mac OS installed on it, you cannot install both the French and German versions of Final Cut Pro. For more information, see the Final Cut Pro Web site (http://www.apple.com/finalcutpro/).

Make sure you do the following before you install the software:

- Turn off any virus protection and security software that you may have installed on your computer.
- Upgrade to Mac OS 9.2.2 or later
  Final Cut Pro for Mac OS 9 requires you to upgrade to Mac OS 9.2.2 which is included on the Final Cut Pro CD. If you don't have Mac OS 9, you need to install it on your computer before you can upgrade to Mac OS 9.2.2.
- Upgrade to Mac OS X 10.1.1 or later
  Final Cut Pro for Mac OS X requires that you upgrade to Mac OS X 10.1.1. This requires you to first upgrade to Mac OS X 10.1, then use the Software Update pane of the System Preferences to install the latest Mac OS X updates.
- Install QuickTime 5.0.4 and unlock QuickTime Pro
  QuickTime 5.0.4 for Mac OS 9 and Mac OS X is included on the Final Cut Pro CD. See the document Final Cut Pro and QuickTime Pro Registration Numbers that came with Final Cut Pro for instructions on installing this software. To unlock QuickTime Pro, you need the registration number that's located on the front of the document.
- Enter a valid serial number in the older version of Final Cut Pro before upgrading
  The Final Cut Pro 3.0 Upgrade program requires that you have a previous valid and serialized version of Final Cut Pro. If you do not have an earlier version of Final Cut Pro, you won't be able to upgrade to Final Cut Pro 3.0.

Upgrading Final Cut Pro 3.0 for Mac OS 9

- You cannot install Final Cut Pro 3.0 for Mac OS 9 when you are using Mac OS X. Restart your computer using Mac OS 9, then you can upgrade to Final Cut Pro 3.0 for Mac OS 9.
- If your computer is set up for Multiple Users, make sure to log in as the "Owner" user.
- The Final Cut Pro 3.0 folder is installed in the Applications (Mac OS 9) folder by default. However, you can change this if you like, so the application is installed in a different location. The old version of Final Cut Pro is left unchanged.
- Make sure you keep your Upgrade CD on hand. As part of the registration process, you need to insert the Upgrade CD in your CD or DVD drive the first time you open Final Cut Pro 3.0.

Upgrading Final Cut Pro 3.0 for Mac OS X

- You need Final Cut Pro 1.0 or later, or Final Cut Pro 2.0 or later installed on your computer before you can use the Final Cut Pro for Mac OS X installer.
- Make sure you log in using the System Administrator account. If you only have one account for Mac OS X, it is also the System Administrator account.
- Open the Classic environment at least once. This step is necessary to set system variables that allows the upgrade program to find your Classic System folder while running under Mac OS X.

  Important: Make sure the selected Classic System Folder is the one with the Final Cut Pro system files. If you select a different System Folder before upgrading to Final Cut Pro 3, an alert box this message appears:

  "Registration Error (2). You must have a registered copy of Final Cut Pro installed. Please reinstall Final Cut Pro from its original CD, launch it, and complete the registration screen before running this computer."
- Final Cut Pro 3.0 for Mac OS X is installed in the Applications folder by default. However, you can change this if you like, so the application is installed in a different location.
- Make sure you keep your Upgrade CD on hand. As part of the registration process, you need to insert the Upgrade CD in your CD or DVD drive the first time you open Final Cut Pro 3.0.

Finding out about new features, late-breaking information, and an overview of the application

After you install Final Cut Pro, you can learn about new features and late-breaking information on known issues.

- To get the latest information about known issues with the application, choose Final Cut Pro Help from the Help menu and click "Late-breaking news."
- To find out about new features and enhancements, choose What's New? from the Help menu.
- To get a brief overview of the major tasks and windows in Final Cut Pro, choose Where Do I Start? from the Help menu.

Using the tutorials

There are several tutorials that come with Final Cut Pro. These are available in print in a separate book.

Using the documentation

The Final Cut Pro user's manual is divided into three volumes for ease of use. There is also an addendum, What's New in Final Cut Pro 3.

- Volume 1, Getting Started, Input, and Output: Covers everything you need to know to set up your Macintosh with Final Cut Pro, capture video for use in your project, and output to a variety of formats.
- Volume 2, Editorial: Focuses on basic and advanced editing techniques in Final Cut Pro, including transitions, trimming and working with audio.
- Volume 3, Effects and FXScript: Covers Final Cut Pro's compositing tools, including motion settings, filters, generators, and how to use FXScript to create your own custom filters and generators.
- What's New in Final Cut Pro 3: Includes information about new features, tools, and commands available in Final Cut Pro 3.0.

Final Cut Pro: How to Preview Real-Time Effects on an NTSC or PAL Monitor

The Final Cut Pro 3 user's manual states: "Video cannot be output over FireWire while you're playing G4 RT effects." This document explains how to preview real-time effects on an NTSC or PAL monitor.

This article has been archived and is no longer updated by Apple.

By using a PowerBook G4 or Power Mac G4 (1) computer with an S-video output port, you can view real-time effects on an external NTSC or PAL monitor. Follow these steps:

1. Connect the external NTSC or PAL monitor to the S-video output port on the computer's video card or PowerBook. **Important:** You may need to turn off your computer or put it to sleep before connecting video devices to the S-video output port.
2. Set the resolution of the external monitor to 720 by 480 for NTSC or 720 by 576 for PAL.
3. Open Final Cut Pro.
4. Choose Audio/Video Settings from the File menu (Mac OS 9), or Final Cut Pro menu (Mac OS X).
5. Choose Desktop (720x480) (or similar) from the External Video pop-up menu.
6. Click OK.
7. Choose External Video from the View menu, then choose All Frames from the submenu.

Video from the Viewer and Canvas should now play on the external NTSC or PAL monitor.

Notes

1. Power Mac G4 computers do not have an built-in S-video output port. You must install a video card that has an S-video output port.

QuickTime: Embedding QuickTime for web delivery

This article has been archived and is no longer updated by Apple.

Learn how to embed QuickTime content on an Internet web page. To see the full reference list for the Embed tag's attributes, go here.

The `<EMBED>` tag allows media file types other than those directly supported by the browser to be handled with an external application or plugin. In this case, the external application is QuickTime Player and the plugin is the QuickTime Plugin.

Note: With the release of Internet Explorer 5.5 SP2 and later, you must use an `<OBJECT>` tag in addition to the `<EMBED>` tag for your web pages to be compatible with both Netscape/Mozilla, Safari, and Internet Explorer on Mac and Windows systems.

Basic Necessities

The `<EMBED>` tag is similar to the `<IMG>` tag; they both have a `SRC`, `WIDTH` and `HEIGHT` parameter. These parameters are required and tell the browser the media to be displayed and the width and height of the media specified in the `SRC` attribute.

For example:

```
<embed src="sample.mov" width="320" height="256"></embed>
```

The `SRC` attribute is the media file to display either by an absolute or relative URL. The `HEIGHT` attribute specifies the vertical size in pixels of the `SRC` attribute. The `WIDTH` attribute specifies its horizontal size.

Watch the Size

In order for the controller to appear properly, add 16 pixels to the height of a movie.

For example:

Set `HEIGHT="256"` for a movie 240 pixels high: `<embed src="sample.mov" width="320" height="256"></embed>`

For a sound-only movie, use a height of 16 for the controller and any width that looks good on your Web page. (If you set the width to 16 for a sound-only movie, the controller is minimized to a single Play/Pause button.)

For example:

```
<embed src="sound.mov" width="216" height="16"></embed>
```

Never set `HEIGHT` or `WIDTH` to less than 2, even if the movie is hidden.

`AUTOHREF=value` (optional...requires QuickTime 4 or later)

> `AUTOHREF` can either be set to `TRUE` or `FALSE`. The default behavior is set to FALSE. When set to TRUE, the `AUTOHREF` attribute causes any URL specified in the HREF parameter to load immediately, without waiting for a mouse click.
>
> For example:
>
> <embed src="sample.mov" width="200" height="240" href="http://dns/foo.mov" autohref="true">

`AUTOPLAY=value` (optional...requires QuickTime 3 or later)

> `AUTOPLAY` can either be set to `TRUE` or `FALSE`. The default behavior is set by the user in the 'QuickTime Plug-in Settings.' When set to TRUE, the `AUTOPLAY` attribute causes the movie to start playing as soon as the QuickTime Plug-In estimates that it will be able to play the entire movie without waiting for additional data.
>
> For example:
>
> <embed src="sample.mov" width="200" height="240" autoplay="true">

`BGCOLOR=hex value` (optional...requires QuickTime 3 or later)

> This attribute specifies the background color for any space that is not taken by the movie. For example, if a 160x120 movie was embedded in a space of 200x120, there would be 40 pixels of undefined color space in the width. Specifying the hex value of the background color will fill the undefined space with the value chosen.
>
> For example:
>
> <embed src="sample.mov" width="200" height="240" bgcolor="000000">

`BGCOLOR=name` (optional...requires QuickTime 4)

The QuickTime 4 Plug-in has additional support for the BGCOLOR attribute by recognizing color names. Acceptable values for this attribute are:

"BLACK" (#000000), "GREEN" (#008000), "SILVER" (#C0C0C0), "LIME" (#00FF00),
"GRAY" (#808080), "OLIVE" (#808000), "WHITE" (#FFFFFF), "YELLOW" (#FFFF00),
"MAROON" (#800000), "NAVY" (#000080), "RED" (#FF0000), "BLUE" (#0000FF),
"PURPLE" (#800080), "TEAL" (#008080), "FUCHSIA" (#FF00FF), "AQUA" (#00FFFF)

For example:

```
<embed src="sample.mov" width="200" height="240" bgcolor="black">
```

`CACHE=value` (optional...requires QuickTime 3 or later)

If `CACHE=TRUE` is specified, the browser will `CACHE` movies. If the movie is in `CACHE` when the user returns to the page, the movie will be played from `CACHE` instead of downloading again. `CACHE` can either be `TRUE` or `FALSE`, or simply `CACHE`. `CACHE` by itself implies `TRUE`. The default behavior is set by the user in the 'QuickTime Plug-in Settings.'

Note: The functionality of this attribute is only supported by Netscape Navigator, version 3.0 or later.

For example:

```
<embed src="sample.mov" width="200" height="240" cache="true">
```

`CONTROLLER=value` (optional...requires QuickTime 3 or later)

The `CONTROLLER` attribute sets the visibility of the movie controller. `CONTROLLER` can either be `TRUE` or `FALSE`. By default, `CONTROLLER` is `TRUE`. If `CONTROLLER` is set to `FALSE`, the movie controller will not display.

Note: For compatibility with existing web pages, the default is `FALSE` for QuickTime VR movies, image files, and flash files.

Note 2: For poster movies, you would normally set `controller="false"`.

For example:

```
<embed src="sample.mov" width="200" height="240" controller="false">
```

See also `HEIGHT`

`CORRECTION=value` (optional...requires QuickTime 3 or later)

`CORRECTION` can either be `NONE` or `FULL`. By default, `CORRECTION` equals `FULL`. This attribute is only appropriate for QuickTime VR panoramas.

For example:

```
<embed src="sample.mov" width="320" height="240" correction="full">
```

`DONTFLATTENWHENSAVING` (optional...requires QuickTime 4)

`DONTFLATTENWHENSAVING` makes the plug-ins' 'Save as QuickTime movie' work the same way the 'Save as source' does. Adding the `DONTFLATTENWHENSAVING` tag saves the data into a movie file without flattening it.

For example:

```
<embed src="sample.mov" width="320" height="240" dontflattenwhensaving>
```

`ENABLEJAVASCRIPT` (optional...requires QuickTime 4)

ENABLEJAVASCRIPT can either be set to TRUE or FALSE. The default behavior is FALSE. If you want to control a QuickTime movie using JavaScript functions, you need to enable JavaScript for that movie by setting ENABLEJAVASCRIPT="TRUE".

For example:

<embed src="sample.mov" width="320" height="240" enablejavascript=true">

ENDTIME=*time* (optional...requires QuickTime 4)

The ENDTIME attribute defines the last frame of the movie. ENDTIME can be any time up to the duration of the movie. By default, ENDTIME is the duration of the movie. This attribute takes a time value in the form -- Hours:Minutes:Seconds:Frames (30ths). The frames component can be specified as a fixed point number so that more specific times can be specified for instance 3:30:22.5 means 3 minutes, 30 seconds and 22.5 frames.

For example:

<embed src="sample.mov" width="200" height="240" endtime="3:30:22.5">

See also STARTTIME

FOV=*integer* (optional...requires QuickTime 3 or later)

Only integer values between 8 and 64 degrees are supplied for this attribute. If no value is specified for FOV, the value stored in the movie is used. The FOV attribute allows you to specify the initial field of view angle for a QuickTime VR movie.

For example:

<embed src="sample.mov" width="320" height="240" fov="55">

GOTO*n* (Optional...Requires QuickTime 4)

See QTNEXT

HEIGHT=*size in pixels* (Required)

The HEIGHT attribute specifies the height of the embedded file in pixels. The HEIGHT attribute is **required** unless the HIDDEN attribute is specified. The HEIGHT of the movie can be found by choosing 'Get Info...' in the 'Movie' menu within QuickTime Player. If you do not use the SCALE attribute and you supply a height that is smaller than the actual height of the movie (plus 16 if you are showing the controller), the movie will be cropped to fit the height. If you supply a height that is greater than the height of the movie, the movie will be centered inside this height.

Note: Never specify a height of less than 2 as this can cause problems with some browsers.

Note 2: The movie controller is 16 pixels high, so add 16 pixels to the height of the movie to make the movie controller visible.

For example:

<embed src="sample.mov" width="200" height="240" controller="true">

See also WIDTH

HIDDEN (optional...requires QuickTime 3 or later)

There are no values to supply for this attribute. The HIDDEN attribute controls the visibility of the movie. If you do not supply HIDDEN, then the movie will be visible. If you supply HIDDEN, the movie is not visible on the page. This option is not appropriate for QuickTime VR Objects or Panoramas. The HIDDEN attribute is appropriate for sound-only movies which are hidden in the background.

Note: If you add the HIDDEN attribute, be sure to set AUTOPLAY="TRUE" as well.
For example:

<embed src="sample.mov" width="200" height="240" hidden>

HOTSPOTn="*url*" (optional...requires QuickTime 3 or later)

This attribute enables clicking on a hotspot with the specified ID in a VR panorama to take the user to the specified URL. *n* is the hotspot ID as defined when the hot spot is created in the QuickTime VR authoring tools.

You can use TargetN to target a hotspot URL to a frame or window, or to the special targets "quicktimeplayer" or "myself". For example:

<embed src="sample.mov" width="200" height="240" hotspot17="http://www.apple.com">

HREF=*url* (optional...requires QuickTime 3 or later)

When set, the HREF attribute provides a link to another page or movie when the movie is clicked on.

Note: If you are using a relative path name for the HREF then it should be relative to the location of the movie specified in the SRC attribute.

For example:

<embed src="sample.mov" width="200" height="240" href="http://www.apple.com/quicktime">

See also: TARGET and TARGET="QUICKTIME_PLAYER"

KIOSKMODE=*value* (optional...requires QuickTime 4)

KIOSKMODE is either TRUE or FALSE. By default, KIOSKMODE is FALSE. When KIOSKMODE is set to TRUE, the plug-in does not include its pop-up menu in the movie controller and does not allow drag and drop to save the movie.

For example:

<embed src="sample.mov" width="200" height="240" kioskmode="true">

LOOP=*value* (optional...requires QuickTime 3 or later)

LOOP is either TRUE, FALSE or PALINDROME. By default, LOOP is set to FALSE. When set, the LOOP attribute makes the movie play continuously. Setting LOOP to PALINDROME causes the movie to play alternately forwards and backwards. This option is not appropriate for QuickTime VR Objects and Panoramas.

For example:

<embed src="sample.mov" width="200" height="240" loop="true">

MOVIEID=*integer* (optional...requires QuickTime 4)

Just like MovieName, but uses a numeric ID instead of a name string. MovieID may be computed in the Wired Sprite scripts and may be useful where the MovieName of the target movie is not known.

For example:

<embed src="sample.mov" width="200" height="240" movieid="5">

MOVIENAME=*name* (optional...requires QuickTime 4)

With QuickTime 4.0 the targeting mechanism of wired actions has been extended to enable any action to target an element of another open movie. This means two or more movies within the same web page can communicate using the QuickTime 4.0 Plug-in. These same movies may communicate if they are opened in QuickTime Player if they are named using userdata atoms. For example, one movie can act as a controller for another movie setting things such as it's rate, volume, the pan angle of a QTVR track it contains, or the location of a sprite in a sprite track that it contains. In many cases things that required JavaScript can now be done using only the QuickTime Plug-in with Wired Movies.

For example:

<embed src="sample.mov" width="200" height="240" moviename="targetmov">

NODE=*integer* (optional...requires QuickTime 3)

The NODE attribute allows you to specify the initial node for a multi-node QuickTime VR movie. Only integer values are supplied for this attribute. If no value is specified for this attribute, the default NODE and view (specified at creation time of the pano movie) is used.

For example:

<embed src="sample.mov" width="320" height="240" node="128">

See also: FOV, PAN, TILT

PAN=*integer* (optional...requires QuickTime 3)

The PAN attribute allows you to specify the initial pan angle for a QuickTime VR movie. Only integer values are supplied for this attribute. The range of values for a typical movie would be 0 to 360 degrees. If no value for PAN is specified, the value stored in the movie is used. This attribute has no meaning for a standard QuickTime movie.

For example:

<embed src="sample.mov" width="320" height="240" pan="180">

See also: FOV, NODE, TILT

PLAYEVERYFRAME=*value* (optional...requires QuickTime 3)

PLAYEVERYFRAME is either TRUE or FALSE. By default, PLAYEVERYFRAME is set to FALSE. When set, the PLAYEVERYFRAME attribute causes the movie to play every frame of the movie even if it is necessary to play at a slower rate to do so. This attribute is particularly useful to play simple animations. This option is appropriate for QuickTime movies.

Note: Setting PLAYEVERYFRAME=TRUE will turn off all audio tracks.

For example:

<embed src="sample.mov" width="200" height="240" playeveryframe="true">

PLUGINSPAGE=*url* (optional)

The PLUGINSPAGE attribute allows you to specify a URL from which the user can fetch the necessary plug-in if it is not installed. This attribute is handled by your browser. If your browser cannot find the plug-in when loading your page, it will warn the user and allow them to bring up the specified URL, from which one could download QuickTime which includes the QuickTime Plug-In.

IMPORTANT: Please set this attribute to: "http://www.apple.com/quicktime/download/" which will point to the latest version of the plug-in. This option is appropriate for QuickTime movies and QuickTime VR Objects and Panoramas.

For example:

<embed src="sample.mov" width="200" height="240" pluginspage="http://www.apple.com/quicktime/download/">

QTNEXTn="*URL*" (optional...requires QuickTime 4)

QTNEXT can be used to specify the url of a movie to load and play at the end of the current movie. This allows up to 256 consecutive movies to play one after the other. This behaves exactly the same as if the movie has a HREF track with an auto-url ("A<url>") at the end of the movie. Where n is an integer greater than 0 and less than 256 that defines the index of the url in the playlist. A QTNEXT tag's value can be a url (and optional target) or GOTOn where "n" is the index of the QTNEXT url to load. This allows you to make an endlessly repeating playlist.

Note: that the original movie (the SRC attribute) is implicitly QTNEXT0.

Note 2: The target T<myself> is normally specified. If no target is specified, the URL replaces the current browser window, and any subsequent QTNEXT statements are ignored.
For example:

<EMBED SRC="nameof.mov" WIDTH="200" HEIGHT="240"
QTNEXT1="<http://www.apple.com/quicktime/movies/sample.mov> T<myself>"
QTNEXT2="<rtsp://www.apple.com/quicktime/movies/sample.mov> T<myself>"
QTNEXT3="<URL> T<myself>"
QTNEXT4="GOTO0"

See also: TARGET

QTSRC="*URL*" (optional...requires QuickTime 4)

This attribute allows content developers to force a browser to use the QuickTime Plug-in for a file no matter what its MIME type is. The attribute treats it's value as a URL to load, and ignores any data loaded by the browser from the "src" parameter.

For example:

<EMBED src="sample.mov" qtsrc="rtsp://www.apple.com/quicktime/sample2.mov">

This does not require the file type to be .mov. This can be any media type that QuickTime can read such as:

<EMBED src="sample.mov" qtsrc="rtsp://www.apple.com/quicktime/sample.mp3">

QTSRCCHOKESPEED (optional...requires QuickTime 4)

Using the QTSRCCHOKESPEED attribute gives content developers the ability to specify the datarate of a movie being served regardless of the connection speed an end user has. This may be useful when a particular movie is requested from a server by large volumes of users to eliminate congestion in routers.

Note: When setting the choke speed, you will specify the maximum datarate.

For example:

<embed src="sample.mov" width="320" height="240" qtsrcchokespeed=33600>

QTSRCDONTUSEBROWSER (optional...requires QuickTime 4)

QTSRCDONTUSEBROWSER can either be set to TRUE or FALSE. By default, the behavior is set to FALSE. When set to true, the URL specified in the QTSRC parameter is loaded using QuickTime's internal methods, instead of using the browser to fetch the file. This prevents the browser from caching the file, which speeds access to local movies and can help prevent copying movies over the Web.

For example:

<embed src="foo.mov" qtsrc="sample.mov" width="320" height="240" qtsrcdontusebrowser>

SCALE=*value* (optional...requires QuickTime 3)

SCALE is either TOFIT, ASPECT or a number. By default the value of SCALE is 1. If set to TOFIT, the movie is scaled to fit the embedded box as specified by the HEIGHT and WIDTH attributes. If this is set to ASPECT, the movie will scale to fit the embedded box while maintaining the aspect ratio. If this is set with a number, the movie will be scaled by that number (e.g. 1.5). Note: Using the number scale attribute with a QTVR Panorama movie can degrade the performance of the movie even on high-end systems.

For example:

```
<embed src="sample.mov" width="200" height="240" scale="tofit">
```

SRC=*URL* (required)

The SRC attribute defines the url to the file for the plugin or helper application to play. The SRC attribute is the most common way to embed the media, except for occasional instances where the TYPE attribute may be necessary.

For example:

```
<embed src="sample.mov" width="200" height="240">
```

See also: TYPE

STARTTIME=*time* (optional...requires QuickTime 4)

The STARTTIME attribute defines the first frame of the movie. STARTTIME can be any time within the length of the movie. By default, STARTTIME is the first frame of the movie (or 00:00:00). This attribute takes a time value in the form Hours:Minutes:Seconds:Frames (30ths). The frames component can be specified as a fixed point number so that more specific times can be specified for instance 3:30:22.5 means 3 minutes, 30 seconds and 22.5 frames.

Note: For fast start movies, the entire file is still downloaded even if a STARTTIME is specified.

For example:

```
<embed src="sample.mov" width="200" height="240" starttime="00:15:22.5">
```

See also: ENDTIME

TARGET="QUICKTIMEPLAYER" (optional...requires QuickTime 4)

When set, the QuickTime Plug-in will launch QuickTime Player as a helper application (if it is not already running) and opens the url of the movie file. In order for TARGET="QUICKTIMEPLAYER" to work, there needs to be an href attribute in the embed tag which points to the movie file.

For example:

```
<embed src="poster.mov" width="200" height="240" href="sample.mov" target="quicktimeplayer">
```

TARGET="MYSELF" (optional...requires QuickTime 4)

When set, the QuickTime Plug-in will replace the movie specified in the SRC parameter with the movie specified in the HREF attribute when a user clicks on the movie. In order for TARGET="MYSELF" to work, there needs to be an HREF attribute in the embed tag pointing to a media type.

For example:

```
<embed src="poster.mov" width="200" height="240" href="sample.mov" target="myself">
```

See also: HREF

TARGET*n*="*FRAME_NAME*" (optional...requires QuickTime 3)

TARGET is an optional attribute, used in conjunction with the HOTSPOT or HREF attributes. When set, the TARGET attribute is the name of a valid frame (including _self, _top, _parent, _blank or an explicit frame name) that will be the target of a link specified by the HOTSPOT or HREF attribute. Leaving TARGET unspecified will open the new file in the same place as the current movie.

For example:

```
HOTSPOT32="http://www.apple.com/quicktime" TARGET32="_blank"
```

would specify that when hotspot 32 is clicked, the QuickTime home page will load in a new window.

NOTE: It is important to use the same ID# for both the HOTSPOT and TARGET for each URL reference. This ensures that the plug-in knows what HOTSPOT goes with what TARGET.

TARGETCACHE=*value* (optional...requires QuickTime 4)

The TARGETCACHE attribute allows content creators to cache the movie the poster movie is targeting.TARGETCACHE is either TRUE or FALSE. By default, TARGETCACHE is FALSE.

For example:

```
<embed src="poster.mov" width="200" height="240" cache="true" href="sample2.mov" TARGET="myself" targetcache="true">
```

TILT=*integer* (optional...requires QuickTime 3)

The TILT attribute allows you to specify the initial tilt angle for a QuickTime VR movie. Only integer values are supplied for this attribute. The range of values for a typical movie would be -42.5 to 42.5 degrees. If no value for TILT is specified, the value stored in the movie is used. This attribute has no meaning for a standard QuickTime movie.

For example:

```
<embed src="sample.mov" width="320" height="240" tilt="20.0">
```

See also: FOV, NODE, PAN

TYPE="MIMEtype" (optional)

TYPE="MIMEtype" specifies the MIME type of the EMBED file, which in turn determines which plug-in to load. Use the TYPE attribute for a plug-in that requires no data, for example, a plug-in that draws an analog clock or fetches all of its data dynamically. For a visible plug-in, you must include both the WIDTH and HEIGHT attributes if you use TYPE; no default values are used.

Note: The functionality of this attribute is only supported by Netscape Navigator, version 2.0 or later.

For example:

```
<embed src="sample.mov" type="video/quicktime" width="200" height="240">
```

URLSUBSTITUTE="<String>:<SubstituteURL>" (optional...requires QuickTime 4)

Replaces every instance of String with SubstituteURL inside any HREF tracks, sprite action URLs, or VR hotspot URLs. Both String and SubstituteURL must be surrounded by angle brackets, and the two must be separated by a colon. The value n may be any integer from 1 to 999, and may be omitted if only one URLSUBSTITUTE parameter is specified. Use this parameter to repurpose QuickTime movies with embedded URLs without editing the movies.
For example:

```
<embed src="sample.mov" width="200" height="240" urlsubstitute="<samplestring>:<http://dns/foo.mov>">
```

VOLUME=*value* (optional...requires QuickTime 3)

The VOLUME attribute sets the movie's initial audio volume. Only integer values between 0 through 100 are applied for this attribute. By default, VOLUME is set to 100. A setting of 0 effectively mutes the audio whereas a setting of 100 is the maximum volume.

For example:

```
<embed src="sample.mov" width="200" height="240" volume="50">
```

`WIDTH=size in pixels` (required)

The `WIDTH` attribute specifies the `WIDTH` of the embedded file in pixels. The `WIDTH` of the movie can be found by choosing 'Get Info...' in the 'Movie' menu within QuickTime Player.

For example:

```
<embed src="sample.mov" width="200" height="240">
```

See also: `HEIGHT`

Final Cut Pro 3: "General Error 34" During Tutorial

While following the Compositing and Effects portion of the Final Cut Pro 3 tutorial, you may encounter a "General Error 34" in the program. This can occur on page 90 of the Tutorial guide while trying to move Dances.psd layers in the timeline. After the alert is dismissed, the canvas window is red with white letters stating "Display unavailable. Close and reopen window to restore."

This article has been archived and is no longer updated by Apple.

Symptom

An alert box with this message appears: "General Error 34".

Products Affected

- Final Cut Pro 3

Solution

Follow these steps to resolve the issue:

- In the Browser, delete the Dances.psd file.
- Choose Import from the File menu, then choose Files from the submenu (or type Command-I).
- Navigate to the tutorial folder, and then to the Compositing Pieces folder.
- Select the file called Dances.psd.
- In the Browser window, drag the newly created Dances.psd file into the Graphics bin.

You can now continue with the Compositing and Effects tutorial.

Troubleshooting songs that skip on iPod

Find out what you can do if a song skips while playing.
This article has been archived and is no longer updated by Apple.

Install the latest iPod software

Always update your iPod with the latest software before troubleshooting.

Use compressed songs

iPod's skip protection works best with compressed audio files. This allows multiple songs to fit into iPod's memory cache.

If your audio files are large, or are uncompressed (such as songs in AIFF format), you may want to compress them, and use the MP3 or AAC compressors when importing new songs. Consider breaking large files into smaller files. If your songs aren't compressed, in AIFF or WAV format, for example, they take up a lot more space. Instead of holding 25 minutes of music, the cache can only hold a few minutes. This means the hard drive has to work a lot harder to keep the cache full. Since it has to turn on a lot more often, the hard disk is more prone to be affected by movement as it loads the cache, and that could make a song skip. More hard drive access can also affect battery life.

Avoid shaking iPod

iPod provides skip protection by playing music from its solid-state cache. When all the music stored in the cache has played, iPod's hard drive copies more music to the cache. Shaking iPod while the hard drive is copying music can cause songs to skip.

Make sure song files are not damaged

If just one song skips when you play it, it may be damaged.

1. Delete the song and update your iPod.
2. Insert the CD you used to import the song, and import it again. If the CD is scratched or dirty, iTunes may not be able to import the song. Try cleaning the CD or use a different one.
3. Update your iPod with the new copy of the song.

Unplug the USB cable or turn off the EQ

If you have an iPod (with Dock Connector) model and you're using a Windows PC, unplug the USB cable from iPod, or turn off the EQ.

Reset iPod

Resetting iPod can sometimes help. When you reset iPod all your songs and files are saved, but some customized settings may be lost.

Restore iPod

If all the songs you play skip and their file sizes are small, you may need to restore iPod. **Warning:** The restore process cannot be undone. All the songs and files on your iPod will be deleted. Always keep a backup of your important files. Content in your iTunes Library will not be affected by restoring your iPod.

Mac OS X: Audio Playback Skips on Computers With Dual Microprocessors

Update Mac OS X to resolve an issue in which audio may skip during playback.
This article has been archived and is no longer updated by Apple.

Symptom

Under certain conditions audio playback skips. This may happen when playing MP3 files with any MP3 player application, but is especially apparent during network activity, such as viewing Web pages using Internet Explorer.

Solution

Download and install Mac OS X 10.1.2 or later. Use the Software Update pane of System Preferences, or download the update from Apple Software Downloads (http://www.apple.com/swupdates/).

Final Cut Pro and iMovie: Cameras in SDL Mode Not Recognized

Some consumer DV cameras have a recording mode called SDL, which increases recording time on mini-DV cassettes by reducing the track width and slowing down the tape speed. In some cases, trying to capture from a camera in SDL mode in iMovie and Final Cut Pro can result in the application not recognizing the camera or not capturing any video.

This article has been archived and is no longer updated by Apple.

Symptom

In iMovie, the camera is not recognized. In Final Cut Pro the camera is recognized but no video can be seen or captured.

Solution

Using the camera's menu system, switch it from SDL mode to "SD" or "Standard" recording mode. After this you may need to turn the camera off and on before Final Cut Pro or iMovie will recognize it.

Additional information

SDL is an open industry standard specified by ISO/IEC 61883 and 61834. Other long play formats are not affected by this issue.

iPod: How to Browse by Artist

This document describes how to browse iPod for a songs by a specific artist.
This article has been archived and is no longer updated by Apple.
If a song on iPod has information about the performing artist, you can look for the song by artist.

1. Select Artists from the main menu.
2. Select an artist's name.
3. Select an album title.
4. Scroll to the song you want and press the Play button.

If there are no album names listed after selecting an artist's name, then select All. Songs that do not have an album listed in the MP3 tags appear under the All listing.

You can push Play in the artist list to play all songs by the selected artist.

See technical document 61043: "**iPod: How to Browse by Album Title**" and technical document 25293: "**MP3 ID Tags: What Are They?**" for additional information.
Published Date: Feb 20, 2012

iPod: How to Browse by Album Title

This document describes how to browse iPod by album title.
This article has been archived and is no longer updated by Apple.
Follow these steps to browse by album title:

1. Select Artists in the main menu.
2. Select All from the top of the list. A list of all of the albums appears. Songs that do not have an MP3 tag for album title do not appear in this list.
3. Click All again to display songs titles grouped by album title. Songs without an album MP3 tag appear at the bottom of the list.

You can push Play while in the album list to play all songs on the selected album.

See technical document 61042: "**iPod: How to Browse by Artist**" and technical document 25293: "**MP3 ID Tags: What Are They?**" for additional information.

Mac OS X: Unable to Open QuickTake 100, 150 Pictures

The QuickTake 100 and QuickTake 150 digital cameras have a unique codec (compressor-decompressor) that is not available in Mac OS X. QuickTake Pictures must be converted to a different compression format under Mac OS 9 or earlier to be opened in Mac OS X.
This article has been archived and is no longer updated by Apple.

Symptom

Symptoms vary depending on the application importing the pictures. They can include an alert box with a message about the compressor not being found, the picture may open as a white frame, or the files may not be recognized as photos.

Solution

The pictures must be exported to a different format when started from Mac OS 9 or earlier startup disk. No matter which program is used to convert the pictures, the QuickTake Image extension must be present in the Extensions folder of the startup disk. QuickTake Image is installed with the QuickTake Software Installer.

You could use these conversion applications:

- Picture Viewer (with QuickTime Pro)
- Graphic Converter
- Photoshop
- PhotoFlash

Review the documentation for the conversion application for specific steps on how to convert images. You should convert the files to JPEG or TIFF formats, either of which is compatible with Mac OS X.

Mention of any third-party products is for informational purposes only, and constitutes neither an endorsement nor a recommendation.

iTunes: About import settings and hard disk space

This article has been archived and is no longer updated by Apple.

About import settings and hard disk space

When you import a song into the library, the song is encoded and stored on your hard disk. The amount of space the file takes up depends on the song and the import settings that are chosen in iTunes preferences. The import settings also affect the audio quality of the imported song. Larger files take up more hard disk space, but generally sound better.

The default encoding format in recent versions of iTunes is MPEG-4 AAC, a compressed format that rivals the sound quality of audio CDs.

AAC-encoded files will sound as good as or better than MP3 files encoded at the same or even a higher bit rate. For example, a 128 kbps AAC file should sound as good as or better than a 160 kbps MP3 file. Because the bit rate is lower, the AAC file will also be smaller than the MP3 file. AAC files allow you to store the most music on your hard disk or iPod, and may allow for longer battery life on the iPod. The High Quality AAC setting creates files that are usually less than 1 MB for each minute of music.

If you plan to transfer files to a third-party digital music player, you might want to choose the MP3 Encoder and the High Quality setting to fit more songs on the player. The High Quality MP3 setting creates files that are about 1 MB in size for each minute of music.

The WAV and AIFF encoders do not compress the songs. They make files that are several times larger than AAC or MP3 files and take up a large amount of hard disk space (about 650 MB per CD or 10 MB per minute of music). Encoding music using the Apple Lossless encoder will preserve the high-quality sound found on the CD but create significantly smaller files than the WAV and AIFF encoders. Files encoded with the Apple Lossless encoder are still much larger than files created using either the default 128 kbps AAC or MP3.

iTunes: About Equalizers

This article has been archived and is no longer updated by Apple.

An equalizer (EQ) lets you fine-tune specific frequencies of the sound spectrum, much like the treble and bass controls of a stereo, but with even more power and flexibility.

By adjusting the different frequencies, you can customize your music playback for different musical genres, listening environments, and output methods (such as speakers or headphones).

The horizontal values on the equalizer represent the spectrum of human hearing in hertz (hz). 32 Hz represents the deepest frequency (bass), 250 Hz and 500 Hz represent the mid-range frequencies, and 1 kHz to 4 kHz represent the higher frequencies (treble).

The vertical values on each bar are represented in decibels (dB), units that measure the volume or intensity of each hz frequency. By moving the sliders (also called "faders") up or down, you increase or decrease the sounds that you hear in that particular frequency range.

Preamp is a secondary volume adjustment that is applied to all frequencies equally. You might want to increase or decrease the preamp volume when listening to music that was recorded particularly quietly or loudly.

iTunes lets you adjust the equalizer settings yourself, or choose from over 20 presets of the most commonly used EQ settings.

Published Date: Feb 20, 2012

How to adjust the sound volume on iPod

This article has been archived and is no longer updated by Apple.

If you see the Now Playing screen, which shows the title of the song or audiobook playing, you can use the wheel to adjust the volume.

If you don't see the Now Playing screen, select Now Playing in the main menu. Then use the wheel to raise or lower the volume.

If nothing is playing, you can't change the volume.

How to turn on iPod‘s backlight

iPod has backlighting, so you can see the display in low light.

This article has been archived and is no longer updated by Apple.

You can configure iPod so the backlight turns on for a set amount of time when you press a button or move the scroll wheel.

To access the backlight settings:

1. Select **Settings** > **Backlight Timer**.
2. Select a setting from the menu. Options include having the backlight timer:
    - Off
    - Turn off after a period of time between 2 and 20 seconds
    - Always on

A backlight on/off switch can be added to the Main menu by selecting:
Settings > **Main Menu** > **Backlight**

With iPod models prior to Fifth Generation iPod and iPod nano, you can also press and hold the Menu button down to toggle the backlight on or off. Find out which iPod model you have.

Mac OS X: About seeing your disks and servers

Your computer comes with at least one hard disk and you may use other disks with it. If your computer is on a network, you may connect to servers and shared folders.
This article has been archived and is no longer updated by Apple.
To see which disks and servers you are using, look on the desktop or click the Computer button in a Finder window toolbar.

If icons for the disks and servers do not appear on the desktop, choose Preferences from the Finder menu and select the items you want to show there.
Published Date: Oct 7, 2016

Mac OS X: How to make an alias

To make it easier to access an application, document, or folder from another folder or the desktop, you can create an alias to it.
This article has been archived and is no longer updated by Apple.
In the Finder, open a window showing the item. Press the Command and Option keys while you drag the icon to another folder or the desktop.

If you want to find the original item of an alias, select the alias and choose Show Original from the File menu.
Published Date: Oct 7, 2016

Mac OS X: How to get information about applications, files, folders and disk drives

You can see information about applications, files, folders, disks, and servers.
This article has been archived and is no longer updated by Apple.
You can also change settings for these items.

Mac OS X 10.0 - 10.1.5
In a Finder window, select the item and choose Show Info from the File menu. Use the General Information pane to lock a file or folder and make a file work like stationery.

Choose Name & Extension from the pop-up menu to change the name of the item and show or hide the filename extension.

For a file, choose "Open with application" to select the application to open the file.

Choose Privileges to change access privileges for an item.

Mac OS X 10.2
In a Finder window, select the item and choose Get Info from the File menu. To protect your files from being changed or deleted, you can lock them. In the Finder, select the file you want to protect and choose Get Info from the File menu. Select the Locked checkbox.

To make changes to the file, deselect the Locked checkbox.

Mac OS X: About controlling access to files and folders

If your computer is on a network and you turn on file sharing, other people can access your Public folder from the network. You can control access to items in your Public folder.
This article has been archived and is no longer updated by Apple.
Select your Public folder, then choose Show Info from the File menu. Choose Privileges from the pop-up menu and select access privileges for the owner, group, or everyone.

To select privileges for a group, you must log in as a member of the group or as an administrator.

Your Public folder contains a Drop Box folder. Other people can copy files to your Drop Box, but they cannot see its contents.

Macintosh: How to troubleshoot a FireWire device that isn‘t working

Follow these steps to troubleshoot a FireWire device that isn't working.

This article has been archived and is no longer updated by Apple.

Make sure all FireWire devices are turned on and all cables and power cords are plugged in. Make sure the cables are no more than 15 feet (4.5 meters) long and that you haven't connected a device to the computer in two ways.

Be sure you installed any software that came with the device. Check the manufacturer's Web site for the latest software.

If the device still doesn't work, try quitting and restarting any applications that use the device.

How to connect a display to your Mac

You may be able to connect certain displays to your computer with or without an adapter.

This article has been archived and is no longer updated by Apple.

Your computer, display, or graphics card may have more than one video output port. Each type of port requires a special cable.

If the display you want to use has a port that is different from those on your computer, you may be able to purchase adapters or other products from third-party manufacturers to connect them. (You may also need to update software so that your computer works correctly with the display.)

For example, you can use an adapter to connect a flat panel display to an earlier computer.

See your Apple-authorized dealer or check out the Macintosh Products Guide (http://guide.apple.com/) for more information.

What kind of recordable CD media can you use with a Mac?

Your optical drive can "burn" (record) your favorite music, computer applications, documents, and other digital files on recordable CDs. You can create your own music CDs and play them on a standard audio player.

This article has been archived and is no longer updated by Apple.

CD-R (CD-Recordable) and CD-RW (CD-Rewritable) discs come in normal and high-speed formats. You can write once to CD-R discs or erase and rewrite data to CD-RW discs.

You can't write (save) anything on a CD-ROM disc.

Published Date: Feb 19, 2012

Choosing a disc format for burning a CD in Mac OS X

This article has been archived and is no longer updated by Apple.

Learn about your options when choosing a format to burn a CD.

Note: This document applies to Mac OS X 10.1 through 10.3.9.

Mac OS X 10.2 through 10.3.9

When you insert a blank CD-R or CD-RW disc, you can select from a list of optional applications

- Open Finder
  Use when burning a HFS Plus/ISO 9660 hybrid disc.
- Open iTunes
  Use when burning Audio CD or MP3 (ISO 9660) disc, as specified in iTunes preferences.
- Open Disk Copy
  Use when burning a disc from an image file.
- Open Other Application
  Use this to open a specified application such as a third-party disc burning application.
- Run Script
  Use this to run an AppleScript. Normally this is used if you want to create your own automated burning script.

If you have a computer that can burn DVD-R discs, inserting a DVD-R disc in Mac OS X 10.2 provides the additional option to open iDVD. With Mac OS X 10.2.8 or earlier, DVD-R discs burned in the Finder are Mac OS Extended format (HFS Plus), not hybrid. With Mac OS X 10.3 or later, they are hybrid.

Mac OS X 10.1 to 10.1.5

Your computer gives you three options for preparing a blank CD for burning: Standard (HFS Plus/ISO 9660), iTunes (Audio CD), and MP3 (ISO 9660).

Choose Standard format if you want to save data or multimedia files on your CD. A file on a standard format CD can be read on both PC and Macintosh computers using any application that can recognize the file format. Standard format also lets you use long file names and international file names, and allows the encoding of larger files.

Note: If you are viewing your CD from an operating system that supports only eight-character file names, a longer file name on the CD is truncated into an eight-character filename made up of the first six characters of the name, a tilde (~), and a unique number.

Macintosh: About CD-R and CD-RW Discs

About CD-R discs

This article has been archived and is no longer updated by Apple.

You can burn a CD-R (CD-Recordable) disc once. Once files are written, they cannot be changed or deleted. With some third party applications, you may still be able to add more information in multiple burning sessions until the disc is full. See the documentation that came with your third-party application for specific information about recording on your CD-R disc.

It is best to use CD-R discs for recording audio CDs, because most standard audio CD players cannot read CD-RW discs. For longer-term storage and reliability, use CD-R discs.

About CD-RW discs

CD-RW (CD-Rewritable) discs can be erased and reused multiple times. However, some software for burning media files on CDs can write data on the disc only once. With some external CD-RW drives, you can add more information in multiple burning sessions until the disc is full, depending on the application you use. See the documentation that came with your external drive and application for specific information about multiple-session recording on your CD-RW disc.

CD-RW discs may be incompatible with some older computers and audio CD players. See the documentation that came with your CD burning application.

iMovie 2 for Mac OS X v10.1.x: How to Install Additional Plug-Ins

You can extend iMovie's features by installing plug-ins. Apple and third parties have created plug-ins for iMovie. This document explains how to install additional plug-ins in iMovie for Mac OS X v10.1.x.
This article has been archived and is no longer updated by Apple.

How to install additional plug-ins

1. Quit iMovie, if it is open.
2. Click the Finder in the Dock.
3. Choose Go to Folder from the Go menu.
4. Type "~/Library" and click Go.
5. If you don't see a folder named "iMovie" choose New Folder from the File menu, and name it "iMovie".
6. Open the iMovie folder.
7. If you don't see a folder named "Plug-ins" choose New Folder from the File menu and name it "Plug-ins".

The resulting path should look something like this:
Macintosh HD/Users/Your User Name/Library/iMovie/Plug-ins/

8. Copy any additional iMovie 2 for Mac OS X plug-ins into the Plug-ins folder.
9. Open iMovie.

The iMovie Plug-in pack 2.1.1 for Mac OS X is available from the iMovie Web site (http://www.apple.com/imovie/).

iMovie: Automatic Scene Detection Requires That Camera Clock Be Set Properly

For iMovie's "Automatically start new clip at scene break" feature to work, you must make sure your camera's clock is set properly.
This article has been archived and is no longer updated by Apple.

Symptom

iMovie's scene detection feature doesn't work. Scenes that should be imported separately are imported together.

Solution

Make sure your video camera's clock is set correctly, and that the camera's battery is charged.

iMovie's scene detection uses the time stamp from your camera's internal clock. If scene detection is not working, you should make sure the camera's clock has been set and is running properly. Many cameras have a small battery that powers the clock. If this battery hasn't been installed, or if its power has been depleted, your camera's clock will not run and your tapes will not have the time stamp iMovie needs to detect scene breaks. Consult the manual that came with your camera for more information.

Troubleshooting iPod‘s headphones

If you think your iPod or iPod mini headphones aren't working correctly, try these simple troubleshooting steps.

This article has been archived and is no longer updated by Apple.

If you have the Apple In-Ear Headphones, first see Tip - Getting Optimal Audio Quality before continuing.

Connect the iPod headphones to the sound output port ("speaker jack") on your computer or another audio device that has a 3.5 mm stereo headphone jack. If the issue with the headphones is still apparent, you can request replacement headphones from the iPod Service Website.

If the issue with your iPod headphones is not apparent on another device, try connecting a different set of headphones with a 3.5 mm plug to your iPod. If the issue is apparent with these headphones on your iPod, you can arrange to have your iPod repaired at the iPod Service Website.

Final Cut Pro 3: Troubleshooting Installation Issues

This document describes how to troubleshoot situations where the Final Cut Pro 3 application or installer unexpectedly quits, or an alert box with this message appears: "Final Cut Pro requires a System ID file which is either missing or invalid. Please reinstall using the original CD that was used to install Final Cut Pro."

This article has been archived and is no longer updated by Apple.

Symptom

An alert box with this message appears:

> "Final Cut Pro requires a System ID file which is either missing or invalid. Please reinstall using the original CD that was used to install Final Cut Pro."

OR

The Final Cut Pro 3 installer unexpectedly quits near the end of the installation process.

OR

The Final Cut Pro 3 application unexpectedly quits directly after installation.

Solution

Try one or more of the following troubleshooting steps:

- If you are using Final Cut Pro on a dual-processor computer in Mac OS X, download and install the Final Cut Pro 3.0.1 update.
- Be sure to carefully follow the instructions in technical document 75215: "**Final Cut Pro 3: Before You Install**" or technical document 61001; "**Final Cut Pro 3: Before You Upgrade**". (These are also displayed by the installer.)
- Check Apple Software Downloads (http://www.apple.com/swupdates/) for the latest Final Cut Pro updates.
- In the Internet pane of System Preferences, in the Email tab, make sure that the User Account ID and Outgoing Mail Server fields are either both
  filled or both empty before installing. The installer can fail if one field is filled out and the other is empty, resulting in a Final Cut Pro 3 application that will not open. This applies to Mac OS X only.
- Reinstall from the original Final Cut Pro CD
- If you are installing Final Cut Pro for Mac OS 9, do not run the installer from Mac OS X in Classic. If you have already done so, you will need to
  uninstall and reinstall the software by following the next step.

  Important: Installing a Final Cut Pro update while the application is running will result in an incomplete installation. Make sure that you quit the
  program before installing an update.
- If the issue persists even after reinstalling, follow these steps:
  1. If using Final Cut Pro for Mac OS X, delete the Final Cut Pro 3 application package. If using Final Cut Pro for Mac OS 9, delete the Final Cut Pro 3 folder. **Note:** Be sure to remove any files you may have added to these directories, such as custom FXScripts.
  2. Remove any of the following folders that may be present on your drive(s):
     /Library/Application Support/Final Cut Pro System Support (Mac OS X only)
     /System Folder/Application Support/Final Cut Pro System Support (Mac OS 9 only)
     /System Folder/Preferences/Final Cut Pro User Data (Mac OS 9 only)
     Note: By deleting these folders you will lose FCP preferences such as custom presets, setups, and window layouts.
  3. Empty the Trash
  4. Disconnect third-party hardware such as USB devices
  5. Reinstall from the original Final Cut Pro CD

Mac OS X 10.1: DVD Player 3.1 Unexpectedly Quits With a "System Error"

After upgrading to DVD Player 3.1, the application may unexpectedly quit if the General pane of System Preferences is set to use an Appearance setting other than "Blue".
This article has been archived and is no longer updated by Apple.

Symptom

DVD Player 3.1 quits unexpectedly when opened and an alert box with this message appears: "A system error has occurred. 1852402768".

This happens if the preferred language is something other than English in the International pane of System Preferences, and if something other than Blue is selected in the Appearance pop-up menu of the General pane of System Preferences.

Solution

Download and install DVD Player 3.1.1 or later.

Final Cut Pro: Tips For Installing 3.0.1 Update

This document lists four things to check if the Final Cut Pro 3.0.1 Update cannot be successfully completed.

This article has been archived and is no longer updated by Apple.

Check these items if the Final Cut Pro 3.0.1 Update cannot be successfully completed.

1. Application renamed

If you've renamed the application to something other than "Final Cut Pro" then the installer won't work.

2. Wrong folder selection

If an alert box with this message appears: "Unable to start Final Cut Pro. One or more plugins are missing", the Updater and the Installer were not installed in the same folder. Repeat the procedure and be careful to choose the folder that contains the Final Cut Pro 3.0 application.

3. Wrong updater

Important: If, after installing the Final Cut Pro 3.0.1 Updater, you are unable to get past the Final Cut Pro serial number dialog, you have used the wrong version of the Final Cut Pro 3.0.1 Updater. Download the version of the Updater that matches your version of Final Cut Pro 3.0, and follow the instructions "When Final Cut Pro 3.0 has already been installed."

4. Get Info window is open

The Show Info window must be closed while the updater is installing the software. Otherwise, the Finder's Show Info window will continue to show the incorrect version, size, and icon until you restart the computer.

iPod: How to use the equalizer

This article has been archived and is no longer updated by Apple.

You can use equalizer presets to change iPod's sound to suit a particular music genre or style.

For example, to make rock music sound better, set the equalizer to Rock.

Select Settings in the main menu. Then select EQ and select a music type.

If you assign an equalizer preset to a song using iTunes, then turn on the iPod's equalizer by selecting any equalizer setting other than off. The song will play using the iTunes setting if the iTunes setting exists on iPod.

You can't create custom equalizer settings on iPod, or transfer custom settings to iPod.

Published Date: Oct 7, 2016

Scrolling to any point in a song on iPod

This article has been archived and is no longer updated by Apple.

With iPod 1.1 software or later you can scroll backwards or forwards to any point in a song while it is playing. This feature is sometimes called "scrubbing."

1. From the Now Playing screen, press the Center button. A diamond symbol indicates the point in the song that is selected.
2. Use the scroll wheel to go to any point in the song. The diamond symbol moves as you scroll, and the elapsed time and time remaining indicators change.
3. The song continues playing from the point where you stopped scrolling. You may also press the Center button to continue playing.

This feature is useful if you want to go to a particular part of a song or recording, such as an audiobook.

Tip: You can also press and hold the Fast-forward or Rewind buttons instead of scrolling to go to any point in the song.

Note: Scrubbing is only available from the Now Playing screen. It is not available via a workout from the Nike+iPod menu.

If you have an iPod shuffle, you can use Fast-forward and Rewind, but you can also find additional audio book navigation tips here.

iPod: vCard fields that can be displayed

This article has been archived and is no longer updated by Apple.

iPod can display certain fields in vCards that following the vCard 2.1 and 3.0 format.

iPod software can display information from these vCard fields:

- fn -The contact's formatted name (how it is sorted)
- n - The contact's name as it appears in the Contact
- adr & add - The contact's address(es)
- tel - The contact's telephone number(s)
- email - The contact's email address
- title - The contact's title
- org - The contact's company name
- url - The contact's Web address
- note - Notes on the contact

Note: In order to see notes attached to specific contacts on the iPod as entered in the Mac OS X Address Book application, you may need to turn on the option to "Export notes vCards" from the Address Book application's preferences (under vCard preferences).

Any other information stored in a vCard is ignored by iPod. Applications such as Mac OS X's Address Book, Eudora, Microsoft Entourage, and Palm Desktop 4.0 allow you to export your contacts' names and addresses as vCards.

Sample

Here are the contents of the Sample vCard included with iPod software:

```
begin:vcard

iPod 1.1: How to delete a contact

This document explains how to delete a contact from iPod's Contacts list.
This article has been archived and is no longer updated by Apple.
To delete a contact from iPod's Contacts list:

1. Make sure iPod is set up to be used as an external hard disk.
2. Connect iPod to your computer. The iPod appears as a hard disk on your desktop or in a Finder window.
3. Open the iPod hard disk.
4. Open the folder named "Contacts".
5. Find the vCard for the contact you want to delete.
6. Drag the vCard to the Trash.

Tip: It is possible for more that one contact to be stored in a single vCard file. If this is the case, you'll have to determine which file stores the contact you want to delete.
Published Date: Oct 7, 2016

One or more contacts don‘t appear in iPod‘s Contacts list

This article has been archived and is no longer updated by Apple.

Follow these steps if one or more contacts don't appear in iPod's Contacts list even though their vCard is in the Contacts folder.

1. Make sure the contact's vCard is in a compatible format, either 2.1 or 3.0.
2. Make sure the vCard was copied to the Contacts folder. The folder's name must be spelled correctly. It is not case sensitive.
3. Use a contact manager application, such as Mac OS X's Address Book, to make a new vCard. Copy it to iPod's Contacts folder and see if it appears.
4. Reset iPod. When you reset iPod all your music and data files are saved, but some customized settings may be lost.

Only part of a vCard is displayed on your iPod

iPod only displays certain fields of a contact's vCard.

This article has been archived and is no longer updated by Apple.

While your contact or email application program may store more information in a vCard, iPod does not display that information. To see a list of fields iPod displays, see technical document 61568: "iPod 1.1: Contact vCard Fields That Can Be Displayed."

Published Date: Oct 11, 2016

iPod 1.1: Contacts list sorting

iPod sorts the Contacts list using the vCard "formatted name" field.
This article has been archived and is no longer updated by Apple.
This field typically contains a person's full name beginning with the first name. Example: "Thomas Grey" is a formatted name beginning with the first name. iPod sorts this contact on Thomas and not on Grey. You can see the "fn" field in the sample vCard below.

Using a text editor, such as TextEdit, you can change a contact's sort order by modifying the information in the "fn" field. For example, changing "fn:Thomas Grey" to "fn:Grey, Thomas" causes iPod to sort on the last name instead of the first name.

Important: Certain characters may sort differently than expected on iPod. For example, a name beginning with the letter É, such as Étienne, will sort to the bottom of the list instead of among the contacts that begin with the letter E.

For more information on the vCard format in general, see http://www.imc.org/pdi/ .

Sample

Here are the contents of the Sample vCard included with iPod 1.1 software:

```
begin:vcard
version:3.0
fn:Sample

iPod (10 GB): Capacity Appears to Be 5 GB, There Is No Contacts Menu

Restore your iPod (10 GB) if only 5 GB of the disk capacity is available, or if there is no Contacts menu.
This article has been archived and is no longer updated by Apple.

Symptom

- Only 5 GB of the disk capacity is available even though your iPod has a 10 GB disk.
- There is no Contacts menu, or other features of iPod 1.1 software.

Solution

This issue occurs if you install iPod 1.0.4 or earlier software on an iPod (10 GB), which already has iPod 1.1 or later software installed on it.

1. Download iPod Software 1.1 Updater or later from Apple Software Downloads (http://www.apple.com/swupdates/).
2. Connect iPod to your computer using the FireWire cable that came with iPod.
3. Back up any files data you want to keep from iPod's hard disk.
4. Follow the instructions for restoring iPod as described in technical document 60983: "**iPod: How to Restore**".

Important: Do not use the iPod Software 1.1 Updater to simply update iPod. It must be restored to work correctly.

This document contains frequently asked questions (FAQ) regarding DVD Studio Pro 1.5, with answers to those questions.
This article has been archived and is no longer updated by Apple.

Questions answered in this document

1. What is DVD Studio Pro?
2. Who will want to use DVD Studio Pro?
3. Can I run the DVDs that I make with DVD Studio Pro on the DVD player connected to my TV? What about on my computer's DVD player?
4. Why is DVD Studio Pro the best tool for creative professionals to use for authoring DVDs?
5. How does DVD Studio Pro differ from iDVD?
6. How does DVD Studio Pro make DVD authoring easy for creative professionals?
7. What is the MPEG Encoder and why does it help make DVD Studio Pro easy to use?
8. Can I make both still and motion menus using DVD Studio Pro?
9. Can I add web links to DVDs authored in DVD Studio Pro?
10. DVD audio is encoded in Dolby, but QuickTime is the standard audio format for digital video edited on a computer. Which format works in DVD Studio Pro?
11. Can DVD Studio Pro translate my Final Cut Pro markers into DVD chapter markers?
12. To what formats can I output a project authored in DVD Studio Pro?
13. Which DVD recorders does DVD Studio Pro support?
14. Is there any difference between discs written with the Apple DVD-R drive and those written with the Pioneer DVD-R recorder?
15. I don't have a DVD recorder. How can I burn DVD discs using the content I've authored in DVD Studio Pro?
16. Isn't MPEG encoding slow? What does DVD Studio Pro do to increase encoding speeds?
17. When it comes to working with digital video (DV), what are some of the advantages that Macintosh systems have over Windows-based PC systems?
18. What are 4:3 and 16:9 aspect ratios?
19. What is anamorphic media?
20. When will DVD Studio Pro 1.5 be available?
21. What operating systems support DVD Studio Pro?
22. What software comes with DVD Studio Pro?

Question 1: What is DVD Studio Pro?

Answer: DVD Studio Pro is a new software application from Apple that makes it easy for nonspecialists to author and encode professional-quality DVD-Video discs on their Macintosh desktop. Tight integration with the Apple DVD-R drive on select Power Mac G4 systems makes it easy to record DVDs as well.

Source material can be either QuickTime movies or MPEG streams. DVD projects authored with DVD Studio Pro can include every feature that the DVD-Video standard allows, including up to 99 video tracks, Dolby Digital AC-3 audio, web links, and slide shows.

If you are shooting and editing digital video, you can now retain digital quality and precision from start to finish. With DVD Studio Pro, what was once a very expensive and technical undertaking is now more affordable and much easier than ever before.

Question 2: Who will want to use DVD Studio Pro?

Answer: DVD Studio Pro is designed for creative professionals who work with video and who recognize the quality and durability of DVDs. They include:

- Video production companies
- Video departments in corporations, schools, and advertising agencies
- Independent filmmakers
- Multimedia producers
- Wedding and event photographers
- Training departments in corporations and government organizations
- Sales departments in corporations
- Advanced users of iDVD software who are looking to enhance their DVDs with features that are not available in iDVD

Question 3: Can I run the DVDs that I make with DVD Studio Pro on the DVD player connected to my TV? What about on my computer's DVD player?

Answer: DVDs authored with DVD Studio Pro are fully compatible with the DVD-Video standard. Your DVDs will run on most TV- and computer-based players that are compliant with the DVD-Video standard.

Question 4: Why is DVD Studio Pro the best tool for creative professionals to use for authoring DVDs?

Answer: DVD Studio Pro is in a class by itself because it is the only full-featured, professional DVD authoring tool that is both affordable and easy to use.

- Full featured. DVD projects authored with DVD Studio Pro can include every feature that the DVD-Video standard allows, including motion or still menus, web links, multiple language< tracks, up to 99 video tracks each enhanced with up to 9 different angles, 8 separate audio streams, and 32 subtitle streams.
- Easy to use. DVD Studio Pro is designed to work smoothly with the tools you already use. For example, DVD Studio Pro reads native Adobe Photoshop files directly, making it easy to add great-looking menus, buttons, and overlays. You can also design animated menus using full-motion clips imported from a video editor such as Final Cut Pro. Features such as intelligent pop-up menus help you make the right choices.
- Affordable. At under 1000 USD, DVD Studio Pro can pay for itself in just one project, making DVD authoring affordable to the many professionals who are shooting and editing digital video.

Question 5: How does DVD Studio Pro differ from iDVD?

Answer: DVD Studio Pro gives you access to the entire range of features outlined in the DVD-Video specification. iDVD, on the other hand, gives you just the basic capabilities needed to put video and still images on a DVD. For example, iDVD offers simple, preset menu navigation templates, whereas DVD Studio Pro gives you complete control over the navigation structure. If you want your project to include advanced features such as motion menus, chapter markers, scripting, multiple languages, subtitles, and Dolby Digital audio, you'll want to choose DVD Studio Pro.

Question 6: How does DVD Studio Pro make DVD authoring easy for creative professionals?

Answer: DVD Studio Pro takes what was once a highly technical process and puts it in a context that makes sense for creative professionals. DVD Studio Pro fits nicely into nearly any digital video production environment, such as Final Cut Pro, so you don't need to learn a new editing system in order to author your projects on DVD.

The easy-to-use Apple interface displays all aspects of the project at a glance, and DVD Studio Pro is packed with helpful tools. For example, the Property Inspector helps you make the right choices as you work. Pop-up menus simplify the settings selection process, keeping track of all the details of the DVD-Video standard. Even if you're a beginner, these features can help you be confident that you're making the appropriate choices.

Real-time previews let you see your progress as you work. Competitive DVD authoring tools make you wait for multiplexing or require you to create a disc image. By contrast, the simple preview command in DVD Studio Pro offers instant playback. The complete tutorial and sample files help you work productively right away.

Question 7: What is the MPEG Encoder and why does it help make DVD Studio Pro easy to use?

Answer: DVD Studio Pro comes with an MPEG encoding software plug-in that works within QuickTime-compliant video editing software products such as Final Cut Pro. With a few simple settings you can create high-quality MPEG video files to use in DVD Studio Pro. Purchasing a separate encoder isn't required (although you may want to consider a third-party hardware encoder if you frequently encode large amounts of video material).

Question 8: Can I make both still and motion menus using DVD Studio Pro?

Answer: Yes. Motion menus are video clips designated to function as menus. The clips can be created in a video editor such as Final Cut Pro, then imported into DVD Studio Pro. Still menus are created using images produced in applications such as Photoshop. When working with Photoshop graphics, you can choose which layers are visible at any time without having to flatten or convert the Photoshop files.

Question 9: Can I add web links to DVDs authored in DVD Studio Pro?

Answer: DVDs have a unique advantage over videotape because they can include web links. In DVD Studio Pro, this feature is made possible by Apple DVD@CCESS technology. Web connections let your viewers access late-breaking information that's relevant to the content of your project. They also let businesses create promotional DVDs that link their audience directly to their web store. With web links, salespeople can enhance their presentations by jumping to up-to-date, web-based inventory and pricing details.

Question 10: DVD audio is encoded in Dolby, but QuickTime is the standard audio format for digital video edited on a computer. Which format works in DVD Studio Pro?

Answer: You can use your multichannel QuickTime audio files as the source for encoding into Dolby AC-3 format. Or you can use uncompressed AIFF or QuickTime sound files for stereo audio

Question 11: Can DVD Studio Pro translate my Final Cut Pro markers into DVD chapter markers?

Answer: Yes. Markers placed in Final Cut Pro 3.0.2 can be recognized as either chapter or compression markers when imported into DVD

Studio Pro. This streamlined process makes it easier and faster to place chapter markers at precisely the frame you want.

Question 12: To what formats can I output a project authored in DVD Studio Pro?

Answer: After you complete authoring and testing your project in DVD Studio Pro, the software allows you to output your work in the format that best fits your audience and budget. You can:

- Output your project in DVD-R format and record it using the DVD-R drive on your new Power Mac G4, or deliver it to a DVD service bureau for recording.
- Transfer your project to digital tape and deliver it to a replicator for mass duplication.
- Select DVD-RAM format to record your project using a computer DVD-RAM drive. This is an inexpensive way to test your project before committing it to other media.

Question 13: Which DVD recorders does DVD Studio Pro support?

Answer: DVD Studio Pro supports the Apple SuperDrive available on select Power Mac G4 and iMac systems, as well as a number of external third-party DVD-R drives. Check the DVD Studio Pro website at for the latest information.

Question 14: Is there any difference between discs written with the Apple DVD-R drive and those written with the Pioneer DVD-R recorder?

Answer: Yes. The Pioneer DVR-S201 recorder writes DVD-R Authoring media. These discs can be used as masters for replicating multiple DVD discs. The Apple DVD-R drive writes DVD General media, which are not intended for use as replication masters. If you are creating a project for replication, output your DVD Studio Pro project to digital tape or use a DVD-R Authoring disc as a master.

Question 15: I don't have a DVD recorder. How can I burn DVD discs using the content I've authored in DVD Studio Pro?

Answer: If your Macintosh does not have a DVD-R drive, you can still use DVD Studio Pro to author and test your projects. You can hire a DVD service bureau to create the discs for you. Just output your content onto digital tape or deliver your work on a portable hard drive. You can also output your work onto a DVD-RAM disc, then play it on a computer with a DVD-RAM drive.

Question 16: Isn't MPEG encoding slow? What does DVD Studio Pro do to increase encoding speeds?

Answer: Software-based MPEG encoding has traditionally been a very slow process, taking between 30 and 50 times the length of the source video material. DVD Studio Pro speeds up the process substantially. Included with DVD Studio Pro is Apple's MPEG Encoder plug-in, which is optimized for PowerPC G4 processors with Velocity Engine. This plug-in produces high-quality MPEG files but takes only about 3 times the length of the source video material. If you need higher throughput, hardware-accelerated MPEG encoders that work in real time are available separately.

Question 17: When it comes to working with digital video (DV), what are some of the advantages that Macintosh systems have over Windows-based PC systems?

Answer: Because Apple makes the components of a complete DV system, including the FireWire input technology, the video editing applications, the MPEG Encoder, the DVD authoring tools, and the DVD-R drive, you can be assured that everything works together smoothly. Windows-based PC systems do not offer the plug-and-play ease of Apple's solution. The formats of choice for PC users, Microsoft's AVI and DirectShow, are not able to meet the demands of professional editing.

In addition, all current DV editing applications for the PC require additional hardware. Competitive DV applications also require awkward export rendering and often don't address proper machine control and other issues. During the coming years, these issues may be resolved as other vendors follow Apple's lead. For now, however, Apple is the only company to offer a complete, integrated solution for digital video production.

Question 18: What are 4:3 and 16:9 aspect ratios?

Answer: Standard NTSC and PAL televisions have a picture aspect ratio of 4:3, and many new DV devices support a picture aspect ratio of 16:9. DVD Studio Pro supports the acquisition, creation, and distribution of 16:9 and anamorphic media. On DV devices that have a 16:9 setting, DVD Studio Pro captures and exports the proper 16:9 image.

Question 19: What is anamorphic media?

Answer: Some widescreen video material is shot using a special anamorphic lens that squeezes the wide image horizontally so it can be captured on the standard 4:3 aspect ratio of video. When this material is played back, it needs to be expanded horizontally to match the original shape. DVD Studio Pro can work with this anamorphic material and instructs DVD players to restore the shape on playback.

Question 20: When will DVD Studio Pro 1.5 be available?

Answer: An international English version of DVD Studio Pro will be available worldwide in 2002-04. Please visit the online Apple Store for more information about availability.

Question 21: What are the system requirements for DVD Studio Pro 1.5?

Answer: See technical document 61590: "**DVD Studio Pro 1.5: System Requirements**".

Question 22: What software comes with DVD Studio Pro?

Answer: The DVD Studio Pro package includes a complete package of tools:

- DVD Studio Pro software for authoring and testing DVDs
- QuickTime MPEG Encoder software

DVD Studio Pro 1.5: System Requirements

This document outlines the system requirements for DVD Studio Pro 1.5.
This article has been archived and is no longer updated by Apple.
DVD Studio Pro 1.5 requires the following configuration:

Hardware

- Power Mac G4 computer with Apple-supplied AGP graphics card and DVD drive (configuration must support Apple DVD Player 2.0 or later)
- display with 1024-by-768-pixel resolution or higher (1280-by-1024-pixel resolution recommended)
- 256 MB of RAM (512 MB recommended)
- 12 GB hard disk for project files (20 GB for DVD-5 projects)

Software

- DVD Player 2.7 or later (installed as part of the Mac OS 9 Update to 9.2.2, included on the DVD Studio Pro disc, or with Mac OS X)
- Mac OS 9.2.2 or later (included on the DVD Studio Pro disc)
- Mac OS X 10.1.3 or later
- QuickTime 5.0.5 (included on the DVD Studio Pro disc)

Other

- Video and audio source material in QuickTime or MPEG format (for Dolby encoding, sound files in QuickTime, AIFF, Sound Designer or WAVE formats)
- Graphics editing application for creating menu graphics and overlays (Adobe Photoshop 4.0 or later recommended)
- Final Cut Pro 3.0.2 (required only if you want to access the chapter and compression marker creation feature)

iMac (Flat Panel): Mac OS 9 DVD Player Is Not Installed

The Apple DVD Player for Mac OS 9 may not be preinstalled.

This article has been archived and is no longer updated by Apple.

Symptom

The Apple DVD Player for Mac OS 9 may not be preinstalled.

Solution

Install Apple DVD Player software in order to view movies on DVD-Video discs when the computer is started up in Mac OS 9. You can download Apple DVD Player from Apple Software Downloads (http://www.apple.com/swupdates/) or perform a custom installation of the Apple DVD Player using the Mac OS 9 CD-ROM disc that came with your computer.

For more information on performing a custom installation, see technical document 31288: "Mac OS 9: Installing or Removing Individual Components."

About 1-Click

This document explains 1-Click, which is used with iPhoto and the Apple Store.

This article has been archived and is no longer updated by Apple.

What is 1-Click?

1-Click is a convenient shopping feature that allows you to purchase anything on the Apple Store with single click of your mouse! Activating 1-Click for this computer causes a new button, "Buy with 1-Click", to appear on most product pages. You simply select the products you desire and click the "Buy with 1-Click" button. That's all it takes! Apple will process your order according to the instructions you supply when you turn on 1-Click. 1-Click must be turned on for each computer you desire to use this feature. By activating 1-Click, you indicate that you have read and agree with Apple's Sales and Refunds Policy.

What are 1-Click Settings, and how do I turn 1-Click on and off?

1-Click settings let you set your shopping preferences, allowing you to shop faster and easier at the Apple Store. These preferences include your preferred shipping and payment method. To turn your 1-Click preferences on and off, simply follow the instructions provided in the "Your Account" section of the store.

How do I review or edit my 1-Click settings?

If you wish to edit or change your 1-Click settings you can access your profile in two easy ways.

1. Click on the "Change Your Profile" link in the upper right corner of the Apple Store Home Page, then click on the Change 1-Click Settings section to access the settings for your account.
2. You can also review your settings by accessing the Your Account Section on the main navigation bar At the bottom of your profile, you can turn the 1-Click Settings on and off by selecting the appropriate button in the lower right hand corner of the web page.

How long do I have to change my 1-Click Order?

Items ordered by 1-Click (except for Electronic Software Downloads) will be processed at the end of a 90 minute waiting period. During this period, you will be able to modify and delete your pending 1-Click order.

How Can I review my 1-Click Order?

For each 1-Click order, a thank you page confirming your web order number will be made available to you. On this same page, you can access your 1-Click order by using the "Edit 1-Click Order" button which will take you directly to your pending 1-Click order. In addition, a separate confirmation email is sent to your email address that is registered under your Apple Store Account. You can edit and change your 1-Click order within the 90 minute waiting period.

iPhoto ‘11: Change what happens when you connect a camera to your computer

This article has been archived and is no longer updated by Apple.

When you open iPhoto for the first time, you’re asked if you want iPhoto, or a different application, to open each time you connect a camera to your computer. You can change this preference any time.

To choose the application that opens:

1. Make sure no cameras are connected to your computer.
2. Choose iPhoto > Preferences, and then click General.
3. Choose an option from the “Connecting camera opens” pop-up menu.

   iPhoto is an option. Another option is Image Capture, an application included with OS X that you can use to transfer photos and video from your digital camera to your computer. Image Capture is useful if:

   - You want to transfer photos from your camera to your computer, but you don’t want to import them into the iPhoto or Aperture library.
   - You automate part of your photo-editing workflow with scripts that download and preprocess photos before you import them into iPhoto or Aperture.

iPod: iTunes does not download streaming songs

Learn how to recognize which songs in your iTunes playlists are streaming radio stations, and that cannot, therefore, be downloaded to iPod.
This article has been archived and is no longer updated by Apple.
You can add streaming radio stations to your iTunes music library. These icons are pointers that allow you to quickly tune into a favorite streaming station. Since they reference a radio station, and not a specific song, they cannot be transferred to iPod.

Globe icon for streaming songs

Later versions of iTunes use a broadcast icon for streaming songs

Macintosh: FireWire Issue With Some Canon Mini-DV Cameras

This document describes a FireWire issue that can occur when connecting Canon ZR-40, ZR-45, and ZR-50 Mini DV camcorders. For more information about this issue, please contact Canon, Inc.

This article has been archived and is no longer updated by Apple.

Symptom

When other FireWire devices are connected at the same time as the Canon camera, one or more of the following symptoms can occur:

- Devices unexpectedly disappear from the FireWire bus. For example, FireWire hard drives disappear from the desktop.
- An alert box appears with this message: "The storage device that you just removed was not properly put away before being removed from this computer."
- Video editing software such as Final Cut Pro and iMovie report dropped frames during capture.
- The computer stops responding.

Solution

Try one of the following workarounds:

- Disconnect FireWire devices other than the camera. This step should always alleviate the issue.
- Try a different length or brand of FireWire cable.
- Rearrange the order of devices in the chain.

iPhoto: How to print on perforated or borderless paper

This article has been archived and is no longer updated by Apple.

To print photos on borderless or perforated paper, follow these steps:

1. Choose **File > Page Setup**.
2. Make sure the correct printer is chosen in the **Format for:** pop-up menu.
3. Select 4x6 as the paper size, and click OK.
4. Select the photos you want to print.
5. Click Edit.
6. Constrain your selection to 4x6. Choose the 4x6 ratio from the Constrain pop-up menu before dragging to enclose the desired area.
7. Position the arrow pointer at one corner of the area you want to select, then drag to enclose the desired area.
8. Click the Crop icon in the Edit pane.
9. Choose **File > Print**.
10. In the print dialog window, choose Full Page from the **Style:** pop-up menu.
11. Click Print.

Note: Some Epson models may require these additional steps before step 11:

1. Click Advanced Options in the print dialog.
2. Select Print Settings in Advanced Options of the Print dialog.
3. Select Ink Jet Postcard from Media Type menu. (Plain Paper is selected as default in Media Type menu.)

If you are using iPhoto 6 or later, you may also be able to use the following steps, which do not require you to pre-crop the photo:

1. Choose **File > Print**.
2. Choose your printer from the **Printer** pop-up menu
3. Choose Standard from the **Presets** pop-up menu
4. From the **Paper** pop-up menu, choose the paper size you currently have in the printer (such as 4x6 Photo Paper).
5. Choose Standard Prints from the Style pop-up menu.
6. Choose the print size which closely matches the paper size you are using from the **Size** pop-up menu (such as 4x6).
7. Choose one photo per page.
8. Select zoom and crop.
9. Select Borderless.
10. Click Print.

iPod: Do Not Connect or Disconnect While Burning a CD Using an External FireWire Burner

An external FireWire CD-RW drive may not successfully create a CD if you connect or disconnect iPod while the CD is being burned.
This article has been archived and is no longer updated by Apple.

Symptom

An external FireWire CD-RW drive may not successfully create a CD if you connect or disconnect iPod while the CD is being burned.

Solution

Wait until the CD has been created before connecting or disconnecting iPod (if using an external FireWire-based CD-RW drive).

DVD Player 3.0: "This machine configuration is not supported. The application will now quit." Alert

Mac OS X 10.1.5 requires DVD Player 3.1 or later.
This article has been archived and is no longer updated by Apple.

Symptom

When you open DVD Player an alert box with this message appears:

> "This machine configuration is not supported. The application will now quit."

Solution

Download and install DVD Player 3.1.1 or later from Apple Software Downloads (http://www.apple.com/swupdates/).

Final Cut Pro: How to Use Analog/FireWire Converter Devices

This document explains how to use devices that convert analog video to or from DV over FireWire (IEEE 1394) with Final Cut Pro.

This article has been archived and is no longer updated by Apple.

You can convert analog video formats such as Betacam SP, 8 mm, Hi8, VHS, or SVHS to digital video (DV) using a special converter device such as the Sony DVMC DA-2, Hollywood Dazzle DV Bridge, and the Synchrotech Formac Studio. These devices are a convenient way to interoperate with Final Cut Pro when the video deck you are working with does not input or output video via FireWire.

To ensure compatibility with third-party video devices please consult the Final Cut Pro certified devices page (http://www.apple.com/finalcutpro/qualification.html), the Apple Store (http://www.apple.com/store/), and/or vendor Web sites for compatibility information.

Note: These procedures describe connecting an analog/FireWire converter box while not using any sort of device control, which is the most common configuration. For instructions on using device control, see the documentation that came with the converter box and the Final Cut Pro user's documentation.

How to Capture Analog Video From a Converter Box Into Final Cut Pro

Follow these steps to capture video from an analog/FireWire converter box:

1. The computer and the converter box should both be turned on. However, Final Cut Pro should not be opened yet and the converter box should not be connected to the computer using the FireWire cable. While this step is not always necessary, it will help ensure proper initialization between the software and hardware.
2. Connect the video cable from the video output of the VCR or camera to the analog video input of the converter box. A video camera should be in playback or VTR mode. Connect the audio source in the same way.
3. The converter box will typically have a switch or button that tells the device which direction to convert the video, analog to DV or DV to analog. For capturing analog video, you will want to press the button labeled "Analog In" or something similar.
4. Connect a 4-to-6 pin FireWire cable from the DV out port on the converter box (sometimes labeled FireWire, IEEE 1394, or iLink with Sony devices) to a FireWire port on the computer.
5. Open Final Cut Pro.
6. Select Log and Capture from the File menu or press Command-8 on the keyboard. You may see an alert box with a message stating that the video deck could not be initialized. This just indicates that the converter box does not work with device control.
7. Click the Capture Settings tab on the right side of the Log and Capture window.
8. Choose Non-Controllable Device from the Device Control pop-up menu. If you plan on capturing from a converter box often, you may want to make this setting the default from the Final Cut Pro menu (File menu in Mac OS 9) -> Audio/Video Settings -> Summary Tab -> Device Control Preset pop-up menu.
9. Some converter boxes have a status light that is normally green. If this light is amber or red at this point, there may be a communication issue. Try turning the device off for several seconds and then back on again. You may also need to reopen Final Cut Pro.
10. Press play on the VCR. You should see the video signal in the Log & Capture window. If you have speakers or headphones connected to the VCR or camera then you can monitor the audio.
11. Cue the video tape to the desired spot and click Capture Now in the bottom right portion of the Log and Capture window. By default Capture Now is limited to 30 minutes of captured video. To change this setting, select Final Cut Pro menu (or File menu in Mac OS 9) -> Preferences -> Scratch Disks.

How to Send Video From Final Cut Pro to the Converter Box

Follow these steps to output video from Final Cut Pro to an analog video deck using an analog/FireWire converter box:

1. The computer and the converter box should both be turned on. However, Final Cut Pro should not be opened yet and the converter box should not be connected to the computer using the FireWire cable. While this step is not always necessary, it will help ensure proper initialization between the software and hardware.
2. Connect the video cable from the analog video output of the converter box to the video input of the VCR or camera. Connect the audio source in the same way.
3. The converter box will typically have a switch or button that tells the device which direction to convert the video, analog to DV or DV to analog. For exporting analog video from Final Cut Pro, you will want to press the button labeled "DV In" or something similar.
4. Connect a 4-to-6 pin FireWire cable from the DV in port on the converter box (sometimes labeled FireWire, IEEE 1394 or iLink with Sony devices) to a FireWire port on the computer.
5. Open Final Cut Pro.
6. Select Audio/Video Settings from the Final Cut Pro menu (or File menu in Mac OS 9).
7. In Final Cut Pro 3 click the External Video tab. In Final Cut Pro 4 click the A/V Devices tab.
8. Choose the appropriate output setting for the device you are recording to in the View During Playback Using and View During Recording Using pop-up menus. For example, in North America and Japan this would typically be "Apple FireWire NTSC (720x480)".

9. Make sure that the View->External Video menu is set to All Frames.
10. Select Print to Video from the File menu or press Control-M on the keyboard.
11. In the Print to Video window, configure settings such as leader, trailer, and color bars and then click OK.
12. Wait for Final Cut Pro to render any necessary audio or video (a progress dialog will appear if needed).
13. Press record on the VCR and click OK.
14. When finished, press stop on the VCR and Esc on the computer keyboard.

iMovie: Use 16-bit audio for best results

Creating iMovie projects with DV footage that uses 12-bit audio may cause a gradual loss of audio/video synchronization when the project is exported to QuickTime or iDVD.
This article has been archived and is no longer updated by Apple.

For best results when creating long movies (over 20 minutes), record footage using 16-bit audio. Recording with 12-bit audio may result in a gradual loss of audio-video synchronization. Check the manual that came with your DV camcorder to find out how to set the audio format.

If you have already created a project with 12-bit audio, you may be able to export the project to QuickTime as follows:

1. Import your 12-bit video footage into a new iMovie project.
2. Insert a fresh tape into your camera, and set the camera to 16-bit audio.
3. Export the iMovie project that contains the 12-bit audio footage to your DV camcorder set to 16-bit audio.
4. Create another new iMovie project.
5. Import the fresh footage from your new tape into this new iMovie Project.
6. Export this project to QuickTime if needed or simply edit the project.

This includes versions of iMovie for Mac OS X and Mac OS 9.

iPod: Playing Music Files That Contain Data and Resource Forks

When playing a music file that contains a resource fork, iPod may play a small section from a random song after first song ends.
This article has been archived and is no longer updated by Apple.

Symptom

When playing a music file that contains a resource fork, iPod plays a small section of a random song after the first song ends.

Solution

To work around this behavior, you can either re-encode your music files using iTunes, or you can try the following steps for each affected file:

1. Select the file in the Finder.
2. Choose Show Info (Mac OS X) or Get Info (Mac OS 9) from the File Menu.
3. Click the icon for the file in the Info window.
4. Press Delete on the keyboard, or type Command-X to cut the icon.

Additional information

Music data in files, including MP3 files, contain all the audio data within a part of the file called the "data fork." Some earlier MP3 encoder applications embedded custom icon data into MP3 files, to identify them with the application. In some cases, this causes iPod to continue reading past the end of the actual music data. You might hear a portion of another song, which is the data that happens to be adjacent on iPod's hard drive to the data from the first song.

iBook (16 VRAM): Battery Level Shows More Than 100 Percent

Under certain conditions, iBook (16 VRAM) and iBook (Opaque 16 VRAM) computers may indicate battery charge levels as being more than 100 percent, sometimes up to 106 percent, for a short period of time.

This article has been archived and is no longer updated by Apple.

Symptom

The battery level indicator in the menu bar shows a percentage greater than 100 percent.

Solution

This does not mean that the battery is faulty. Numbers reported as greater than 100 percent are equivalent to a 100 percent charge.

Final Cut Pro 3: When to Install the 3.0.1 Update

This document describes when and how to install the Final Cut Pro 3.0.1 update.

This article has been archived and is no longer updated by Apple.

Symptom

The Final Cut Pro application unexpectedly quits after installing the 3.0.2 update.

OR

Alert boxes with erroneous "missing system ID" messages appear after installing the Final Cut Pro 3.0.2 update.

Solution

Download and install the Final Cut Pro 3.0.1 Updater. It is available from Apple Software Downloads (http://www.apple.com/swupdates/).

If you have already installed the 3.0.2 update, drag these files to the Trash:

- /Applications/Final Cut Pro
- /Library/Application Support/Final Cut Pro System Support/

How to Install the 3.0.1 Update

1. Install the 3.0.1 update
2. Open and run the Final Cut Pro 3 full installer
3. Install the the 3.0.4 update

Note: The 3.0.4 update supersedes the 3.0.2 update.

Frequently Asked Questions

Q: I have already installed the 3.0.4 update. Do I still need to install 3.0.1?

A: If you have successfully installed the 3.0.4 update, you do not need to install the 3.0.1 updater. However, if you cannot complete the full installation or the 3.0.4 update, follow the instructions in How to Install the 3.0.1 Update.

Q: Why doesn't the 3.0.4 updater include the fixes in 3.0.1?

A: It does. However the 3.0.4 updater is not a full installer so some customers still need to run the Final Cut Pro 3.0 installer from the CD before running the updater. Installing the 3.0.1 update before running the 3.0 installer ensures that the installer will not quit unexpectedly.

Q: Why do I run the 3.0.1 updater before installing 3.0?

A: The 3.0.1 updater doesn't actually install or change the Final Cut Pro application. Instead, it installs and correctly prepares some of the support files so that the full installation can complete normally.

Q: My Final Cut Pro 3 CD has version 3.0.2 on it, not 3.0. Do I need to install the 3.0.1 updater?

A: No. The 3.0.2 full installer is not susceptible to the issue.

Xserve: Initial Password Is Case Sensitive

When you first set up Xserve you must enter a password in the password field, which is case sensitive. The initial password is the first 8 digits of the hardware serial number.
This article has been archived and is no longer updated by Apple.
For the initial setup of an Xserve using Server Assistant or remote SSH login, the documentation instructs the administrator to use the first 8 characters of the hardware serial number as the password.

The password is case sensitive. If the server's serial number is "ABC123H2" and "abc123h2" is entered, an alert appears with a message that the password is invalid.

Mac OS X 10.1: About Improving SMB File Transfer Speed with cp or CpMac

This document explains how you can enhance the file transfer rate when copying files between Mac OS X and a SMB file server volume, using Terminal and cp or CpMac (CpMac is included with Developer Tools). This document is needed only for Mac OS X versions 10.1 to 10.1.5. This article has been archived and is no longer updated by Apple.
Mac OS X permits normal file transfers with SMB server volumes via the Finder. For information about accessing an SMB server, see technical document 106471: "**How to Connect to an SMB Volume (Microsoft Windows)**".

When transferring very large files, you may wish to enhance file transfer rates by using cp or CpMac, which is included with Developer Tools. You must install the complete Developer Tools package to use CpMac.

CpMac is required before using Terminal to copy any application or file with a resource fork.

Follow these steps to install CpMac. (You only need to do this one time.)

1. Insert the Mac OS X Developers Tools CD. **Note:** If you do not have access to a Developer Tools CD, a CD image is available from the Apple Developer Connection (http://www.apple.com/developer/).
2. Double-click "Developer.pkg"
3. When the Installer window appears, click the padlock button and enter your Admin password.
4. Install Developer Tools. **Note:** 513 MB of disk space is required for installation

Copying file(s) using Terminal

if you are copying files that do not have resource forks, such as plain text files, you should use cp. If you are copying files that have resource forks, or if you are not sure, you should use CpMac. Instructions for both commands follow.

Copy files using cp

1. Open Terminal.
2. Type: `cp <source file location> <target location>/<name of file>`
3. Press Return.

Example: You would use this single Terminal command to copy a file named "List.txt" from the Home directory of a user name "Jane" to a folder named "Janes" on an SMB volume named "SMB_stuff":

```
% cp [space] /Users/Jane/List.txt [space] smb://SMB_stuff/Janes/List.txt
```

Copy files using CpMac

1. Open Terminal.
2. Type: `/Developer/Tools/CpMac <source file location> <target location>/<name of file>`
3. Press Return.

Example: You would use this single Terminal command to copy a file named "List.txt" from the Home directory of a user name "Jane" to a folder named "Janes" on an SMB volume named "SMB_stuff":

```
% /Developer/Tools/CpMac [space] /Users/Jane/List.txt [space] smb://SMB_stuff/Janes/List.txt
```

Note: This article contains information about Apple Developer Tools software. AppleCare does not provide usage support for Apple Developer Tools software. Paid support for Apple Developer Tools software is available at http://developer.apple.com.

Mac OS X 10.1: Video on VGA Monitor Connected to a PowerBook G4 Is Garbled

If you connect a VGA monitor to your PowerBook G4 computer and do not click "Detect Displays" in the Displays pane of System Preference Pane (or choose the same command from the menu bar extra) the video on the monitor may be garbled.
This article has been archived and is no longer updated by Apple.

Symptom

When you connect a VGA monitor to your PowerBook G4 computer and do not click "Detect Displays" in the Displays pane of System Preference Pane (or choose the same command from the Displays menu bar extra) the video on the monitor may be garbled.

Solution

Download and install Mac OS X 10.1.4 or later. It is available from the Software Update pane of System Preferences, or from Apple Software Downloads (http://www.apple.com/swupdates/).

Temporarily, you may resolve the issue by using one of these methods:

- Click Detect Displays in the Displays pane of System Preferences
- Choose Detect Display from the Displays menu bar extra
- Choose Sleep from the Apple menu, then press a key to wake the computer
- Choose Restart from the Apple menu.

QuickTime: MPEG-2 Playback Component Download and Installation Instructions

This article has been archived and is no longer updated by Apple.

This document outlines steps you can take to troubleshoot the installation of the MPEG-2 Playback Component once you have purchased it from the Apple Store.

Download instructions

1. Make sure QuickTime or QuickTime Pro is already installed on your computer.
2. Purchase the MPEG-2 Playback Component from the Apple Store (http://www.apple.com/store/).
3. Click Download to begin downloading the software.

Troubleshooting downloads

Some Web browsers may not recognize the file type of the MPEG-2 Playback Component. If this is the case, after you click Download, a dialog box appears with a message that asks you what you would like to do with the file. You should choose to download it, or open it with QuickTime Updater if that option appears. Once downloaded, you can double-click the file to install it.

The Apple Store keeps track of your purchase(s) and you can always download the file again if something goes wrong by clicking "Your Account" in the store menu bar. After entering your Apple ID and password, click "Software Download Purchases."

Installation instructions

Once the software is downloaded it should automatically install via the QuickTime Updater if you have Windows. If not, see the troubleshooting section below.

If you have Mac OS X, follow these steps:

1. Locate the QuickTimeMPEG2.pkg file. It is probably on your desktop, or in the default "downloads" folder you designated in your Web browser.
2. Double-click the file to begin installation.

Troubleshooting installation

If the MPEG-2 Playback Component does not automatically install in Windows, follow these steps:

1. Locate the QuickTimeMPEG2.qup file. It is probably on your desktop, or in the default "downloads" folder you designated in your Web browser.
2. Double-click the file to begin installation.

QuickTime 6: Instant On Streaming Does Not Work

This document explains why the Instant On streaming feature of QuickTime 6 may not work.

This article has been archived and is no longer updated by Apple.

Symptom

The Instant On streaming feature does not work.

Solution

1. Open the QuickTime Settings control panel (Mac OS 9, Windows) or the QuickTime pane of System Preferences (Mac OS X).
2. Make sure the Instant On setting is enabled.
3. Make sure the Connection Speed setting is set to "112 Kbps Dual ISDN/DSL" or faster. Instant On streaming doesn't work with slower connections.

Other reasons why Instant On streaming may not work:

- The stream is being sent from a version of QuickTime Streaming Server (or Darwin Streaming Server) earlier than version 4.1.
- The stream comes from a QuickTime Streaming Server (or Darwin Streaming Server) with version 4.1, but the administrator has disabled the Instant On streaming feature.
- Your Internet connection is 56 kbps or slower.
- When you open a streaming movie, QuickTime determines your connection speed is too slow to work with Instant On.

Published Date: Feb 19, 2012

QuickTime 6: Instant On Works With Some Movies, but Not Others

Some movies may not begin playing as quickly as expected using Instant On streaming if they were encoded with the QDesign audio codec.

This article has been archived and is no longer updated by Apple.

Symptom

Instant On streaming works with some movies, but other movies only begin to play after a few seconds.

Solution

Some movies may not begin playing as quickly as expected during Instant On streaming if they use the QDesign audio codec. This is due to a built-in buffer delay that is a feature of the codec.

QuickTime 6: Installation Fails If "QuickTime Extensions" Folder Is Missing

Create a new folder called "QuickTime Extensions" in the Mac OS 8 or Mac OS 9 Extensions folder if QuickTime 6 will not install.

This article has been archived and is no longer updated by Apple.

Symptom

QuickTime 6 won't install. An alert message will appear, "This installation requires a System Folder on the destination drive".

Solution

1. Open the System Folder.
2. Open the Extensions Folder
3. Choose New Folder from the File menu.
4. Type: QuickTime Extensions
5. Press Return. The new folder should be titled QuickTime Extensions.
6. Install QuickTime 6.

Published Date: Feb 19, 2012

QuickTime 6: System Requirements

This document outlines the system requirements for QuickTime 6.

This article has been archived and is no longer updated by Apple.

Macintosh

- A PowerPC microprocessor-based Macintosh computer.
- At least 32 MB of RAM
- Mac OS 8.6 or later; or Mac OS X 10.1.3 or later

Windows

- A Pentium microprocessor-based PC or compatible computer
- At least 32 MB of RAM
- Windows 98/NT/Me/2000/XP
- A Sound Blaster or compatible sound card and speakers recommended
- DirectX version 3.0 or later recommended

Note to QuickTime Pro Users
QuickTime 6 replaces earlier versions of QuickTime. A QuickTime 6 Pro key is required to unlock Pro features of QuickTime 6. If you wish to use a QuickTime 4 or 5 Pro key, you need to use an earlier version of QuickTime, which you can download from the Apple Support Web site (http://www.info.apple.com/usen/QuickTime/).

iTunes: How to Turn Off "Copy files to iTunes Music folder when adding to library" Option

This document explains how to keep iTunes 3 and iTunes 4 from copying music files to the iTunes Music folder when you add them to the library.
This article has been archived and is no longer updated by Apple.
Follow these steps to keep iTunes 3 and iTunes 4 from copying music files to the iTunes Music folder when you add them to the library:

1. Choose iTunes > Preferences.
2. Click Advanced.
3. Click "Copy files to iTunes Music folder when adding to library" to deselect that option.
4. Click OK.

Published Date: Oct 7, 2016

iTunes 3: Join CD Tracks Command Is Dimmed

iTunes 3 can join CD tracks to eliminate gaps between songs only before the song has been encoded or "ripped."
This article has been archived and is no longer updated by Apple.

Symptom

The Join CD Tracks command in the Advanced menu is dimmed.

Solution

You can only join tracks before they are encoded or "ripped". You cannot join songs after they have been encoded.

To join two or more tracks, they must be sequential. For example, you can join tracks 2 and 3 from an audio CD, but you cannot join tracks 3 then 2. Follow these steps:

1. Insert the CD with the songs you want to join.
2. Select the CD from the iTunes Source list.
Note: Make sure the list is sorted by track number.
3. Select the adjacent tracks you want to join.
4. Choose Join CD Tracks from the Advanced menu.
5. Click Import.

Important: iTunes software may be used to reproduce materials. It is licensed to you only for reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce. If you are uncertain about your right to copy any material you should contact your legal advisor.
Published Date: Oct 7, 2016

iTunes 3: Genre Does Not Appear in Browser Window

You must turn on the "Show genre when browsing" option to see the Genre column in the iTunes 3 browser.
This article has been archived and is no longer updated by Apple.

Symptom

When you click Browse (or choose Browse from the Edit menu), only the Artist and Album columns appear. the Genre column doesn't appear.

Solution

1. Choose Preferences from the iTunes menu.
2. Click General (if necessary).
3. Click the checkbox to select the "Show genre when browsing" option.
4. Click OK.

iTunes 3: System Requirements

This document outlines the system requirements to use iTunes 3.
This article has been archived and is no longer updated by Apple.
To use iTunes 3, your computer must have:

- Mac OS X 10.1.4 or later
- built-in USB ports
- 400 MHz G3 processor or better recommended
- 256 MB RAM recommended

Published Date: Oct 7, 2016

iTunes 3: About Moving the iTunes Folder to Your Music Folder

When you first open iTunes 3, a dialog box appears with a message that asks you if you want to move the iTunes folder to the Music folder in your Home directory.
This article has been archived and is no longer updated by Apple.
When you first open iTunes 3, a dialog box appears with this message appears:

> "iTunes has detected an existing iTunes folder in your Documents folder. Would you like to move this folder to your Music folder? This will not affect playback of your music in iTunes."

If you click Yes, iTunes will move the iTunes folder in your Documents folder to the Music folder in your Home directory. This includes all the music that you have encoded (as long as the iTunes Music folder is in the iTunes folder). iTunes doesn't copy the folders. It simply moves them. No extra disk space is required.

If you click No, iTunes will continue to work with the iTunes folder in your Documents folder.

Final Cut Pro 3: Serial Device Control With Panasonic AJ-D250

When using Final Cut Pro 3 with the Panasonic AJ-D250 deck, you may experience an issue where RS-232 device control does not work.

This article has been archived and is no longer updated by Apple.

Symptom

The deck does not respond to transport commands (play, pause, and so forth) sent from Final Cut Pro. The ETT or Log & Capture window says "No communication" instead of "VTR OK".

Solution

Turn the VTR deck off and back on again. The ETT or Log & Capture window in Final Cut Pro should now say "VTR OK".

iPod 1.2: Screen Says "Do Not Disconnect" If You Restore Using iPod 1.1 Software

You can disconnect iPod from your computer to finish installing iPod 1.1 software if you decide to reinstall it after having already installed iPod 1.2 software.

This article has been archived and is no longer updated by Apple.

Symptom

iPod's screen says "Do Not Disconnect" after you restore using iPod 1.1 Software Updater, but the updater says to disconnect to finish the installation.

This only occurs if you have already installed iPod 1.2 software.

Solution

You can safely disconnect iPod to finish the installation.

iPod 1.2: How to Change Contact Display and Sort Settings

This document explains how to change the display and sort settings for contacts in iPod Software 1.2.
This article has been archived and is no longer updated by Apple.
iPod Software 1.2 introduces the ability to change two settings for contacts:

- sort order
- display order

Sort order

The sort order affects how the list of contacts is sorted in the Contacts list. You can choose between two settings for names:

- First Last
- Last, First

Follow these steps to change the Sort order setting for iPod's contacts:

1. Select Settings from the main menu.
2. Select Contacts from the Settings menu.
3. Select Sort from the Contacts menu.
4. Press the Select button to toggle between the two settings.

Display order

The Display order setting affects how the list of contacts is viewed. You can choose between two settings for names:

- First Last
- Last, First

Follow these steps to change the Display order setting for iPod's contacts:

1. Select Settings from the main menu.
2. Select Contacts from the Settings menu.
3. Select Display from the Contacts menu.
4. Press the Select button to toggle between the two settings.

Using Audible spoken word files with iPod

This article has been archived and is no longer updated by Apple.

Learn how iPod software works with Audible spoken word files.

iPod 1.2 software and later can play Audible spoken word files, which are easily recognized by their filename extension: ".aa".

Tip: All audio books purchased from the iTunes Store are Protected AAC files recognized by the filename extension "m4b".

You can purchase spoken word content from the iTunes Store, or from audible.com.

Audible Formats

When you purchase a book from Audible, depending on the title, you may be able to download it in several different formats. iPod only works with Audible 2, 3, and 4 formats. The different formats are designed for different purposes as outlined here.

Format 2

Designed for maximum compression and smallest file size. The sound quality is the poorest of the formats, but allows you to store more books in the same amount of space.

Format 3

Designed for best quality and compression for spoken voice recordings.

Format 4

This is an MP3 compression of the spoken voice recording, but in the .aa format so iTunes and iPod can use bookmarks. This format usually results in a larger file than Format 3, so it may not be the best format for spoken voice recordings that don't have any music.

If the sound quality of an Audible file on iPod is not to your liking, you may want to download it in a different format if one is available.

Apple does not provide support for using the Audible website or with the quality of the Audible files. For assistance with Audible spoken word files contact Audible. If you purchased an audiobook from the iTunes Store and need help, contact us.

Bookmarks

iPod 1.2 software and later works with the bookmark feature of Audible files. If you stop or pause an Audible file, it will automatically bookmark that spot. The next time you play that file it will start playing from the bookmarked spot.

Bookmarks sync to and from iTunes. Whichever bookmark is further along in iPod or iTunes becomes the effective bookmark.

Bookmarks work with both Audible files (with .aa file extension) and Audio Books purchased from the iTunes Store (with .m4b file extension). If you have an audio book or spoken word file in any other format, such as MP3, click here for information on the remember playback position feature in iTunes 5 or later.

Three Computers Per Account

Audible's licensing agreement allows you to play the files you have purchased on three different computers. On each computer you can authorize your Audible account with iTunes by adding the files to iTunes or by playing them in iTunes if you previously deauthorized your account. You can download and listen to your spoken word files on all three computers. iPod does not count as one of the three computers.

Two Accounts Per iPod

iPod does not count as one of the three computers in Audible's licensing agreement, but you may only download books from two different Audible accounts to your iPod.

If you try to download an Audible file purchased with a third Audible account, iTunes will not synchronize the file, and this message will appear:

> "Some of the Audible Files in the iTunes music library were not copied to the iPod "iPod" because an iPod may only contain content from two Audible accounts."

If you manually manage your iPod's songs and playlists, you won't be able to copy a file from a third account to your iPod either. No message will appear to explain why the file doesn't copy.

TA26591_Using_Audible_spoken_word_files_with_iPod.pdf

Audible and Earlier Version of iTunes

Some customers may experience an issue where they receive the error message above when trying to sync Audible.com content to their iPod even if they do not have content from more than two accounts on the iPod. This issue may be resolved by updating to the latest version of iTunes and making sure that your your computer is authorized to play the content being synced as described above.

Power Mac G4 (Mirrored Drive Doors): Does Not Wake From Sleep With Radeon 9000 Pro Graphics Card

A Power Mac G4 (Mirrored Drive Doors) computer with an ATI Radeon 9000 Pro graphics card installed may have difficulty waking from sleep. This article has been archived and is no longer updated by Apple.

Symptom

When you press a key on the keyboard, or move the mouse to wake the computer, it may briefly wake up, but then unexpectedly goes back into sleep.

This issue occurs when one of the following is connected to the display card's DVI port:

- a monitor with a DVI-style connector
- a VGA monitor using a DVI to VGA adapter
- a DVI to VGA adapter that does not have a monitor connected to it

Solution

Update to the latest version of Mac OS X.

To download and install an update via the automatic Software Update feature in Mac OS X, choose System Preferences from the Apple menu, choose Software Update from the View menu, then click Check Now. Any available updates will be listed in Software Update.

If the behavior persists after updating to a current version of Mac OS X, the issue may be related to the configuration outlined in technical document 86219, "**Power Mac G4, Power Mac G5: Computer Restarts After Being Shut Down**". Follow the steps in that document to see if they resolve the issue.

Note: To restart the computer hold in the Power button, until the computer shuts down. Press the power button again to start. If holding the power button does not turn off the computer, turn off the power on the wall switch or remove the power cable from the back of the computer.

iPod 1.2: No Longer Plays Audible Spoken Word Files

If you connect iPod with version 1.2 of iPod software to a computer with iTunes 2, it will no longer be able to play Audible spoken word files.
This article has been archived and is no longer updated by Apple.

Symptom

After you connect iPod to a computer with iTunes 2 installed, it no longer plays Audible spoken word files.

Solution

Connect iPod to the computer you used to download the Audible files to iPod with iTunes 3. Once iPod appears in the Source List, it will be able to play Audible files, but you will need to copy the Audible files to iPod again.

QuickTime 6: Embedded URLs May Not Work

When using QuickTime 6 in Mac OS X you may encounter an issue where embedded URLs do not work correctly. These URLs could be a QTVR hot spot, a sprite, or imported as part of a text track.

This article has been archived and is no longer updated by Apple.

Symptom

When you click an embedded URL in a QuickTime movie, a Finder window opens instead of a Web page.

Solution

Download and install QuickTime 6.0.2 or later. It is available from the QuickTime website (http://www.apple.com/quicktime/). You may also download and install it using the QuickTime pane of System Preferences.

Published Date: Feb 19, 2012

iPod: Short delay for calendars to appear

This article has been archived and is no longer updated by Apple.

Sometimes a calendar event may not immediately appear on your iPod screen when you select Extras > Calendars. This delay occurs when iPod is still loading calendars. This can happen with any iPod model (including iPod, iPod photo, and iPod mini) that has the Calendar feature, and can occur after you've synced iCal calendars to your iPod with iSync, or manually copied this information to your iPod.

You may experience a short delay after you first copy or sync a large number of contacts and calendar events, or after you reset iPod. When iPod first loads a large number of contacts, it displays a progress indicator before displaying the contacts. However, iPod does not display a progress indicator when it loads a large number of calendar items. Instead, just wait about 10 seconds and then try to view your calendars again.

Published Date: Oct 7, 2016

Manually adding your calendars to iPod‘s Calendars list

This article has been archived and is no longer updated by Apple.

The easiest way to add your iCal calendars to iPod's Calendars list is to use iTunes, but you can manually add it if you want. To find out how to sync calendars with iTunes click here.

Update iPod

Update your iPod with the latest software for your model.

Export your calendar in iCalendar format

1. Open iCal.
2. Select the calendar you want to export from the Calendars list.
3. From the **File** menu, choose **Export**.
4. Type a filename in the field when prompted.
5. Click Export.

Copy the iCal (.ics) file to iPod

1. Make sure iPod is set up to be used as a hard disk you can store files on.
2. Connect iPod to your computer using the cable that came with it.
3. Double-click the iPod icon on the desktop or in a Finder window.
4. Drag the .ics file you saved earlier to the Calendars folder on your iPod.
5. Disconnect iPod from your computer.
6. Select Extras from the iPod menu.
7. Select Calendars.
8. Select the calendar you wish to view.

Days with events have a bullet (·) in the day cell. Scroll through the calendar and select a day to view its events.

Events with alarms you create in iCal also work on your iPod.

iCal 1.0: Date in Dock Icon Does Not Update at Midnight

When you open iCal, the icon in the Dock reflects the current date. If you leave iCal open overnight, the icon does not update at midnight to reflect the change of date.

This article has been archived and is no longer updated by Apple.

Symptom

The date in the iCal application icon is not updated in the Dock.

Solution

Update to iCal 1.0.2 or later.

Published Date: Oct 7, 2016

iCal 1.0: Only Works With Mac OS X Mail Application

iCal 1.0's email-dependent features, including meeting invitations and email reminders, only work with the Mac OS X Mail application.
This article has been archived and is no longer updated by Apple.

Symptom

- When you send an email invitation, an alert box appears and the invitation is not sent.
- When you receive an email invitation and click on the link to add it to your calendar, an alert box appears.

Solution

iCal 1.0 only works with the Mac OS X Mail application. To send or receive invitations, make sure the Mail application is set up to send and receive email.
Published Date: Oct 7, 2016

Using iCal with Microsoft Entourage

iCal and the calendar feature of Microsoft Entourage can be used together--as long as you have iCal 1.5 or later and Mac OS X 10.3.5 or later installed.
This article has been archived and is no longer updated by Apple.
If you have earlier versions of iCal or Mac OS X, when you try to add an iCal invitation to an Entourage calendar, an alert box with an error message could appear; an Entourage invitation received with the Mac OS X Mail application could appear as plain text instead of as an attachment; or, when you try to import or add an .ics file from Entourage into iCal by double-clicking the file's icon, an alert box might appear.

Simply use iCal 1.5 or later and Mac OS X 10.3.5 or later to avoid these issues.
Published Date: Oct 7, 2016

iCal meeting invitees aren‘t notified if you delete an event

If you invite guests to an event in your iCal 1.0 calendar and later remove that event, the invited guests are not notified.

This article has been archived and is no longer updated by Apple.

Notify guests that the event has been canceled by other means, such as email.

Final Cut Pro 3: Voice Over Tool Reports No Available Sound Input Devices

This document describes an issue with Final Cut Pro 3 for Mac OS X. On late-model computers, you may see an alert box when trying to use the Voice Over tool.

This article has been archived and is no longer updated by Apple.

Symptom

When you choose Tools > Voice Over, an alert with this message appears :

> "No sound recording devices are available. They may be in use by another application, incorrectly connected or may be conflicting with a video output device."

Solution

1. Download and install Mac OS X 10.2.3 or later, which is available from the Software Update pane of System Preferences, or from Apple Software Downloads (http://www.apple.com/swupdates/).

2. Ensure you are using QuickTime 6.1 or later.

Mac OS: Alert Message When Opening Microsoft Outlook Express 5

An alert appears when opening Microsoft Outlook Express version 5.0 or later.
This article has been archived and is no longer updated by Apple.

Symptom

An alert box with one of the following messages appears when opening Microsoft Outlook Express:

"An error has occurred. Unexpected end of file. "

"Memory is full."

"An unknown error 4359 occurred."

Solution

You may find a solution for this issue at the Microsoft Knowledge Base (http://support.microsoft.com/default.aspx?scid=KB;EN-US;Q296844).

Using analog/FireWire converter devices with iMovie

Learn how to use devices that convert analog video to or from DV over FireWire (IEEE 1394) with iMovie.
This article has been archived and is no longer updated by Apple.
You can convert video in 8 mm, Hi8, VHS, or SVHS format to digital video (DV) format, using a special converter box (sometimes referred to as AV adapters), such as the Sony DVMC-DA2 or the Synchrotech Formac Studio.

If you use a converter to import non-DV video, you can't control your camera or deck with iMovie. However, you can manually control the camera to import video clips and use all of iMovie's editing features, then export your video through the converter back to your video recorder or camera.

A converter of this kind will generally have standard S-video and RCA input/output ports for video and audio, and a FireWire or iLink (IEEE 1394) input/output port. Make sure you have the appropriate cables for your configuration.

To ensure compatibility with third-party video devices, check the iLife Camcorder Compatibility page, the Apple Store, and/or vendor websites for compatibility information.

For more information, check the documentation that came with your converter.

Capturing Analog Video From a Converter Box Into iMovie

Follow these steps to import video from an analog-to-FireWire converter device. While this specific order may not be necessary with all converters, it will help ensure proper initialization between the hardware and software:

1. Start up your computer, turn on the converter box, and connect the computer to the converter with a FireWire cable.
2. Connect the video cable from the video output of the video source (for example, a VCR or video camera) to the analog video input of the converter box. A video camera should be in playback or VTR mode. Connect the audio source, too.
3. The converter box will typically have a switch or button that tells the device which direction to convert the video, analog to DV or DV to analog. For capturing analog video, you will want to press the button labeled "Analog In" or something similar.
4. Connect a 4-to-6 pin FireWire cable from the DV out port on the converter box (sometimes labeled FireWire, IEEE 1394, or iLink with Sony devices) to a FireWire port on the computer.
5. Open the iMovie application program.
6. Make sure the Mode Switch under the iMovie monitor is set to Camera Mode, as shown here.

7. Some converter boxes have a green status light, to indicate a good connection. If this light is amber or red at this point, try turning the device off for several seconds and then back on again. You may also try quitting and opening iMovie again.
8. Press play on the VCR or analog camera. You should see the video signal in the iMovie monitor. If you have speakers or headphones connected to the VCR you can monitor the audio.
9. Use the controls on the video source to manually cue the video tape to the desired spot, and click Import in iMovie. iMovie will create a new clip for about every nine minutes of video. You can join all the clips later by dragging them into the timeline.

Sending Video From iMovie to the Converter Box

Follow these steps to export video to an analog-to-FireWire converter box. While this specific order may not be necessary with all converters, it will help ensure proper initialization between the hardware and software:

1. Start up your computer, turn on the converter box, and connect the computer to the converter with a FireWire cable.
2. Connect the video cable from the video output of the source (for example, a VCR or video camera) to the analog video input of the converter box. A video camera should be in playback or VTR mode. Connect the audio source, too.
3. The converter box will typically have a switch or button which tells the device which direction to convert the video, analog to DV or DV to analog. For exporting analog video, you will want to press the button labeled "Analog In" or something similar.
4. Connect a 4-to-6 pin FireWire cable from the DV out port on the converter box (sometimes labeled FireWire, IEEE 1394, or iLink with Sony devices) to a FireWire port on the computer.
5. Open the iMovie application program.
6. From the **iMovie** menu, choose **Preferences** (or **File** menu in Mac OS 9).
7. Click the Advanced tab.
8. Make sure the checkbox for "Video Play Through to Camera" is selected.
9. Choose Export Movie from the File menu, or press Command-E on the keyboard.

10. In the Export Movie window, select the pop-up menu for "Export to Camera", even if you're exporting to a VCR through the converter.
11. Press record on the VCR and click Export in iMovie.
12. When finished, press the stop button on the VCR and Stop in the iMovie monitor.

iSync 1.x: Both First and Last Name of a Contact From a Mobile Phone Appear in Last Name Field

Setting the contact view to "Last name, First name" on some mobile phones may cause the contact name to be incorrectly imported into Address Book.
This article has been archived and is no longer updated by Apple.

Symptom

A contact's last name and first name both appear in the Last name field in Address Book.

Solution

On some phones, you can set contacts to be displayed by either last name first or first name first. If the phone is set to display contacts with the last name first, the contact name will be reported to iSync incorrectly, and it will sync erroneous data into Address Book. Consult the documentation that came with your mobile phone, or contact the phone's manufacturer for more information about how to set the sync view to First name Last name.

iSync: Contact with a phone number in Address Book isn‘t synced to your mobile phone

This article has been archived and is no longer updated by Apple.

When using the "Only synchronize contacts with phone numbers" feature of iSync, a contact may not be transferred to a phone if there is no Home or Work phone number attached.

For example, a contact with only a pager phone number might not appear in your mobile phone's contacts list after you sync.

Solution

Either do not use the "Only synchronize contacts with phone numbers" option, or paste the number into a different field, such as home or work.

Note: You can set iSync to not sync contacts to your phone if they don't have telephone numbers in Address Book.

iSync: Some recurring events do not sync correctly to a Palm OS device

This article has been archived and is no longer updated by Apple.

Recurring events scheduled on the last day of the month may not sync correctly to a Palm OS-based device.

For example, a recurring event scheduled on the last day of the month (30th, or 31st) in iCal, does not sync to a Palm OS-based device correctly. For example, if a recurring event is scheduled on 08-31, it will appear on 09-30 when the expected behavior would be to skip all months that have less than 31 days.

This issue only affects Palm OS-based devices. The same information synced to other devices, such as a mobile phone with a calendar, behave as expected.

Sync fast or slow with iSync and HotSync Manager

In the iSync conduit settings, accessed through Palm's HotSync Manager application, there is an option for "Force slow sync". What's a slow sync for?

This article has been archived and is no longer updated by Apple.

Slow sync

All records on a device are examined for modifications, additions, and deletions. The records are compared to a cached checksum to figure out if the record is different. This takes more time than a fast sync.

Fast sync

A device gives iSync a list of additions, modifications, and deletions. Because records on the device aren't looked at individually, the sync is faster.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please **contact the vendor** for additional information.

Some calendar events and contacts are duplicated on your iPod

iSync copies all of your Address Book and iCal information to iPod. Any calendar or contact information you copied to iPod yourself isn't affected by iSync, which may create some duplicate entries.
This article has been archived and is no longer updated by Apple.

Duplicate contacts or calendars appear on iPod

1. Make sure iPod is set up to be used as a hard disk you can store files on.
2. Connect iPod to your computer.
3. Double-click the iPod disk icon in the Finder.
4. Open the Contacts folder.
5. Drag vCard files for contacts that are already in Address Book from the Contacts folder to the Trash. Do not remove "iSync.vcf".

Tip: To synchronize your iPod with data from more than one computer, use the .Mac feature of iSync to sync the two computers first.

Syncing data already on iPod

If you have contact or calendar information on iPod that isn't in Address Book or iCal, you can import this data and sync it all with iSync.

1. Import contact and calendar files from iPod into Address Book and iCal.
2. Drag the files you imported from iPod to the Trash.
3. Sync iPod to Address Book and iCal using iSync.

iSync‘s log helps when troubleshooting issues

iSync's log contains useful, easily-understood messages that can help isolate issues.

This article has been archived and is no longer updated by Apple.

When iSync is used to synchronize data among devices, it generates a log containing information about what data and devices were synchronized. This information can be helpful in isolating and resolving issues in iSync.

You can see this log by choosing Show Logs from the Window menu, or by pressing the Command-L keyboard shortcut.

Information contained within the log is organized and easy to read. Error messages are in colored text so they can be easily noted.

iSync: Address fields with the same name are not synced

This article has been archived and is no longer updated by Apple.

In Address Book, it is possible to create multiple address fields or phones numbers with the same name (label) in a contact. For example, two "home" addresses or two "work" phone numbers. When you sync with iSync (any version), only the first of the same-named fields is synced. Other fields with the same name are ignored.

Make sure the address you want synced to your devices is listed first.

Published Date: Oct 7, 2016

iSync: Due Dates for To Do Lists on Mobile Phone Do Not Sync Correctly

Due dates for To Do items may not sync correctly on some mobile phones.
This article has been archived and is no longer updated by Apple.

Symptom

When you change a To Do item's due date on your mobile phone, this change is not synced to iCal.

Solution

Some mobile phones do not indicate that the due date has been changed, so iSync cannot change the due date in iCal.

Contact the phone manufacturer for information regarding resolution of this issue.
Published Date: Oct 7, 2016

iSync: Certain mobile phone modes may cause an improper or incomplete sync

This article has been archived and is no longer updated by Apple.

If your mobile phone is in a certain mode (state) your sync may be incomplete or may fail.

When you sync a mobile phone that is in a state or mode that prevents data from being copied, the sync may be incomplete, or may fail. For example, if you are editing a contact on the phone when a sync is initiated, the information in that contact may not sync properly.

For best results, make sure the phone or other device is in its normal standby mode before trying to sync.

Published Date: Oct 7, 2016

iSync: Same picture used on two Macs may cause conflict

This article has been archived and is no longer updated by Apple.

When you use the same picture for a contact in Address Book on two different computers, a conflict may occur when the Address Books are synched.

Solution

Add an image to the contact on both computers (even if it's the same image). When the sync conflict occurs, pick one of the two images to resolve the conflict. Note: It is possible for this issue to reappear.

Additional information

When a picture is added to a contact in Address Book, the image is stored as a TIFF file. When the image is saved, information from the computer's Display Profile is used to compress the image. Because each computer's profile can be different, this creates an image file with slightly different information. In this situation, when you perform a sync using iSync, the two images are interpreted as different, and a conflict occurs.

Published Date: Oct 7, 2016

iSync: About To Do list priority differences between iCal and Palm

This article has been archived and is no longer updated by Apple.

Read about differences between To Do list priorities in iCal and Palm OS in this informative document.

iCal and Palm OS have different priority quantities. When synching data between iCal and a Palm, the priorities will be somewhat different, but they will still reflect a relative order.

Palm devices also have no method for specifying a "no priority" condition. When a "no priority" iCal task is synced, it will assume the lowest priority on a Palm.

Relative priorities of iCal and Palm devices

Palm	iCal
1	1
2	2
3	3
4	3
5	none

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Published Date: Oct 7, 2016

iSync: Recurring events appear in iCal‘s unfiled calendar

This article has been archived and is no longer updated by Apple.

If you change a recurring event on a Palm, it may be moved to the Unfiled calendar in iCal when you sync the Palm with iSync.

Symptom

When a recurring event is modified on a Palm OS-based device and then synced with iSync, the event is moved to iCal's Unfiled calendar. This potentially creates a duplicate in the Unfiled calendar of an event that is already in another calendar ("Home", for example).

Solution

If the event was originally in the Unfiled calendar in iCal, it will not be moved to another calendar type.

Published Date: Oct 7, 2016

iSync: About recurring events on earlier mobile phones

This article has been archived and is no longer updated by Apple.

Recurring events are handled differently when synced with a earlier ("older") mobile phone.

Some phones allow you to create a recurring event in the calendar application on the phone. On some earlier phones, iSync may not treat these events as recurring, but instead will create individual, detached events for each occurrence in iCal when syncing.

iSync 1.0: Contact Information Appears Truncated in Address Book

If a truncated field is modified on a mobile phone and then synced with Address Book, the modified, truncated field will overwrite the field in Address Book.
This article has been archived and is no longer updated by Apple.

Symptom

When you sync a contact that you updated on your mobile phone to your computer using iSync, information in some of the fields is truncated in Address Book.

Solution

For best results, only edit contact information in Address Book.

Additional information

Because of the limited memory and display space on most phones, some contact information and event data may be truncated when synchronized using iSync.

If a truncated field is modified on the phone and then synched using iSync, the modified information on the phone will overwrite the information in Address Book, resulting in truncated information in Address Book.

This is correct behavior because when determining which information is to be kept, the most recently modified version is the one that is kept. However, due to limitations of the phone noted above, this may result in some undesired results in Address Book, or other applications where field length is not an issue.

Only fields that have been modified on the phone will be synced. If you have an Address Book contact where the first and last name were truncated on a sync to the phone, and the last name is edited on the phone and you sync again, only the last name field will be sent back in a truncated form to Address Book. The first name will not be changed.
Published Date: Oct 7, 2016

iSync conduit is activated from Palm HotSync Manager

In order to sync with a Palm OS device, configure conduit settings in HotSync Manager. Otherwise your contacts might not be synchronized.
This article has been archived and is no longer updated by Apple.
Make sure you have configured the iSync conduit from HotSync Manager:

1. Open the HotSync Manager application (usually located in /Applications/Palm/).
2. From the **HotSync** menu, choose **Conduit Settings**.
3. Select the iSync Conduit from the list of available conduits.
4. Click Conduit Settings.
5. Select "Enable iSync for this Palm device".
6. Click OK.
7. Quit the HotSync Manager application.
8. Open the iSync application.

You should now see a Palm icon in the iSync device list. Select the Palm icon in the iSync application to configure the information you wish to synchronize with this device.

Tip: To synchronize a Palm device via USB and iSync,initiate the sync by pressing the HotSync button on the Palm cradle. See iSync Help for additional information.

Macintosh: How to Connect to the Internet Using a GPRS Mobile Telephone

This document explains how to connect to the Internet using a GPRS mobile telephone as a wireless modem.

This article has been archived and is no longer updated by Apple.

You can connect your Macintosh to the Internet using a GPRS (General Packet Radio Service) mobile telephone as a modem. To do so, you should first make sure that you can:

- Connect to the Internet over GPRS using the WAP browser in your telephone
- Connect your Macintosh to your mobile phone over IrDA or Bluetooth.

Once you can do these two things, you can set up your computer to use the telephone as a wireless modem to connect to the Internet.

Important: GPRS data services and Internet access are typically optional offerings. Ask your mobile phone operator about GPRS availability in your area, and what the subscription fees and service charges are.

Connecting to the Internet over GPRS using the WAP browser in your telephone

Most recent mobile phones allow wireless Internet access right on the phone. This service uses the Wireless Application Protocol (WAP) and a "microbrowser" in the telephone to allow you to browse the Internet. Before you try to connect your Mac to the Internet using your telephone as a wireless modem, you should first make sure that you can connect to the Internet using the WAP microbrowser over GPRS. Not all telephones that use WAP have a GPRS data feature, and not all mobile telephone operators offer a GPRS service--even if your telephone is capable of using it.

1. Make sure your mobile phone is capable of using your operator's GPRS data service. Some phones may only be able to use WAP over circuit-switched data (CSD) connections. In this case you won't be able to use your phone as a wireless modem.
2. Subscribe to the GPRS data service.
3. Configure your telephone with the necessary network settings to use your operator's GPRS data service. The GPRS settings used by your mobile phone operator may already be saved on the phone's SIM card. If this is the case, you need only select this setting or profile. If not, your operator should have given you these settings, and explained how to enter them into your telephone. Typically, these settings include:
    - GPRS dial-up number
    - APN (Access Point Name)
    - User ID
    - Password
    - IP Address
    - DNS Address
    - other advanced settings such as authentication, data compression, header compression, and quality of service

See the related documents for further instructions.

QuickTime: About the QuickTime 6.0.2 Update

The QuickTime 6.0.2 Update addresses certain issues, and updates QuickTime software.

This article has been archived and is no longer updated by Apple.

This software updates QuickTime 6.0, or 6.0.1 to QuickTime 6.0.2.

Installation

There are two ways to update from QuickTime 6.0, or 6.0.1 to QuickTime 6.0.2.

Automated Software Update Installation

Mac OS X

1. Choose System Preferences from the Apple menu.
2. Choose QuickTime from the View menu.
3. Click the Update tab.
4. Click Update Now.

Note: QuickTime 6.0.2 is also available as an update in the Software Update pane of System Preferences.

Mac OS 9 and Windows

1. Open the QuickTime folder.
2. Open the QuickTime Updater application program. It automatically checks the server, then downloads, and installs the update.

Alternatively, open the QuickTime Player application, and choose "Check for QuickTime Updates" from the Help menu. Make sure you have an active Internet connection before you check for updates.

Note: QuickTime 6.0.2 for Windows is only available in English, French, German, and Japanese.

Standalone Installer

A standalone installer is available from the QuickTime website (http://www.apple.com/quicktime/).

Enhancements included with this update

- Enhances the security of QuickTime software updates and downloads
- Improves the stability and performance of exporting audio
- Enhances the performance of MPEG-4 playback
- Improves MPEG-4 recording and streaming
- Improves QuickTime Java usability
- Improves AAC audio export feature

Using QuickTime 6 with other applications

Final Cut Pro 3.0.2 has been qualified for use with QuickTime 6 included with Mac OS X 10.2. If you are using an earlier version of Mac OS X, you should continue using QuickTime 5.

Published Date: Feb 19, 2012

QuickTime: About the QuickTime 6.1.1 Update

The QuickTime 6.1.1 Update addresses certain issues, and updates QuickTime software.

This article has been archived and is no longer updated by Apple.

This software updates QuickTime 6.0, 6.0.1, 6.0.2, or 6.1 to QuickTime 6.1.1.

System Requirements

To use QuickTime 6.1.1, your computer should meet these system requirements.

- PowerPC G3, or PowerPC G4 microprocessor
- Mac OS X 10.1.5 or later
- A minimum of 128 MB of memory (RAM)

Automated Software Update Installation

1. Choose Apple menu > System Preferences.
2. Choose View > QuickTime.
3. Click the Update tab.
4. Click Update Now.

Note: QuickTime 6.1 is also available as an update in the Software Update pane of System Preferences.

Standalone Installer

A standalone installer is available from the QuickTime website (http://www.apple.com/quicktime/).

About QuickTime 6.1.1

QuickTime is Apple's award-winning, industry-leading software architecture for creating, playing, and streaming digital media for Mac OS and Windows. With the introduction of QuickTime 6.1.1, Apple builds on its tradition of leading the industry in the adoption of revolutionary worldwide standards.

- MPEG-4 ISO compliant file creation
- MPEG-4 video codec
- AAC audio codec
- Instant-On streaming
- Macromedia Flash 5
- Enhanced QuickTime Player interface
- QuickTime Picks, bringing you the best, up-to-date content

Included in QuickTime 6.1.1

A true all-in-one, standards-based, cross-platform media tool, QuickTime 6.1.1 delivers a host of features that includes the following:

- JPEG 2000 (Mac OS X Only)
- Enhanced AppleScript integration (Macintosh Only)
- Improvements to iMovie and iDVD audio/video synchronization.
- Significant performance improvements in DV.
- Full screen enhancements for QuickTime Pro users.
- Important improvements to MPEG-4 streaming.

For more information, see the QuickTime website at (http://www.apple.com/quicktime/). The QuickTime website also provides many links to cool QuickTime content and to other Internet sites that showcase QuickTime.

Published Date: Feb 19, 2012

QuickTime 6: About the 3GPP Component

This software allows you to import and play 3GPP content with QuickTime 6.3 and later.
This article has been archived and is no longer updated by Apple.

About QuickTime's 3GPP component

QuickTime is Apple's award-winning, industry-leading software architecture for creating, playing, and streaming digital media for Mac OS and Windows. QuickTime 3GPP Component adds the ability to import and play back files in the 3GPP format, the worldwide standard for the creation, delivery, and playback of rich multimedia over high-speed wireless networks. In addition, this component enables QuickTime Pro users to author 3GPP files including video, audio, and text. This release of QuickTime 3GPP Component requires QuickTime 6.3 or later.

For details on this feature and to download the software, visit the QuickTime website. The QuickTime website also provides many links to cool QuickTime content and to other Internet sites that showcase QuickTime.

iCal: "This invitation is not correct" Alert

In order to use the invitation features of iCal, you must specify your card in the Address Book application.

This article has been archived and is no longer updated by Apple.

Symptom

When you double-clicking an iCal invitation in the Mail application, an alert box with this message appears:

> "This invitation is not correct. Your email address does not appear among the attendees of this event."

When you try to invite a contact to an event, an alert box with this message appears:

> "Before you can invite anyone to an iCal event, you need to add their name and email address to your Mac OS X Address Book and create an address card for yourself."

Solution

One of the email addresses in an iCal invitation must correspond to one of your email addresses as noted in the Address Book application. iCal also requires that you specify your email address in the Address Book application before sending an invitation.

You can specify your card and email addresses in the Address Book application as follows:

1. Open the Address Book application.
2. Create a new contact if you are not already listed.
3. Select your name in the Address Book listing.
4. Make sure that each email address (account) you receive mail from in the Mail application is also listed in your contact information. If one or more addresses are not listed, click Edit, then click the Add (+) button next to the Email field to add additional email addresses you use.
5. Choose This Is My Card from the Card menu in Address Book.

The icon next to your name in the Address Book listing should change from a card icon to a user icon to indicate that this is your card. You should now be able to send and receive invitations.

Final Cut Pro 3 for Mac OS X: About Using Text Editors for Text Assets

This document describes issues you should be aware of when importing text assets, such as batch lists and EDLs, into Final Cut Pro 3 for Mac OS X.

This article has been archived and is no longer updated by Apple.

Final Cut Pro 3 expects text files to be in plain text format with Mac line endings. Because of this, you should not use TextEdit, the default text editor in Mac OS X, to edit or create text assets for Final Cut Pro 3. While TextEdit can be configured to save plain text files instead of RTF, TextEdit uses UNIX line endings, which are not properly recognized by Final Cut Pro 3.

As a solution, you should use a text editor that can be configured to use Mac line endings. For example:

- AppleWorks (Save As->Text)
- BBEdit (Preferences->Text Files: Saving->Default Line Breaks:Macintosh)
- Microsoft Word (Save As->Text Only)
- SimpleText in Classic mode (default saves OK)

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

Final Cut Pro 3: 29.97 fps Source Material Captured at 24 fps and 23.98 fps Timecode Issue

After capture of NTSC material that has been reverse telecined on capture with third-party cards to 24 or 23.98 fps, timecode will no longer reflect the original source tapes.

This article has been archived and is no longer updated by Apple.

Symptom

Immediately after capturing 29.97 fps source at 24 fps or 23.98 fps, Media Start and Media End timecode will still reflect correct timecode values. However, once the project is closed and re-opened, the timecode is no longer accurate.

Solution

This document will be updated as more information becomes available.

PowerBook G4 (1 GHz/867 MHz): Starts Up to Blinking Folder Icon After Restoring Hard Disk

The computer may start up to a blinking folder icon if Mac OS 9 is selected in the Startup Disk preferences and the computer's hard disk has been erased and restored.
This article has been archived and is no longer updated by Apple.

Symptom

The computer starts up to a blinking folder icon.

Solution

1. Restart the computer from the Restore DVD disc.
2. Open Disk Utility and turn on the option to install the Mac OS 9 drivers.
3. Erase the hard disk.
4. Reinstall Mac OS X and the additional software components.

Warning: Be sure to back up any files you wish to keep from the destination volume before erasing it.

Related documents

75275 "**Mac OS X: About the 'Install Mac OS 9 Drivers' Option in Disk Utility**"

Additional information

All PowerBook computers come with DVD Install/Restore software. They will not be able to start up using Mac OS 9 if you use this disc to erase the computer's hard disk and then restore the software. This is because the Mac OS 9 disk driver is disabled by default. The standard settings will not install the Mac OS 9 drivers.

.Mac Backup: CD/DVD Disc Spanning Restore Fails When Named in Japanese

You may not be able to restore from a backup if the CD/DVD is named in Japanese.

This article has been archived and is no longer updated by Apple.

Symptom

Backup fails to restore from a CD/DVD spanned backup if the backup was named in Japanese. An alert with this message appears:

> "Error copying the file 'File Name.'"

Solution

- Upgrade to Mac OS X 10.2.3.
  Upgrading resolves this issue.

Until you upgrade, if this issues occurs if you open Backup before inserting the master disc. Follow these steps:

1. Insert the master (last) disc in the CD/DVD drive. The disc appears on the desktop, or in the Finder window.
2. Open Backup.
3. Choose "Restore from CD/DVD" from the View menu.
4. Select the items you want to restore.
5. Click Restore Now.

AppleCare Protection Plan CD 0Z691-4021: Slow to Start Computer

The AppleCare Protection Plan CD that can start up in both Mac OS 9 and Mac OS X may be slow to start the computer.

This article has been archived and is no longer updated by Apple.

Symptom

Starting up from the CD takes a long time.

Solution

It is normal for the multi-lingual AppleCare Protection Plan CD to take up to 2 minutes to start up to the language selection dialog on some computers and configurations.

Lexar Media Memory Stick USB Reader
Memorex USB Dual Card Reader
SmartDisk Reader for Memory Stick
SmartDisk MemoryStick Reader
SmartDisk CompactFlash Reader
Sony MSAC-US1 (Memory Stick)

Developers who wish to have products added to this list should download the **Image Capture SDK** and send a copy of each successful CameraCheck report to **ica@group.apple.com**.

All cameras are USB 1.x unless otherwise noted. Additional cameras may be supported. Non-USB digital still cameras that use CompactFlash, Memory Stick, MultiMedia Card (MMC), SecureDigital (SD) and SmartMedia cards are supported when the memory card is used with a supported media reader. While most media readers are MSC-compliant and will "just work", some media readers may require additional drivers to be installed in order to work with Mac OS X. Native ("RAW") picture formats may require additional software.

Notes:

(1) FireWire (IEEE 1394a) interface.

(2) USB 2.0, will work at 1.x speed when connected via a USB 1.x port.

(3) Requires Mac OS X v10.2.2 to work in default mode. Will work with any version of Mac OS X when set to PTP mode.

AppleWorks 6 for Windows: Unexpectedly Quits When You Resize a Graphic

This article has been archived and is no longer updated by Apple.

After updating to QuickTime 6, AppleWorks 6 for Windows may unexpectedly quit when you resize a graphic.

Symptom

When you resize a graphic in an AppleWorks document, the application unexpectedly quits.

Solution

Update to AppleWorks 6.2.2 or later. The update can be found in "**AppleWorks 6.2.2 for Windows: Information and Download**"
Published Date: Feb 20, 2012

iPhoto: Do Not Include the ? Character in a Photo‘s Filename When Ordering Prints

Apple is unable to make prints of photos that have a question mark (?) in their filename.
This article has been archived and is no longer updated by Apple.
One or more of the photos you ordered is missing. When you look at the photo in the library, it has a ? character in its filename.

This happens when using:

- iPhoto 1.1 and later

Before you order prints, make sure none of the photos in your order have a ? character in their filenames. If any photo's name contains a ? character, rename it without using a ?. Follow these steps:

1. Select Photo Library.
2. Select the photo(s).
3. Choose Export from the File menu.
4. Click Export. **Note:** Take note as to where the photo(s) will be exported.
5. Rename the file without the ? character.
6. Choose Import from the File menu.
7. Select the photo(s).
8. Click Import.

Note: You will now have duplicate photos in the iPhoto Library. You might want to delete the photo with the ? character in the filename to prevent confusion when ordering prints.

Additional information

If a print order has a photo with a filename containing a ? character, the order will be set aside, and examined by Apple.

If the number of affected photos is less than 10 percent of the total order, the affected photos will be removed from the order. The billing statement will be updated to reflect that these photos were removal, and an email will be sent to you explaining the situation.

If the number of affected photos makes up more than 10 percent of the order, the whole order will be canceled, and an email will be sent to you explaining the situation.

You will not be billed for prints Apple can't process.

QuickTime for Windows: How to Remove QuickTime From the System Tray

This document explains how to remove QuickTime from the Windows system tray.

This article has been archived and is no longer updated by Apple.

Follow these steps to remove QuickTime from the system tray:

1. Right-click the QuickTime icon in the system tray. A contextual menu appears. See Figure 1.
2. Choose QuickTime Preferences. The QuickTime Settings window appears. See Figure 2.
3. Click the checkbox to deselect "QuickTime system tray icon".

iDVD 2: Burning a DVD-R Using a PowerBook G4 With Built-In SuperDrive

On a PowerBook G4 (1 GHz/867 MHz) with built-in SuperDrive, iDVD 2 will not ask you to insert a blank DVD-R if you click the Burn button only once. Click the burn button a second time before inserting a blank DVD-R disc.
This article has been archived and is no longer updated by Apple.

Symptom

When you click Burn in iDVD and insert a blank DVD-R disc, the disc is opened by the Finder instead of iDVD.

Solution

Click the Burn button twice. iDVD will then ask you to insert a blank DVD-R disc.

iSync: How to Avoid Data Loss

This document lists steps you can take to avoid losing information when you sync devices with iSync.
This article has been archived and is no longer updated by Apple.
Important: You should always make a backup of your information before syncing devices with iSync. See Related Documents below for information on backing up.

Use these tips to avoid losing information when syncing with iSync.

- Make sure your computer's date and time are set correctly. Use the Date & Time pane in System Preferences to set the correct time.
- Make sure the devices you want to sync have their date and time set correctly.
- Check the battery or other power sources of your devices, and make sure there is enough charge to successfully sync with your computer.
- Only sync your devices with one computer. Syncing your devices with multiple computers could cause data to be lost. (You can sync data between two computers using .Mac).

Keynote 1.0: Locations of Associated Files

This document describes the locations of files associated with Keynote 1.0.
This article has been archived and is no longer updated by Apple.
Keynote must be installed on your startup volume (the partition of your hard disk that contains a System folder for Mac OS X version 10.2 or later). During installation, files related to the Keynote application are placed on your hard disk in the following locations:

Sample documents are placed in the folder /Library/Application Support/Keynote/Samples.

The Image Library is placed in the folder /Library/Application Support/Keynote/Image Library.

Any custom themes you create using Keynote must also be saved in one of the following locations, if you want them to be available in the Keynote theme selection dialog: /Library/Application Support/Keynote/Themes or ~/Library/Application Support/Keynote/Themes.
Published Date: Oct 7, 2016

Keynote: System Requirements

This document outlines updated system requirements for Keynote.
This article has been archived and is no longer updated by Apple.
Important: The system requirements included in the documentation and inbox materials of early shipments of Keynote 1.0 are incorrect.

To use Keynote, you need:

- Power Mac G3* or G4, PowerBook G4, eMac, 500 MHz or faster iMac or iBook (PowerPC G4 recommended)
- Mac OS X 10.2 or later
- 128 MB of RAM (512 MB recommended)
- 8 MB of video memory (32 MB recommended)
- 1 GB of available disk space

* Power Mac G3 and PowerBook computers with ATI Rage II, Rage IIc, or Rage Pro video graphics processors are not supported.

Keynote must be installed on your startup volume (the partition of your hard disk that contains a System folder for Mac OS X 10.2 or later).

Note: If you're using Mac OS X 10.2.3, see technical document 61858, "**Keynote 1.0: Stops Responding During Slide Show**".

Keynote 1.0: Transitions Appear "Choppy" When Viewed on a Projector

Builds and slide transitions may not appear to execute smoothly when viewed on a VGA Projector set to a low refresh rate.
This article has been archived and is no longer updated by Apple.

Symptom

Builds and slide transitions (such as the Move In transition) appear to stutter when viewed on a VGA Projector.

Solution

Builds and transitions, especially the Move In transition, can look choppy on low-end VGA projectors. To alleviate this problem, try selecting a different refresh rate, which you can set in the Displays pane of System Preferences. You can also try to fine-tune the input signal on the projector. Generally, the best results are achieved by matching the refresh rate of the projector to that of the primary monitor (60 Hz for LCD displays). This problem is not an issue with projectors that use a DVI connection.

To open the Displays pane of System Preferences:

1. Choose Apple menu > System Preferences
2. Choose View > Displays.

Keynote 1.0: Translucent Elements Look Fuzzy When Viewed in PowerPoint

Microsoft PowerPoint may not display all translucent graphic elements of a Keynote presentation properly.
This article has been archived and is no longer updated by Apple.

Symptom

Keynote presentations which include graphic elements that use image transparency may look fuzzy when viewed in Microsoft PowerPoint for OS X.

Solution

This is a limitation of Microsoft PowerPoint. Consider viewing Keynote presentations using the Keynote application, or export the presentation to QuickTime to be viewed in QuickTime player.

Keynote 1.0: "Computer does not have enough video random-access memory" Alert

If you connect a second display to the computer while the Keynote application program is open, an alert with a message about the computer not having enough video random-access memory (VRAM) may appear.
This article has been archived and is no longer updated by Apple.

Symptom

When you play a slideshow and then connect a second display to the computer while the Keynote application is open, an alert with this message appears:

> "Your computer does not have enough video random-access memory (VRAM) to play the slideshow at the current screen resolution"

Solution

Quit the Keynote application before connecting a second display,

or

Download and install Mac OS X 10.2.4 or later. It is available from the Software Update pane of System Preferences, or from the Apple Software Downloads website (http://www.apple.com/swupdates/).

Keynote 1.0: How to Import a File

This document explains how to import different types of files.
This article has been archived and is no longer updated by Apple.
You can place many different types of file on the slide canvas. You can drag graphics, movies, and sound files directly from the Finder to the slide canvas, or you can use the Place command to find the file.

To place a file:

1. Choose Edit > Place > Choose and select the file you want.
2. Click Place.

Compatible file types include all QuickTime and graphics formats (for example, MP3, Flash, QuickTime, PDF, TIFF, JPEG, and GIF).

Keynote 1.0: How to Import Photoshop Files

This document explains how to import Adobe Photoshop files into Keynote 1.0.
This article has been archived and is no longer updated by Apple.
To import a file from Photoshop, first export it as a TIFF file.

Follow these steps in Photoshop:

1. Choose File > Save As.
2. Choose TIFF from the Format pop-up menu.
3. If you want to preserve layers, leave the Layers checkbox selected. Otherwise, click the checkbox to deselect this option.
4. Click Save
5. In the TIFF options panel, select appropriate compression and byte order (Macintosh).
6. Click the checkbox to select the "Save Transparency" option.
7. Select the appropriate Layer Compression.
8. Click OK.

Follow these steps in Keynote:

1. Choose Edit > Place > Choose.
2. Select the TIFF file, and click Place.

Published Date: Oct 7, 2016

Keynote 1.0: How to Import Illustrator Files

This document explains how to import Adobe Illustrator files into Keynote 1.0.
This article has been archived and is no longer updated by Apple.
To import Illustrator files into Keynote, first save them as PDF files.

Follow these steps in Adobe Illustrator:

1. Choose File > Save As.
2. Choose Adobe PDF from the Format pop-up menu.
3. Click the checkbox to select the "Append File Extension" option.
4. Click Save.

Follow these steps in Keynote:

1. Choose Edit > Place > Choose.
2. Select the PDF file, and click Place.

Opening an iMovie project in Final Cut Express HD

This article has been archived and is no longer updated by Apple.

You can open and edit movies created in iMovie with Final Cut Express HD.

Note: Project files created in iMovie 2 or earlier cannot be opened in Final Cut Express HD. To open an iMovie project, follow these steps:

1. Open Final Cut Express HD.
2. From the **File** menu, choose **Open**.
3. In the dialog that appears, select the iMovie project you want to open. The iMovie project opens in the Browser and contains the sequence and clips as they appeared in the iMovie clips shelf.
   Important: Final Cut Express HD does not import iMovie sound effects, audio levels, or transitions. All other applied effects are imported.
4. Double-click the sequence to open the iMovie project in the Timeline.
5. Render the sequence if necessary.

Imported clips are linked to the original clips captured and/or rendered in iMovie. These original clips can be found inside the iMovie project bundle for iMovie HD or in the iMovie project's Media folder for versions 3 and 4.

Notes

- DV Stream files do not have timecode tracks, so DV media imported from iMovie project files cannot be recaptured.
- Imported iMovie DV files might not play back or print to tape in real time without being rendered first.
- All imported source media must be backed up for future reediting.

iSync 1.x: Admin user can sync, but other users cannot

This article has been archived and is no longer updated by Apple.

If you have limited users' capabilities on a computer, only users with administrator accounts can sync using iSync.

Symptom

Only users with administrator accounts can sync using iSync 1.5 or earlier. Other users can open the application, but it does not sync.

Solution

1. Log in as a user with an administrator account.
2. Choose Apple menu > System Preferences.
3. Choose View > Accounts.
4. Select the affected user name and click Capabilities.
5. Drag the file /System/Library/CoreServices/SyncServer into the list of allowed applications, or click the checkbox to deselect the "Use only these applications" option.

If you choose to keep a list of allowed applications, you should also drag these files into that list if the users may use mobile phones:

- /System/Library/CoreServices/BluetoothUIServer
- /System/Library/CoreServices/OBEXAgent

Mac OS X 10.2.3: Software Update Erroneously Shows the iTunes 3.0.1 Update

If you have selected a preferred language other than English in the International pane of System Preferences in Mac OS X 10.2.3, Software Update erroneously shows the iTunes (3.0.1) update even though the installed version of iTunes is version 3.0.1.
This article has been archived and is no longer updated by Apple.

Symptom

The iTunes (3.0.1) update appears in Software Update even though the installed version of iTunes is version 3.0.1.

Solution

1. Make sure that the current installed version of iTunes is 3.0.1.
2. Select the iTunes 3.0.1 update in the Software Update window.
3. Choose Update > Make Inactive.

This will prevent the iTunes 3.0.1 update from appearing in the list of available software updates. You can make the hidden iTunes 3.0.1 update available again by choosing Update > Show Inactive Updates.

iSync: How to use disabled Palm Conduits

This article has been archived and is no longer updated by Apple.
This document explains how to use disabled conduits again if you wish.

Installing the iSync Conduits for Palm automatically turns off conduits the installer thinks may conflict with the iSync conduit. This is because only one application can sync with a PalmOS database at at time. When you use the iSync Palm Conduits installer, it assumes that you want to use iSync to synchronize your Palm calendar, address book, and to-do list with iCal and Mac OS X Address Book.

If you decide to not use iSync, or if you feel that one of the disabled conduits will not conflict if configured properly, you can use these conduits again by dragging them from:

/Library/Application Support/Palm HotSync/Disabled Conduits

to:

/Library/Application Support/Palm HotSync/Conduits

Be sure to configure the conduit(s) in HotSync Manager.

Additional information

The following conduits which are included with Palm Desktop can safely be installed in the /Conduits folder without conflicting with the iSync conduit:

- Backup Conduit
- Install Conduit
- Memo Conduit
- Memos Conduit
- Voice Memo Conduit
- Photos Conduit
- Note Pad Conduit

Keynote 1.0: Unexpectedly Quits When Opened

Keynote 1.0 unexpectedly quits when opened if your computer doesn't have enough free disk space.
This article has been archived and is no longer updated by Apple.

Symptom

The application unexpectedly quits ("crashes") when you open it.

Solution

Make sure there is more than 138 MB of free disk space on the startup volume. You can make more space by dragging files you don't need anymore to the Trash and choosing Finder > Empty Trash. **Important:** Once you empty the Trash you cannot retrieve deleted files.

DVD Studio Pro 1.5.2: Dual Layer Break Point Message While Building a Single-Layer Project

When building a disc from a Single Layer project using DVD Studio Pro 1.5.2, under certain conditions you may see a message that says a valid Dual Layer Break point was not found, or a messaging reporting that a Dual Layer Break point was successfully set.
This article has been archived and is no longer updated by Apple.

Symptom

When building a disc from a Single Layer project using DVD Studio Pro 1.5.2, under certain conditions you see a message that says a valid Dual Layer Break point was not found, or a messaging reporting that a Dual Layer Break point was successfully set.

Solution

This situation generally can occur if you are building a single layer project with a disc size in the range of 3.9 to 4.7 GB, containing one long video asset, and if there are very few or no markers set toward the end of the track.

This error does not occur with DVD Studio Pro 1.5.1 or earlier. You can see the messages in DVD Studio Pro's log. An example of the layer break error log might look like this:

4:25:51 PM This disc complies to version 1.0 of the DVD-Video Specification
4:25:51 PM Building finished
4:25:51 PM Start Formatting on "Pioneer DVD-RW DVR-104"
4:25:53 PM Unable to find a valid Dual Layer Break Point.
4:25:53 PM A new marker must be created after marker 1 in track 1.
4:25:53 PM The new marker must be located within the range of 51.3 to 96.5% in this track.
4:25:53 PM Formatting Failed! (Error #81)

To workaround this error, add a marker to the track that is reporting an error, and Build & Format the project again. The steps for adding a marker can be found on page 35 of the DVD Studio Pro manual.

1. In Graphical View, double-click the video thumbnail of the track listed in the log, to open the Marker editor.

Figure 1 Marker editor

2. Click the New Marker button.
3. Drag the slider to an area in the range described in the log (in this case, 51.3 to 96.5% from the start of the track)
4. Name the marker something like, "blank marker".
5. In the Property Inspector, under the General settings, set "Can Be Accessed" to No.

Figure 2 Property Inspector

6. Save your project. Choose File > Build & Format Disc to rebuild your project.

In the other scenario where you get a successful break point message in a single layer project, the log would look something like this:

4:25:51 PM This disc complies to version 1.0 of the DVD-Video Specification
4:25:51 PM Building finished
4:25:51 PM Start Formatting on "Pioneer DVD-RW DVR-104"
4:42:29 PM The dual layer breakpoint has been set at block number 2204592.
4:42:29 PM Formatting Finished.

The message/action is harmless and does not impact the burning or playability of the title.

Image Capture, iPhoto: Camera With Newly Formatted Memory Stick Not Recognized

When you connect a digital camera with a newly formatted Memory Stick to your computer, iPhoto or Image Capture may not automatically open.

This article has been archived and is no longer updated by Apple.

Symptom

If you format (erase) a Memory Stick with your digital camera and then connect to your computer, the media will appear on the desktop, but Image Capture or iPhoto do not recognize the media and do not automatically open.

Solution

Take a picture before connecting the camera to the computer.

When a memory stick is formatted in the camera it lacks the file structure needed for the Macintosh to recognize the media as camera storage media. Once you take a picture, the file structure is created, which indicates to the Macintosh that the Memory Stick is camera media. Image Capture and iPhoto will then recognize the card and open automatically when the camera is connected to the computer.

Keynote 1.0: "Not enough VRAM" Alert If Third-Party ATI Drivers Are Installed

When using Keynote 1.0 on Mac OS X 10.2.3, if you have installed a retail ATI video card, and then installed ATI driver software, an alert will appear when you try to play a slideshow.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to play a slideshow, an alert with the message "Not enough VRAM" appears.

Solution

Mac OS X 10.2.3 and later include driver software that works with these cards. If you install the ATI drivers, you may need to do an Archive & Install of Mac OS X, preserving user settings, to return to a configuration that works with Keynote 1.0. For more information see technical document 107120, "**Mac OS X 10.2: About the Archive and Install Feature**".

iMovie: About "Found files that don‘t belong in project folder. Okay to move them to Trash?" Alert

This document discusses the alert message that may appear when an iMovie project is opened: "Found <number> files that don't belong in project folder. Okay to move them to Trash?"
This article has been archived and is no longer updated by Apple.
This message appears when extraneous files are in the project's Media folder. These items may typically be in the Media folder for one of two reasons: they were intentionally put there, or iMovie unexpectedly quit or was force-quit while rendering a file.

Click "Trash Unused Files" to move the files to the Trash. You should select this unless you know which files are in the Media folder and do not want them removed. You can examine which files these are by quitting iMovie and clicking the Trash icon on the Dock.

Click "Leave Files Alone" to leave the unused files in the Media folder. This message will continue to appear each time the affected iMovie project is opened.

iPod 2.0: How to Display Notes Created With Japanese, Korean, or Traditional or Simplified Chinese Characters

When you copy a TextEdit note to iPod that has Japanese, Korean, or traditional or simplified Chinese characters with UTF8 text encoding, the note might not appear on iPod's display.
This article has been archived and is no longer updated by Apple.

Symptom

When you copy a TextEdit note to iPod that has Japanese, Korean, or traditional or simplified Chinese characters with UTF8 text encoding, the note does not appear on iPod's display.

Solution

The iPod Note Reader (Extras > Notes on iPod) can display any plain text file. To display a file with characters from these languages, make sure you are using the right text encoding, or use an application that can save the note as Unicode text.

Additional information

By default all note files are considered to be encoded in Latin1, unless the iPod language preference is set to Japanese, Korean, or traditional or simplified Chinese, in which case all note files are assumed to be in that encoding.

Note: You can tag a note file with a different encoding by including the following line: <?xml encoding="MacJapanese"?>

iPod handles these encodings: Latin1, MacRoman, MacJapanese, Korean, simplified Chinese, traditional Chinese, UTF8 Unicode and UTF16 Unicode.

iPod recognizes these encoding names:
For Latin1: iso-8859-1, Latin-1.
For MacRoman: x-Mac-Roman, Mac, Macintosh.
For MacJapanese: x-Mac-Japanese, Mac-Japanese, MacJapanese, Shift-JIS, Shift_JIS.
For traditional Chinese: x-Mac-Chinesetrad, Mac-Chinesetrad , BIG5, CN-BIG5.
For simplified Chinese: x-Mac-Chinesesimp, Mac-Chinesesimp, EUC-CN.
For Korean: x-Mac-Korean, Mac-Korean, EUC-KR.
For UTF8 Unicode: UTF8, UTF-8.
For UTF16 Unicode: UTF16, UTF-16, UCS2, Unicode.

Note: Each line lists multiple names for the same encoding, not separate encodings.

The only way to display multiple encodings in the same note is to use Unicode.

iPod 2.0 and 1.3: Software Version Comparison

This document describes the features and functions of iPod Software versions 2.0 and 1.3.

Note: iPod Software 2.0 and its features are only compatible with iPod (with Dock Connector) models. iPod Software 1.3 allows earlier iPod models to play MPEG4-AAC encoded files, including music purchased from the iTunes Store.
This article has been archived and is no longer updated by Apple.

iPod Software 2.0

iPod Software 2.0 includes these features and functions:

- Improved interface
  The menu system includes new and reorganized commands.
- On-The-Go Playlist
  You can create a temporary playlist directly on iPod.
- Improved Clock Menu
  All clock settings are accessible in one location for easy access.
- Alarm Clock
  You can set an alarm to go off at a specified time.
- To-Do Lists Viewing
  iCal to-do lists can be viewed on iPod.
- Notes
  iPod can store and view notes (text files).
- Games
  Includes three games.
- Customizable Main Menu
  You can decide which menu options appear in the main menu.
- Backlight Menu Command
  You can turn on and off the backlight from a menu command.
- Rating Songs
  You can rate songs on iPod.
- Updating Smart Playlists
  Smart Playlists update on iPod and sync back to iTunes.
- AAC File Playback
  iPod plays back AAC (.m4a and .m4p) files.
- Disconnect Message Removed
  The "OK to disconnect" message no longer appears.
- Improved iPod Software Updater
  You can update and restore without disconnecting and reconnecting iPod.
- NotesOnly (also known as "Museum Mode)
  Allows for complete customization of the entire menuing system. Example uses include using iPod in museums and kiosks. See the Apple Developer website (http://developer.apple.com/hardware/ipod/index.html) for more information.

iPod Software 1.3

iPod Software 1.3 includes these features and functions:

- Backlight Menu Choice
  A menu command has been added to turn on and off the backlight.
- AAC File Playback
  iPod plays back AAC (.m4a and .m4p) files.
- Battery Improvements

This document describes the iPod (with Dock Connector) model's touch-sensitive buttons.
This article has been archived and is no longer updated by Apple.
All buttons on the iPod (with Dock Connector) model are touch-sensitive. This includes the Select button, Previous/Rewind button, Menu button, Play/Pause button, and Next/Fast-Forward. These touch-sensitive buttons increase iPod's ruggedness and durability because there are fewer moving parts.

Building on the success of the touch wheel, touch-sensitive buttons are not affected by motion. Instead, they are activated when they contact another electrical conductor. Since the human finger is an electrical conductor, when it makes contact with the touch buttons and touch wheel, an electrical phenomenon called capacitance activates the command that has been entered.

When iPod's backlighting turns on, the four buttons above the touchwheel are illuminated orange-red. See Figure 1.

Figure 1 Illuminated buttons

The iPod (with Dock Connector) model's hold switch is not a touch-sensitive button. The buttons on the remote for the iPod (with Dock Connector) are mechanical buttons.

iPod (with Dock Connector): Reset to Wake From Sleep

You may need to reset the iPod (with Dock Connector) model to wake it from sleep.
This article has been archived and is no longer updated by Apple.

Symptom

iPod will not wake from sleep.

Solution

Reset iPod. See technical document 61705, "**iPod: How to Reset**" for steps to reset your iPod.

Note: When you reset iPod all your music and data files are saved. Some customized settings may be lost.

Published Date: Oct 10, 2016

iPod (with Dock Connector): About the Dock Connector and Cables

This document describes the iPod dock connector and the cables you can use with it.
This article has been archived and is no longer updated by Apple.
On the bottom of the iPod (with Dock Connector) is the dock connector.

A = Dock connector

Figure 1 The bottom of iPod

The dock connector port allows the iPod (with Dock Connector) to be connected to different devices.

There are two Apple-branded cables that use this connector. When disconnecting any of these cables, press in on the sides of the dock connector to release.

By using the iPod Dock Connector to FireWire Cable you can connect the iPod (with Dock Connector) to a computer with a FireWire port. Or, you can use the cable to connect this computer to the iPod Dock.

Figure 2 iPod Dock Connector to FireWire Cable

By using the iPod Dock Connector to FireWire and USB 2.0 Cable you can connect the iPod (with Dock Connector) or an iPod Dock to a computer with a USB 2.0 or USB 1.1 port and also connect iPod to power. Since USB does not supply power to iPod, it is important to plug the FireWire connector into the iPod AC Adapter.

Figure 3 iPod Dock Connector to FireWire and USB 2.0 Cable

Notes

1. The iPod (with Dock Connector) cannot use the 6-pin to 6-pin FireWire cable that came with previous iPod models.
2. Syncing with USB (certain versions of Windows-only) requires optional iPod Dock Connector to FireWire and USB 2.0 Cable and iPod Software Upate 2.0.1 or later. See technical document 60971, "**iPod: System Requirements**" for more information.
3. Connecting the USB and FireWire connectors into your computer simultaneously can cause the computer and/or the iPod to behave erratically or stop responding.

iPod for Windows: Do Not Synchronize When Battery Is Low

Charge iPod before synchronizing it with a Windows-compatible computer.

This article has been archived and is no longer updated by Apple.
Not all FireWire ports of Windows-compatible computer supply power to iPod when it is connected to the computer. For this reason, you should charge iPod by connecting it to the Apple iPod Power Adapter before synchronizing with your computer. iPod's battery is 80 percent charged in about an hour, and fully charged in about three hours.

To determine if your computer charges iPod when connected, see technical document 61676, "**iPod for Windows: Does Not Charge When Connected to Your Computer**".

For more information on how to charge the iPod see technical document 60939, "**iPod: About the Apple iPod Power Adapter**".

iPod: Skips to the Next Song

iPod sometimes skips to the next song if the file for the currently playing song is damaged.
This article has been archived and is no longer updated by Apple.

Symptom

iPod unexpectedly skips to the next song while playing a song.

Products affected

- iPod

Solution

1. Open iTunes and delete the song that skips from your music library.
2. Insert the audio CD for the song(s) that skip in your computer.
3. Use iTunes to Import the song from CD again.

iPod (with Dock Connector): About the Dock Connector Cover Plug

iPod (with Dock Connector) models come with a Dock Connector cover plug.
This article has been archived and is no longer updated by Apple.
You insert the cover plug into iPod's Dock Connector port on the bottom of iPod. This plug protects the connector, and keeps foreign matter out of the opening.

Figure 1 Dock Connector port plug

To put iPod in its dock, or to connect the Dock Connector to FireWire cable, remove the plug. iPod will not fit into its dock when the plug is installed.

iPod: About the Carrying Case With Belt Clip

Learn about the iPod carrying case with belt clip and how to distinguish between the different models.

This article has been archived and is no longer updated by Apple.
The iPod carrying case with belt clip protects iPod from the elements and enhance its portability. It is made of high-quality Schoeller woven nylon. It has a steel belt clip that allows you to clip iPod to a belt, purse, or backpack.

There are three models of the carrying case. Each model is designed to work with certain iPod models.

To distinguish between the carrying cases, look for the number on the back of the tag sewn into the top of the case.

You can identify iPod carrying case models by these tag numbers:

- 1
  Compatible with iPod (Touchwheel 10 GB), iPod photo (40 GB), and iPod photo (60 GB)
- 2
  Compatible with iPod (5 GB), iPod (10 GB), and iPod (Touchwheel 20 GB)
- 3
  Compatible with the iPod (10 GB with Dock Connector), iPod (15 or 20 GB with Dock Connector), iPod (30 or 40 GB with Dock Connector) and iPod (40 GB Click Wheel)
- 4
  Compatible only with the iPod (20 GB Click Wheel)

Not all iPod models include the carrying case with belt clip. You can purchase a carrying case from the Apple Store.

Tip: The carrying case ships in a case cover. While this cover is not designed to hold iPod, you can use it to polish iPod.

iPod: Use USB 2.0 with Dell Inspiron 8500

The iPod (with Dock Connector) and the iPod mini does not sync to Dell Inspiron 8500 computers when you use the FireWire ports.
This article has been archived and is no longer updated by Apple.
Connect to the Dell Inspiron 8500 Laptop using the computer's USB 2.0 ports. Note: This workaround requires the iPod Dock Connector to FireWire + USB 2.0 cable, which is sold separately.

iPod mini users can connect with the included Dock Connector to USB 2.0 cable.

Mac OS X 10.2: softwareupdate man Page

The man page (System Manager's Manual) for the softwareupdate command is not installed with Mac OS X 10.2 through 10.2.6. This document is a copy of the man page for the 10.2 version of softwareupdate

This article has been archived and is no longer updated by Apple.

```
SOFTWAREUPDATE(8)           System Manager's Manual
SOFTWAREUPDATE(8)

NAME
    softwareupdate - system software update tool

SYNOPSIS
    softwareupdate [item ...]

DESCRIPTION
    Software Update checks for new and updated versions of your software
    based on information about your computer and current software.

    If you give no arguments, a list of available software updates is
deter-
    mined and displayed.  Each entry includes the item name, description,
    version, and size.

    For each item name you give, the corresponding software update is down-
    loaded, unarchived, and installed.

    softwareupdate must be run as root.

EXAMPLES
    The following example shows how to give items to the shell:

    softwareupdate

          Software Update found the following new or updated software:
           - ExampleUpdate
                  My Example Software (5.0.2), 1292K

    softwareupdate ExampleUpdate

iPod (with Dock Connector): Does Not Play AIFF Files Copied From CD

AIFF files you copied from an audio CD don't play on the iPod (with Dock Connector) model.
This article has been archived and is no longer updated by Apple.

Symptom

AIFF files you copied from an audio CD in the Finder don't play on the iPod, but they play OK in iTunes.

Solution

When you copy an audio track from an audio CD using the Finder, the result is an AIFF file that iPod cannot play. However, iPod can play the audio tracks if you import them as AIFF file in iTunes instead. For instructions, see technical document 93118, "**iTunes 4: How to Choose Import Options**."

Important: iTunes software may be used to reproduce materials. It is licensed to you only for reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce. If you are uncertain about your right to copy any material you should contact your legal advisor.

iPod battery frequently asked questions (FAQ)

This article has been archived and is no longer updated by Apple.

Read below answers to the most frequently asked questions about iPod's battery. For additional information, see the Apple Batteries website.

Questions answered in this document:

1. What kind of battery does iPod have?
2. How long does the battery last?
3. How long does it take to charge the battery?
4. How do I charge my iPod's battery?
5. Do I need to "prime" my iPod's battery by letting it charge for 24 hours before I use it the first time?
6. Do I need to completely empty the battery before charging it, and does doing this prevent the so-called "memory effect"?
7. Should I leave iPod connected to the charger or in the dock whenever I'm not using it?
8. Is it better to empty the battery before charging it, or can I charge it whenever it's convenient?
9. Can I charge the battery when traveling abroad?
10. How long can iPod's battery keep a charge without being used?
11. Why does iPod stop playing even though the battery indicator says there's power left?
12. How can I tell if my iPod's battery is working correctly?
13. Why doesn't my iPod's battery last as long as it should?
14. Does the battery ever wear out?
15. What is a "charge cycle"?
16. Can I get the battery replaced?

1. **Question**: What kind of battery does iPod have?
   Answer: iPod and iPod mini have built-in, rechargeable lithium-ion batteries. For more information about this battery technology, see the Apple Batteries website.

2. **Question:** How long does the battery last?
   Answer: When new and fully charged, the battery provides up to 8 or 12 hours of battery life, depending on your model. For additional information see "Tips and tricks to get the most out of your iPod's battery".

3. **Question:** How long does it take to charge the battery?
   Answer: Fully charging the battery takes about 4 hours. You can also fast-charge the battery to 80 percent capacity in 1 hour (2 hours for iPod (Click Wheel)). Charging the battery may take longer if you're using iPod as it charges.

4. **Question:** How do I charge my iPod's battery?
   Answer: The easiest way is to connect it to the Apple iPod Power Adapter. You can also charge it by connecting iPod to your computer or putting it in its optional dock. For additional information, see "Charging iPod's internal battery"

5. **Question:** Do I need to "prime" my iPod's battery by letting it charge for 24 hours before I use it the first time?
   Answer: No. Just charge the battery until the indicator says the battery is full.

6. **Question:** Do I need to completely empty the battery before charging it, and does doing this prevent the so-called "memory effect"?
   Answer: You don't need to empty the battery before charging it. Lithium-based batteries, like those used in iPod, have none of the memory effects seen in nickel-based rechargeable batteries.

7. **Question:** Should I leave iPod connected to the charger or in the dock whenever I'm not using it?
   Answer: The battery stops charging when it's full. Leaving it connected won't charge it any more. It's perfectly OK to leave it connected so it can charge overnight, for example.

8. **Question:** Is it better to empty the battery before charging it, or can I charge it whenever it's convenient?
   Answer: You can charge iPod's battery whenever it's convenient.

9. **Question:** Can I charge the battery when traveling abroad?
   Answer: Absolutely. The Apple iPod Power Adapter can accommodate the common electrical standards used throughout the world. To make it easy, consider purchasing the World Travel Adapter Kit so you'll always have the right set of plugs for the many outlets you're bound to encounter. The kit also works with most iBook and PowerBook G4 power adapters.

10. **Question:** How long can iPod's battery keep a charge without being used?
    Answer: The standby time is 1 month when fully charged. After a month of not being used, the battery will likely be fully discharged. You may find that the battery is empty before then, and that's normal. Even when it's not being used, iPod uses a small amount of battery power.

Lithium-ion batteries need to be used for maximum performance. If you don't use your device often, be sure to complete a charge cycle at least once per month.

11. **Question:** Why does iPod stop playing even though the battery indicator says there's power left?
    Answer: The battery indicator is only an approximation of the amount of power that's left. For more information, see "iPod's battery indicator is approximate".

12. **Question:** How can I tell if my iPod's battery is working correctly?
    Answer: You can perform a simple test to tell if your battery is working properly. Follow the steps in "iPod's battery indicator is approximate".

13. **Question:** Why doesn't my iPod's battery last as long as it should?
    Answer: See "Tips and tricks to get the most out of your iPod's battery" for information on how to extend your battery life.

14. **Question:** Does the battery ever wear out?
    Answer: Rechargeable batteries have a limited number of charge cycles and may eventually need to be replaced. Battery life and number of charge cycles vary by use and settings. As with other rechargeable batteries, you may eventually need to replace your battery.

15. **Question:** What is a "charge cycle"?
    Answer: Lithium-ion batteries can be charged a finite number of times, as defined by charge cycle. A charge cycle means using all of the battery's power, but that doesn't necessarily mean a single charge. For instance, you could listen to your iPod for a few hours one day, using half its power, and then recharge it fully. If you did the same thing the next day, it would count as one charge cycle, not two, so you may take several days to complete a cycle. Each time you complete a charge cycle, it diminishes battery capacity slightly, but you can put your iPod's battery through many charge cycles before it will only hold 80 percent of its original battery capacity.

16. **Question:** Can I get the battery replaced?
    Answer: Yes. All models of iPod are covered by the Out of Warranty Battery Program. See the iPod battery service FAQ.

If you think you need iPod service for something other than the battery, click here.

How to Clean a Mechanical Mouse

This article explains when and how you should clean a mechanical mouse. It does not apply to the the Apple Pro Mouse.

This article has been archived and is no longer updated by Apple.
You should clean a mouse if it is does not track smoothly, or if it jumps or skips. A mouse contains a small ball that must roll smoothly for the mouse to work properly. You should keep this ball free of dirt and oil by using the mouse on a clean, lint-free surface, and cleaning it occasionally.

Use the following procedure to clean a mouse:

1. Turn off your computer.
2. Turn the mouse upside down and rotate the plastic ring on the bottom counterclockwise to release it.
3. Turn the mouse right side up with one hand and catch the ring and ball with your other hand.
4. Clean the three small rollers inside the mouse with a cotton swab moistened with water. Rotate the rollers to clean all around them. If there is a build-up of material on the rollers that the cotton swab does not remove, you can use your fingernail to gently remove the material.
5. Wash the mouse ball in soapy, warm water with a mild soap such as a dishwashing liquid if oil from your hands has collected on it. Be sure to dry the mouse ball thoroughly.
6. Gently blow into the mouse case to remove any accumulated dust.
7. Put the mouse ball back in the mouse case and replace the retaining ring.

If cleaning the mouse as described does not correct your issue, the mouse may need to be replaced. Have an Apple Authorized Service Provider check it for excessive wear or other failure.

WebObjects 4: Deployment FAQ

This article contains frequently asked questions (FAQ) regarding WebObjects 4 Deployment, with answers to those questions. This FAQ does not include questions involving Monitor or MonitorProxy; for Monitor issues, please see the WebObjects 4 Monitor FAQ, **article 70121**.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. Where can I get the latest documentation?
2. What does the $NEXT_ROOT/Library/WebObjects/Configuration/WebObjects.conf file do? How about the /tmp/WebObjects.conf file? What is the difference?
3. How do I go about using multiple Web Servers?
4. For some reason, the public WebObjects.conf file is not being updated by Monitor. Everything is configured correctly, what am I doing wrong?
5. How do I turn on adaptor logging?
6. How do I restart the adaptor?
7. How can I confirm that the adaptor is running?
8. What databases/adaptors are supported by WebObjects Enterprise?
9. How do I configure Microsoft IIS for WebObjects?
10. I've read all the Release Notes and still can't get WebObjects installed and running!

Question 1: Where can I get the latest documentation?

Answer: Current WebObjects documentation is available on the Apple DevWorld WWW server at http://devworld.apple.com/dev/SWTechPubs/Documents/WebObjects/ It is available in HTML and PDF formats.

Documentation is also available as part of your WebObjects installation, at:

file://$NEXT_ROOT/System/Documentation/Developer/WebObjects/ServingWebObjects.pdf
and
file://$NEXT_ROOT/System/Documenation/Developer/WebObjects/PostInstall/PostInstallTOC.html

Question 2: What does the $NEXT_ROOT/Library/WebObjects/Configuration/WebObjects.conf file do? How about the /tmp/WebObjects.conf file? What is the difference?

Answer: $NEXT_ROOT/Library/WebObjects/Configuration/WebObjects.conf is the "Public" WebObjects.conf file. /tmp/WebObjects.conf is the "private" WebObjects.conf file. For more information on public and private WebObjects.conf files, please see **article 70040**.

Question 3: How do I go about using multiple Web Servers?

Answer: To deploy on multiple web servers, the public WebObjects.conf file needs to be distributed to all web server machines. The best technique is to run Monitor on one app server, and rdist or rcp the WebObjects.conf file to all the webservers. That way you do not need to run Monitor on the webserver and you are not forced to NFS mount a single file system. You could have the webservers "pull" rather than push if security is an issue.

Question 4: For some reason, the public WebObjects.conf file is not being updated by Monitor. Everything is configured correctly, what am I doing wrong?

Answer: Check your license. If your license is only for a single application instance, then the public WebObjects.conf file will not be updated and requests for the startup for multiple instances will silently fail.

Question 5: How do I turn on adaptor logging?

Answer: Go to the /tmp directory and create a file called "logWebObjects". Depending on the adaptor and its settings, the amount of time that the resultant log file "WebObjects.log" will be created varies greatly. If it is the CGI adaptor, the next time the adaptor is run, it will check for the log. In fact, everytime the CGI adaptor receives a hit, it will check the current configuration files and the existence of the "logWebObjects" file.

The NSAPI, ISAPI, Apache, and WAI adaptors are set by the compile options in /opt/Apple/Developer/Examples/WebObjects/Source/Adaptors/Adaptor/config.h:

```
#define TPSEC   1       /* expected WO-requests / second */
#define STATLOG (TPSEC*20)      /* check /tmp/logWebObjects counter */
#define ALWAYS_LOG              /* of course, you might want to just always.. */
```

TPSEC defines how many expected WO requests you will receive in one second. STATLOG simply multiples TPSEC by 20 (or whatever number you provide). The result will be how requests the adaptor will receive before stat()'ing for the logWebObjects file. You can always turn on the ALWAYS_LOG define and the logging will begin, even without a logWebObjects file.

Also, remember to check the web server logs. In particular, the Netscape log is pretty good about reporting what the NSAPI adaptor did on startup.

Question 6: How do I restart the adaptor?

Answer: For all adaptors other than CGI, you'll need to restart the web server.

Question 7: How can I confirm that the adaptor is running?

Answer: In the game "Adventure", xyzzy is a "magic command" that allows you to transport yourself between two rooms. Xyzzy is also an option that you can enable when you compile your own adaptor. It provides a very cheap way of checking to see if the adaptor is running and to get some basic information on the adaptor. Once again, in the file:

```
/opt/Apple/Developer/Examples/WebObjects/Source/Adaptors/Adaptor/config.h:
```

set the option:

```
#define XYZZY   "xyzzy"
// #undef XYZZY
```

After recompiling the adaptor, and restarting the web server, try entering a URL such as:

http://your_web_server/cgi-bin/WebObjects/xyzzy

The following output is an example of what you'll see:

```
Server Adaptor: Server = Netscape/NSAPIWebObjects
Server Adaptor version = 4.0
Load balancing algorithm = roundrobin
Custom Adaptor File Name = libapple.so
Custom Adaptor File Version Name = 1.1
Customer Adaptor Config File Name = dflink.conf
Configuration File Path = WebObjects/Configuration/WebObjects.conf
Log File Name = WO.log
Log File Flag = logWOHeaders
```

Question 8: What databases/adaptors are supported by WebObjects Enterprise?

Answer: Apple provides Sybase, Oracle and generic ODBC adaptors for most versions of WebObjects. Third-party adaptors may be available for other databases, including Informix, Quickbase, AS/400, Supra, DB2, Gupta SQL Base, VSAM, ADABAS, IMS/DB, and NCR Teradata. Other databases may be accessed programmatically through custom libraries provided by your database vendor.

Question 9: How do I configure Microsoft IIS for WebObjects?

Answer: If you're using Microsoft IIS or PWS as your HTTP server, The CGI user must have Administrator privileges to access the NEXT_ROOT environment variable. This is necessary if you want to enable load balancing (distributing the processing load among multiple instances of a WebObjects application). Load balancing is a performance feature that you'd use on a deployment site.

To grant Administrator privileges to the CGI user, do the following:

- Open the "User Manager for Domains" application under Administrative Tools.
- Double-click the entry with the full name "Internet Guest Account." (The user name usually starts with "IUSR_".)
- In the window that opens, click the Groups button.

You'll see two tables, one called "Member of" and one called "Not member of."

- Move the Administrators group from the "Not member of" table to the "Member of" table.
- Click the OK button.

Question 10: I've read all the Release Notes and still can't get WebObjects installed and running!

Answer: It seems that on some systems the /tmp or C:\\TEMP directories either don't exist or don't have read/write permissions set correctly. Be sure the directory can be seen and accessed by all. WebObjects, other apps and users need access to this directory to work properly. On Windows NT, also make sure that your environment variables (TMP and TEMP) are set to C:\\TEMP.

WebObjects: WebObjects And the Browser Stop Button

This document discusses what happens when a user presses the browser's "Stop" button during a WebObjects session. This document assumes that you are using WebObjects 4 or WebObjects 4.5.
This article has been archived and is no longer updated by Apple.
Whether because of complex processing or network load, some WebObjects requests may take a long time to execute. If the user presses their browser's "Stop" button during one of these requests, what happens to the WebObjects application?

In this case, the server has no way of knowing that the user has pressed the stop button; it will continue to process the request and return the response page. This page will then be ignored or discarded by the browser. As a result, there could be a state synchronization issue between the client and the server. If the WebObjects application is storing state on the server, this will always be the case; the user will still see the original page, but the WebObjects application on the server will think that the client has moved on to the next page. This gives the same result as if the client had pressed the "Back" or "Previous" button on their server and accessed a cached page.

In most cases, where state is stored on the client, in cookies or hidden fields, the stop button will have no effect on the session. However, it is possible that a cookie which is storing state could be updated without the page being updated; this would cause a similar synchronization issue to that caused by the server-side state storage discussed above.

Whether state is stored on the client or on the server, there will be no other ill effects caused by the stop button; the WebObjects application will complete its normal request-response loop and remain in a normal post-processing state until it receives another request. In general, if you know that a particular operation will take a long time to complete, consider using the **WOLongResponsePage**. This will immediately return a page asking the user to wait and optionally displaying the status of a request. For more information on WOLongResponsePage, see the class documentation or the LongRequest example that is part of the WebObjects 4 distribution. For more information on dealing with state synchronization issues and the browser "Back" button, see the state management sections of the WOInfoCenter.

WebObjects 3.5.1 Java Bridge Troubleshooting Guide

This document describes some common problems developers may encounter when using the Java development components of WebObjects 3.5.1, and suggests some ways to work around them.
This article has been archived and is no longer updated by Apple.
There are several steps you can follow to resolve or avoid crashes in your Java applications:

Use the best Java Bridge you can

Developers who make extensive use of Java should consider upgrading to WebObjects 4. In addition to bug fixes, the Java Bridge included with WebObjects 4 has enhanced control of asynchronous garbage collection. New features in the WebObjects 4 Java Bridge may allow you to correct problems that may not be fixable with WebObjects 3.5.1.

If upgrading is not an option for your organization, make sure you have the most recent relevant patches installed. The WebObjects 3.5.1 Java Patch 2 contains several Java Bridge bug fixes and should be installed by anyone developing WebObjects applications using Java. For more information, please see the list of current WebObjects patches at:

http://docs.info.apple.com/article.html?artnum=70037

Avoid multiple EOF threads

Some thread safety issues which have been resolved in WebObjects 4 could not be addressed by the WebObjects 3.5.1 patch. You can avoid many JavaBridge-related crashes in a multithreaded EOF application by keeping all of your EOF calls in your main thread.

Increase the Java VM heap size

Java error messages like "StackOverflowError" and "OutOfMemoryError" can be caused by an overflow of the Java Virtual Machine's heap memory. By default, the heap size is 16 MB. Each increase of 16 MB corresponds to an increase of 1,300-1,500 additional active sessions for an average WebObjects application. Apple recommends that you set your Java VM heap size as high as your system resources permit:

```
//Assume that the JavaVM framework is included with your project
// Add this code to your MyApplication_main.m file

#import <JavaVM/NSJavaVirtualMachine.h>

int main(int argc, const char *argv[])
{
NSAutoreleasePool* myPool=[NSAutoreleasePool new];
       NSMutableDictionary* myArguments=[NSDictionary
dictionaryWithObjectsAndKeys:
[NSNumber numberWithInt:32*1024*1024], @"NSJavaMinHeapSize",
               [NSNumber numberWithInt:64*1024*1024], @"NSJavaMaxHeapSize",
nil];
       [NSJavaVirtualMachine setDefaultVirtualMachineArguments:myArguments];
       return WOApplicationMain(@"Application", argc, argv);
}
```

For a complete list of arguments for NSJavaVirtualMachine, see **NSJavaVirtualMachine.h** in the **JavaVM.framework** headers.

Avoid asynchronous garbage collection

Java error messages like "NoSuchMethodError" and "nukeObjCObject" may be caused by the asynchronous garbage collector releasing inappropriate objects. Ordinarily, asynchronous garbage collection will be triggered automatically when the Java VM heap is full. If your heap size is large enough, you can avoid asynchronous garbage collection completely by periodically initiating garbage collection at the end of a request. The following source code explains how to manually initiate the garbage collector every twentieth request, looping through the procedure three times to ensure that all dependent objects are released. You should experiment with different values for the collection frequency and loop count to determine the optimal values for your application.

Add this code to your Application.java file:

```
public Response handleRequest(Request request) {
      Response response = super.handleRequest(request);
       requestsCount++;
          if (requestsCount % 20 == 0) {
               FullGarbageCollection();
```

```
            }

          return response;
       }
```

Also, modify the FullGarbageCollection code to include a bridge crossing:

```
  private static void FullGarbageCollection() {

    for (int i=1; i<3; i++) {      // 3 here could be changed
       Runtime runtime = Runtime.getRuntime();
       long isFree = runtime.freeMemory();
       long wasFree;
       do {
           wasFree = isFree;
           runtime.gc();
           isFree = runtime.freeMemory();
       } while ( isFree > wasFree );
       runtime.runFinalization();

       // WARNING: The following line is necessary in order to ensure
       // that the ObjC counterparts of any collected hybrid objects
       // are released (and subsequently dealloc'ed) to clear any weak
       // references. This happens when the main thread crossed the
       // bridge during the wrapped call.
       application();
     }
   }
```

Retain Java arrays

If a Java method returns a new Java array which is not referenced outside the scope of that method, the Java garbage collector may remove it while its Objective C counterpart is still in use. This will result in an Objective C error messages indicating that a message was sent to a freed object, or a "selector not recognized" error message from the enclosing object when a message is sent to the released object. To avoid this problem, explicitly retain the Java array, vector, or other affected object:

Instead of:

```
public ImmutableVector myVector() {
    _myVector=<some complex calculation>;
    return _myVector;
}
```

Do this:

```
ImmutableVector _myVector;
public ImmutableVector myVector() {
    _myVector=<some complex calculation>;
    return _myVector;
}
```

Explicitly release autorelease pools

If you create an autorelease pool in your Java code, be sure that you release it manually. For example, if you write the following code:

```
Incorrect()
{
  AutoreleasePool pool = new AutoreleasePool();
  /* function implementation */
  /* forget about pool, leaving it for the gc to clean up */
}
```

the objects in the autorelease pool could be released at any point during the execution of the function. Instead, ensure that your autorelease pool is always released manually, even if an exception is encountered:

```
Correct()
```

```
{
  AutoreleasePool pool = new AutoreleasePool();
  try
  {
     /* function implementation */
  }  finally {
     pool.release();
  }
}
```

In general, you should only create autorelease pools in Java in WebObjects 3.5.1 if you need extremely fine control over the lifetime of objects.

Always call super.finalize()

The **finalize()** method is called by the Java garbage collector before deallocating your object. If any of your hybrid Java objects implement finalize(), the implementation must call **super.finalize()** to avoid potentially serious memory leaks. In addition, you should never make a call in a finalize() method that could result in a method invocation across the bridge.

Catch all constructor exceptions

When instantiating a wrapped or hybrid object, checking for a non-null return from your constructor method is not enough. Always use a try/catch statement to ensure that an instantiation error will throw an exception.

WebObjects 3.5.1 Patch 3 Overview

This patch is now obsolete. Please see the WebObjects Current Patch List, article **70037**, for information on the most current patches for WebObjects and Enterprise Objects Framework. This obsolete patch is provided here as a convenience to our customers who have not yet upgraded to the most current patch level.
This article has been archived and is no longer updated by Apple.

About WebObjects 3.5.1 Patch 3

This patch contains a number of bug fixes affecting the Java components of WebObjects 3.5.1. This patch and **EOF 2.2 Patch 2** include all bugs fixed in WebObjects 3.5.1 Java Patch 2. Apple recommends this patch for anyone developing or deploying WebObjects 3.5.1 Java applications on Windows NT or Solaris. For more detailed information on this patch, please see the sections "New Features" and "Problems Fixed" below. For important general information on avoiding problems with Java code under WebObjects 3.5.1, please read **TIL article 70035**.

Installing WebObjects 3.5.1 Patch 3 on Windows NT 4.0

1. Download the Windows NT version of the patch from Apple's FTP site at ftp.info.apple.com. Also **download** the installer script, "patcher.nt.sh".

2. Log in as a user with Administrator privileges.

3. Open a Bourne shell. The Bourne shell should be available from your Start menu, under the WebObjects program group, or under your Apple root directory at NextLibrary\\Executables\\sh.exe.

4. Change to the directory containing the patch and the patch installer, "patcher.nt.sh".

5. Type the following at the shell prompt (make sure that there are no WebObjects applications running first):

```
./patcher.nt.sh -install WOF351_NT_Patch3.TAR.gz
```

For more information on using the "patcher.nt.sh" program, type the following at the command prompt:

```
./patcher.nt.sh -help
```

6. Reboot your Windows NT system

Installing WebObjects 3.5.1 Patch 3 on Solaris

1. Download the Solaris version of this patch from Apple's FTP servers at ftp.info.apple.com. Also **download** the installer script, "patcher.sh".

2. Log in as root. If you're not sure how to log in as root, see your system administrator.

3. Change to the directory containing the patch and the patch installer, "patcher.sh".

4. Type the following at the shell prompt (make sure that there are no EOF applications running first):

```
./patcher.sh -install WOF351_Solaris_Patch3.TAR.Z
```

For more information on using the "patcher.sh" program, type the following at the command prompt:

```
./patcher.sh -help
```

5. Reboot your Unix system

New Features

New in WebOjects 3.5.1 Patch 3

JDK 1.1.6: WebObjects 3.5.1 shipped with version 1.1.3 of Sun's Java Development Kit. This patch upgrades the JDK to version 1.1.6. The new version contains a number of bug fixes, performance improvements, internationalization improvements, and other enhancements. See Sun's JDK 1.1.6 web pages at http://java.sun.com/products/jdk/1.1.6/ and http://java.sun.com/products/jdk/1.1/CHANGES for details on JDK 1.1.6 and the changes from previous versions.

New in WebObjects 3.5.1 Java Patch 2

Java VM arguments: You may now pass "command line" arguments to the Java Virtual Machine. This is particularly useful for increasing the memory allocation pool (the garbage collected heap), which defaults to a maximum size of 16 MB. You should increase the pool size if you receive a java.lang.OutOfMemoryError exception.

Here is some sample code showing how to pass these arguments. Be sure to add the JavaVM framework to your project. In YourApplication_main.m, do something like this:

```
#import <WebObjects/WebObjects.h>
#import <JavaVM/NSJavaVirtualMachine.h>
int main(int argc, const char *argv[])
{
NSNumber *minHeap = [[NSNumber alloc] initWithInt:30*1024*1024];
NSNumber *maxHeap = [[NSNumber alloc] initWithInt:60*1024*1024];
NSDictionary* myArguments = [[NSDictionary alloc]
 initWithObjectsAndKeys:
  minHeap, @"NSJavaMinHeapSize",
  maxHeap, @"NSJavaMaxHeapSize",
  nil];

[NSJavaVirtualMachine setDefaultVirtualMachineArguments:myArguments];
[minHeap release];
[maxHeap release];
[myArguments release];
return WOApplicationMain(@"Application", argc, argv);
}
```

For a complete list of arguments, refer to the NSJavaVirtualMachine.h header in the JavaVM framework.

Problems Fixed

Corrected in WebObjects 3.5.1 Patch 3

Some exceptions not passed across Java Bridge
Apple reference # 2300566

PROBLEM:
If an Objective C exception was raised in an Objective C method called from Java, the bridge correctly converted the NSException to a Java exception and threw it in Java. If the conversion of the NSException itself raised an exception, the subsequent behavior of the application was undefined.

RESOLUTION:
The conversion exception is now caught, both exceptions are logged, and a Java UnknownError is thrown in the Java VM with the message: "Failed to convert Objective C exception to Java exception. Refer to log output for more information."

Java access violation error when bridge cannot find a class
Apple reference # 2303014

PROBLEM:
If a Java exception occurred while WebObjects was attempting to look up a Java class, the exception might not be re-raised in Objective C. If this occurred, the JavaBridge sometimes crashed when it failed to load the wrapper class.

RESOLUTION:
The JavaBridge now raises an appropriate exception in Objective C when a wrapper class can not be found.

Java object creation race condition
Apple reference # 2310235

PROBLEM:
A race condition on Windows NT sometimes allowed the Java garbage collector to reclaim a Java object while it was still needed by Objective C code, resulting in application crashes.

RESOLUTION:
The integration between Java and Objective C during the creation of hybrid objects has been improved to decrease the likelihood of premature garbage collection.

Garbage collector frees wrapped objects prematurely
Apple reference # 2310270

PROBLEM:

When a wrapped Objective C object was created in a Java method, the Objective C proxy object was not retained. Java garbage collection could then release this object while it was still in scope.

RESOLUTION:
Objective C proxy objects are now retained until the appropriate autorelease pool is deallocated.

next.util.CalendarDate constructors calculate year values incorrectly
Apple reference # 2310340

PROBLEM:
Under WebObjects 3.5.1, next.util.CalendarDate constructors did not correctly handle the two-digit year values returned by by the Java Date class' getYear() method, causing CalendarDate objects to be constructed with incorrect year values..

RESOLUTION:
These next.util.CalendarDate constructors now calculate year values correctly.

Java Bridge fails when an Objective C constructor returns nil
Apple reference # 2310395

PROBLEM:
The Java Bridge did not correctly handle the case where the Objective C base of a hybrid object returned nil from its Objective C init method.

RESOLUTION:
In this case, a NullPointerException is now raised in Java. This fix included a change to one of the header files used by the "bridget" utility. All Java projects must be rebuilt to take advantage of this fix. Please note that your code still needs to wrap Java constructors in try/catch statements to catch instantiation exceptions; see **article 70035** for more details.

NSUnicodeStrings not correctly converted by Java Bridge
Apple reference # 2310656

PROBLEM:
In WebObjects 3.5.1, NSUnicodeStrings were not correctly converted into Java strings.

RESOLUTION:
Unicode strings are now detected and correctly converted into Java strings.

AutoreleasePool.finalize() releases Objective C autorelease pool
Apple reference # 2310883

PROBLEM:
The next.util.AutoreleasePool.finalize() method contained code that released the underlying Objective C autorelease pool. Although the intention of this code was to prevent leaks, it could result in an Objective C autorelease pool being released unexpectedly by routine Java garbage collection if a reference to the Java pool was not held.

RESOLUTION:
The Objective C autorelease pool is no longer released in AutoreleasePool.finalize(). If AutoreleasePool.release() is not explicitly called, the underlying Objective C pool will leak into its containing pool. Refer to **article 70035** for more information about proper use of autorelease pools in Java.

Corrected in WebObjects 3.5.1 Java Patch 2

DecimalNumber: Several of the next.util.DecimalNumber arithmetic methods raised exceptions when called. These methods now work properly.

CalendarDate: The next.util.CalendarDate constructor CalendarDate(java.util.Date date) would sometimes return an incorrect date. This has been fixed.

NoSuchMethodError exceptions: WebObjects applications written in Java would occasionally raise a java.lang.NoSuchMethodError exception, when the method did in fact exist. This was caused by a race condition on the interaction between Objective C's reference counting and Java's garbage collection. This has been fixed. These exceptions could also be raised if a subclass of next.eo.CustomObject did not implement a default constructor (that is, an -init method with no parameters). Chained initializer methods would give the same result if some of the methods in the chain did not have Java equivalents. After installing this patch, a missing default constructor will generate a more meaningful error message.

Java string retain crashes: A problem was fixed where Java strings were garbage collected before WebObjects had a chance to retain them. The missing strings caused some applications to crash under heavy use.

Multiprocessor crashes on Solaris: Because of improper use of lock files, WebObjects 3.5.1 applications would sometimes crash on multiprocessor Solaris machines. This behavior is fixed in this patch.

Incorrect cloning behavior: Previously, custom Java objects did not correctly implement the Cloneable interface. With this patch installed, subclasses of NextObject and CustomObject should be cloneable.

DirectToWeb application crashing: The previous version of this patch for Windows NT caused crashes when launching a DirectToWeb application. This has been corrected in the current patch release.

EOEditingContext can now retain all referenced objects: EOEditingContext's weak references to objects caused problems with Java's multithreaded garbage collection. If you are writing an application which accesses the Enterprise Objects Framework from Java, you may encounter two problems:

- EOEditingContext's processing of an EO's deallocation notification is not thread safe
- An object that is no longer retained by your application but has not been deallocated may be refetched. However, the reference may be reestablished too late to prevent the object from being deallocated.

In order to solve this problem, we have made it possible for EOEditingContext to retain all of its objects. Two class methods have been added:

```
+ (void)setInstancesRetainRegisteredObjects:(BOOL)flag;

+ (BOOL)instancesRetainRegisteredObjects;
```

If instancesRetainRegisteredObjects is YES, newly created EOEditingContexts will retain any EOs that it is observing. The default value for this flag is YES if an application contains Java, and NO otherwise. Each EOEditingContext caches the value of this flag, so it is possible to switch from one state to the other midway through your application. Note that only newly created EOEditingContexts will be affected by the flag.

In order to collect the EOs, you must either deallocate the editing context, or call the new method:

```
- (void)reset;
```

on the editing context. Calling reset causes the editing context to forget and release all of the objects that it is watching, and makes all of those objects effectively unusable. You typically will not not have to do anything to a Java WebObjects application in order to be compatible with this new behavior. A session's defaultEditingContext will get collected when the session times out, releasing all of the EOs fetched by that session.

WebObjects: Current patch list

This article has been archived and is no longer updated by Apple.

This document discusses the current updates for various versions of WebObjects. Click the links for detailed information about each patch. To determine which updates are installed on your computer, see:

- 70148: "WebObjects: Using Fingerprint Files" for Solaris and HP-UX.
- 70074: "WebObjects: Determining the Installed WebObjects Version" for Mac OS X and Windows.

WebObjects 5.3

WebObjects 5.3 users should install the following update:

- WebObjects 5.3.1: This update adds a modified Developer tools license, improves the Xcode EOModeler plug-in, improves WebObjects Builder workflow, and includes general improvements.
- WebObjects 5.3.2: This update improves security and deals with incompatibilities with Xcode 2.4.
- WebObjects 5.3.3: This update includes 2007 time zone information that changes the start of Daylight Saving Time in several countries. This update is *strongly recommended* for all WebObjects 5.3 applications.

WebObjects 5.2

WebObjects 5.2 users should install the following updates:

- WebObjects 5.2.1 : This update contains general improvements for WebObjects 5.2 on all platforms. It is recommended that WebObjects users on all platforms install this update.
- WebObjects 5.2.2: This update is recommended only for WebObjects customers who want to use Mac OS X 10.3 (Panther), use JDK 1.4.1, or deploy their applications on JBoss servers.

  The Mac OS X edition of WebObjects 5.2.2 adds support for, and requires, Mac OS X 10.3 (Panther). The Mac OS X, Windows, and Solaris editions all add support for, and require, Java 1.4.1. All versions add support for JBoss deployment, and also include several improvements.

- WebObjects 5.2.3: This update contains general improvements for WebObjects 5.2 on all platforms. It is recommended that WebObjects users on all platforms install this update. The WebObjects 5.2.3 release officially supports Java 1.4.2.
- WebObjects 5.2.4: This update is for users who plan to develop their WebObjects applications on Mac OS X 10.4 using the Xcode development tool suite, or plan to deploy their WO 5.2 applications on Mac OS X Server 10.4. Windows and Solaris users should also install this update.

WebObjects 5.1

WebObjects 5.1 users on all platforms should install one or more of the following updates:

- WebObjects 5.1.4: This update resolves incompatibilities between WebObjects 5.1.x Developer and Mac OS X 10.2, and is required to run WebObjects 5.1.x Developer on this version of the operating system.
- WebObjects 5.1.3: This update contains targeted improvements for WebObjects 5.1 on all platforms. Apple does not recommend that all customers install this update. Only customers who are affected by one or more of the issues described in the release notes should install this update.
- WebObjects 5.1.2: This update contains general improvements for WebObjects 5.1 on all platforms. It is recommended that WebObjects users on all platforms install this update.

WebObjects 5

WebObjects 5 users on all platforms should install one of the following updates:

- WebObjects 5 Update 3: This update contains improvements for WebObjects 5 on Mac OS X (Server) 10.1, and is required to run WebObjects on this version of the operating system.
- WebObjects 5 Update 2: This update contains general improvements for WebObjects 5 on Mac OS X (Server) 10.0.4, Windows, and Solaris. It is recommended that WebObjects users on these platforms install this update. If you want to run WebObjects on Mac OS X 10.1, you should install WebObjects 5 Update 3 instead.

WebObjects 4.5.1

WebObjects 4.5.1 users should install the following update:

- WebObjects 4.5.1 Update 4: This update contains general improvements for WebObjects 4.5.1 on all platforms. It is recommended that WebObjects users on all platforms install this update. Since it includes all changes made in earlier updates for WebObjects 4.5.1, you only need to install this update.

WebObjects 4.5

WebObjects 4.5 users should install one of the following updates:

- WebObjects 4.5 Update 3**:** This update contains general improvements for WebObjects 4.5 on all platforms. It is recommended that WebObjects users on all platforms install this update. Since it includes all changes made in earlier updates for WebObjects 4.5, you only need to install this update.
- WebObjects 4.5 Update 1**:** This update contains improvements for WebObjects 4.5 on Windows 2000, and is required to run WebObjects on this operating system. This update contains the minimal set of changes needed to run WebObjects 4.5 on Windows 2000, but these are included in WebObjects 4.5 Update 3.

WebObjects 4 and EOF 3.0

WebObjects 4.0.1 users should install one of the following patches:

- WebObjects 4.0.1 Patch 2--This patch contains general improvements for WebObjects 4.0.1 on all platforms except for Mac OS X Server 1.2. WebObjects users on Mac OS X Server 1.0 and HP-UX should install this patch. Mac OS X Server 1.2, Solaris, and Windows NT users should install Patch 3.
- WebObjects 4.0.1 Patch 3--This patch contains general improvements for WebObjects 4.0.1 on Mac OS X Server 1.2, Solaris, and Windows NT. It is recommended that WebObjects users on these platforms install this patch.

WebObjects 3.5.1 and EOF 2.2

WebObjects 3.5.1 users on all platforms should install the following patches:

- WebObjects 3.5.1 Patch 4--This patch corrects a number of issues with the WebObjects 3.5.1 frameworks, including Year 2000 date rollover issues. Includes patches for Solaris, HP-UX, and Windows NT, and documentation for OPENSTEP 4.2 for Mach.
- EOF 2.2 User Patch 3 and EOF 2.2 Developer Patch 2--This patch contains improvements for Apple's Enterprise Objects Framework and includes fixes from several previous patches, including fixes for Java issues. . It should be installed by Windows NT users only. Solaris users should install EOF 2.2 Patch 2 instead. OPENSTEP for Mach and HP-UX users should install EOF 2.2 Patch 1 instead.
- EOF 2.2 User Patch 2 and EOF 2.2 Developer Patch 2--This patch contains improvements for Apple's Enterprise Objects Framework and includes fixes from several previous patches, including fixes for Java issues. . It should be installed by Solaris users only. OPENSTEP for Mach and HP-UX users should install EOF 2.2 Patch 1 instead.
- EOF 2.2 Patch 1--This patch contains improvements for Apple's Enterprise Objects Framework and includes fixes from several previous patches. It should be installed by OPENSTEP for Mach and HP-UX users only. This patch includes developer and deployment components.
- WebObjects 3.5.1 Monitor Patch--This patch corrects a number of issues with the Monitor application which shipped with WebObjects 3.5.1.

In addition, there is a procedure that some WebObjcts 3.5.1 users may wish to follow depending on their platform and needs: Revised RebuildWODefaultApp Script. This allows developers to access EOF from pure-WebScript WebObjects applications

WebObjects 3.1 and EOF 2.1

WebObjects 3.1 users on all platforms should install the following: WebObjects 3.1 Patch 1. This patch corrects a number of issues with the WebObjects 3.1 frameworks, including Year 2000 date rollover issues. Includes patches for Solaris, HP-UX, and Windows NT, and documentation for OPENSTEP 4.2 for Mach.

WebObjects 3.0 and EOF 2.0

Note: Apple is allowing Enterprise Objects Framework version 2.0 users to upgrade to a patched version of EOF 2.2 at no cost. Details on the upgrade and the patch will be posted here in the near future. Apple recommends this upgrade for all users of EOF 2.0.

There are no general patches available at this time for users of WebObjects 3.0.

These patches affect users of EOF 2.0, the version of Apple's Enterprise Objects Framework that shipped with WebObjects 3.0:

TA26697_WebObjects_Current_patch_list.pdf

- EOF 2.0 Adaptor patches for the ODBC, Oracle, and Informix adaptors
- A workaround for an issue with multiple BLOBs under EOF 2.0
- Sybase client libraries for EOF 2.0

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Published Date: Feb 20, 2012

WebObjects and SQL Server 7

The workaround described in this article has been included in WebObjects 4.0.1 Patch 2 and subsequent patches. Please see the WebObjects Current Patch List, **article 70037**, for information on the most current patches for WebObjects and Enterprise Objects Framework. This obsolete article is provided here as a convenience to our customers who have not yet upgraded to the most current patch level.
This article has been archived and is no longer updated by Apple.
Q: I get a crash when I try to use the WebObjects ODBC adaptor to connect to Microsoft SQL Server 7. How can I fix this?

A: This is a known issue with some versions of WebObjects and SQL Server 7. WebObjects 3.5.1 users can avoid this by installing **EOF 2.2 User Patch 2**. An updated version of the WebObjects 4 ODBC adaptor for Windows NT is now available which will work with Microsoft SQL Server 7. This is an **unsupported product** and users should install it at their own risk. Apple will not guarantee or provide support for this package.

To install the modified ODBC adaptor on WebObjects 4:

1. **Download** the adaptor package from Apple's FTP server.

2. Uncompress the ODBCEOAdaptorWO401.tar.gz file. This file contains both the source code and a built version of the ODBC adaptor for WebObjects 4.

3. Copy the file ODBCEOAdaptor.dll from inside the ODBCEOAdaptor.framework directory to <$NEXT_ROOT>/Library/Executables. Be sure to back up the original file first.

4. Copy the ODBCEOAdaptor.framework to <$NEXT_ROOT>/Library/Frameworks. Be sure to back up the original .framework directory first.

You must make clean and recompile existing WebObjects projects against the new frameworks in order to connect to SQL Server 7 databases. This version of the adaptor also corrects issues with case-insensitive database comparisons and the naming of reverse engineered tables. However, Apple recommends this patch **only** for customers who need SQL Server 7 connectivity. This patch was tested with version 3.510.3711.0 of the ODBC core components.

Published Date: Feb 19, 2012

WebObjects 4: Troubleshooting Apache Web Server Deployments

This document describes a problem which can occur with some versions of the Apache web server and WebObjects 4, and explains how to avoid it.

This article has been archived and is no longer updated by Apple.

Q: I'm using WebObjects 4. When I connect to an Apache web server with the WebObjects cgi adaptor, form names and variables are not returned. My application works fine when I run it from Project Builder. How can I make it work with Apache?

A: Some versions of the Apache web server have the **ServerSignature** setting turned on by default. In some cases, this generates http headers that the WebObjects cgi adaptor cannot interpret. To avoid this problem edit your **httpd.conf** configuration file and change the ServerSignature setting from "on" to "off".

Published Date: Feb 19, 2012

WebObjects 4: Setting Java VM Command-Line Arguments

This document discusses methods for configuring the Java Virtual Machine under WebObjects 4. For information on using Java under WebObjects 3.5.1, please see article 70035, **WebObjects 3.5.1 Java Bridge Troubleshooting Guide**.
This article has been archived and is no longer updated by Apple.

Setting Java VM Command-Line Options

Q: How do I pass command-line arguments to the Java VM? I need to increase the garbage heap size, so that my application doesn't run out memory.

A: WebObjects 4 introduces a new way to specify arguments to the Java VM. The following arguments may be specified. Those ending in "Size" or "Port" take number arguments; all others take YES or NO.

- NSJavaCheckSource (equivalent to -cs or -checksource)
- NSJavaNativeStackSize (equivalent to -ss<number>)
- NSJavaStackSize (equivalent to -oss<number>)
- NSJavaMinHeapSize (equivalent to -ms<number>)
- NSJavaMaxHeapSize (equivalent to -mx<number>)
- NSJavaVerifyMode (equivalent to -verify)
- NSJavaEnableClassGC (NO is equivalent to -noclassgc)
- NSJavaEnableVerboseGC (equivalent to -verbosegc)
- NSJavaDisableAsyncGC (equivalent to -noasyncgc)
- NSJavaVerbose (equivalent to -v or -verbose)
- NSJavaDebugging (equivalent to -debug)
- NSJavaDebugPort

There are three ways to set these arguments:

1) Use the defaults command-line tool:
```
defaults write myapp NSJavaMinHeapSize 33554432
```
2) Pass them on the command line:
```
MyApp.woa/MyApp -NSJavaMinHeapSize 33554432
```
3) Set them programatically. Refer to the documentation for **NSUserDefaults** (Objective C) or **com.apple.yellow.foundation.NSUserDefaults** (Java).

Q: After porting a WebObjects 3.5.1 application to WebObjects 4, I receive this message. What should I do?

```
Mar 22 08:23:54 VM[268] NSJavaVirtualMachine: WOF 3.5.1 compatibility method
+setDefaultVirtualMachineArguments: has been called.  This call is no longer
necessary, and will not be supported in the future.  Get your code off it
now!
```

The **setDefaultVirtualMachineArguments:** method was introduced in the WebObjects 3.5.1 Java Patch (see article 70037, **WebObjects Current Patch List** for current WebObjects patch information.) It should only be called on patched WebObject 3.5.1 systems. After porting to WebObjects 4, this call should be replaced by the technique described above.
Published Date: Feb 19, 2012

WebObjects 4: Troubleshooting Error Messages and the WebObjects URL

When debugging a WebObjects application, the error messages you see in your web browser can help you diagnose deployment problems. Once you recognize where the error message is coming from and what the message means, you will be well on your way to solving your problem.

This document explains what each element of the WebObjects URL means, and what error messages a problem with that element might cause. We will examine the URLs of both Direct Connect and web server-based applications.
This article has been archived and is no longer updated by Apple.

The Direct Connect URL

Deploying WebObjects Applications With Direct Connect

WebObjects 4's Direct Connect option allows you to develop and test a WebObjects application without a separate web server. This is the default when you start an application from the command line. This option is useful for developers, because it eliminates the need to run a web server on your development system.

The URL for a DirectConnect application will look something like this:

```
http://localhost:33543/cgi-bin/WebObjects/HelloWorld
```

The Hypertext Protocol

The first part of the URL:

```
http://localhost:33543/cgi-bin/WebObjects/HelloWorld
```

represents the protocol you are using to communicate. The http prefix represents the hypertext transfer protocol and means that you are expecting a response in html format. For a deployed WebObjects application this response will come from a web server; for a direct connect application, it comes from a WebObjects application. If you had misspelled this part of the URL, for example:

```
htpp://localhost:33543/...
```

you would get an error message from your web browser such as:

```
The protocol specified in this address is not valid. Please make sure the address is correct and try again!
```

The browser will raise an error of this kind whenever it doesn't recognize the protocol you request. This error message will vary according to your browser and version.

The Hostname

The next part of the URL:

```
http://localhost:33543/cgi-bin/WebObjects/HelloWorld
```

is the hostname of the machine you are connecting to and the port number to which you're trying to connect. In this case, it is an alias for your local machine. If you mistype the hostname, the Domain Name Lookup performed by your web browser will fail, and you will get an error message something like this:

```
Internet Explorer could not open the Internet site
A connection with the server could not be established
```

or this:

```
Netscape is unable to locate the server
Please check the server name and try again
```

This message is generated by the browser and will vary according to your browser and version.

The Port Number

The hostname for a DirectConnect application is always followed by a port number:

```
http://localhost:33543/cgi-bin/WebObjects/HelloWorld
```

When a WebObjects application is started at the command line, the port number can be specified with the **-WOPort** option.

If there is no WebObjects application running on the port you specify, you will get an error message something like this:

```
Internet Explorer could not open the Internet site
A connection with the server could not be established
```

or this:

```
There was no response.  The server could be down or is not responding.
If you are unable to connect again later, contact the server's administrator
```

This error message comes from the browser and will vary according to your browser and version. This error message may be the same as the error message for an incorrect hostname, above.

Communicating with the DirectConnect Application

If there were a WebObjects application running on port 33543 of your local system, the URL:

```
http://localhost:33543/
```

would connect to it successfully. Since each Direct Connect application will be using a unique port, nothing after the port number is significant when making the initial connection. However, the rest of the URL is very important when you deploy your application on a web server.

The Web Server URL

Deploying WebObjects Applications With a Web Server

While DirectConnect provides a quick way for developers to work with their WebObjects applications, once development is finished the application should be deployed on a web server. The URL of a WebObjects application running on a web server will look something like this:

```
http://webserver.domain.com/cgi-bin/WebObjects/HelloWorld
```

The Protocol And Host

The first part of this URL:

http://webserver.domain.com/cgi-bin/WebObjects/HelloWorld

is the same as for the direct connect URL above. The difference is that here the hostname will be either the numerical or named IP address of the web server:

http://**www.apple.com**/...

or

http://**17.254.0.91**/...

In addition, no port number is given. This means that the web browser will try to connect to the default http port, port 80. If the protocol, hostname or port number is incorrect, you will see the same errors as given above for the direct connect URL.

The cgi-bin Directory

The next part of the URL:

http://webserver.domain.com/**cgi-bin**/WebObjects/HelloWorld

represents the web server's cgi-bin directory. The web server should recognize this as a signal that the next part of the URL is an executable to be run. You can run executables from any path if your web server is configured to do so. Microsoft's IIS web server normally uses the path "scripts" instead of "cgi-bin":

http://webserver.domain.com/**scripts**/WebObjects.exe/HelloWorld

If the web server does not have the cgi-bin path configured to run executables or does not exist you will get an error message such as:

```
Not Found
The requested object does not exist on this server. The link you followed is
either outdated, inaccurate, or the server has been instructed not to let
you have it.
```

This error message is generated by the web server and is usually displayed as a page in the web browser. If you receive this error, check that the server is configured to run executables from the path cgi-bin. The specific steps required will depend on your web server. The web server error log

files will help you to debug this.

The WebObjects Adaptor

The next part of the URL is the name of the executable to run, in this case the WebObjects adaptor:

```
http://webserver.domain.com/cgi-bin/WebObjects/HelloWorld
```

On Windows NT this may be "WebObjects.exe". The error messages you get from the adaptor will vary depending on the specific adaptor module you are using; cgi-bin, NSAPI, ISAPI, or Apache. If you send a URL with the adaptor and no other arguments, you might get a response from the adaptor or an error message from the web server. Instead, to test the adaptor, send a URL with some characters after the adaptor name:

```
http://webserver.domain.com/cgi-bin/WebObjects/someJunktext
```

You will get an error message like:

```
The requested application was not found on this server
```

This message comes from the WebObjects adaptor. Since the adaptor is now running, you can debug adaptor error messages by turning on adaptor logging. This is normally
done by creating a file named logWebObjects in your system's $TEMP folder. On Solaris, for example, you must create the file **/tmp/logWebObjects** as the root user. The adaptor will then start logging information into the file **/tmp/WebObjects.log**.

The WebObjects Application

The last part of the URL:

```
http://webserver.domain.com/cgi-bin/WebObjects/HelloWorld
```

is the name of your WebObjects application. The WebObjects adaptor will check the **public webobjects.conf file** to find instances of an application with this name. If it finds one, it will forward the request to that application. If it does not, it will check the **private webobjects.conf file**. If no instance with the appropriate application name is found in either file, you will see the same error message as when you typed in garbage above:

```
The requested application was not found on this server
```

This error message is generated by the WebObjects adaptor.

If you have the HelloWorld application configured and running, you will see the page generated by the application in your web browser. Once you have connected to the application, you may see additional information at the end of the URL:

```
http://webserver.domain.com/cgi-bin/WebObjects/HelloWorld.woa/wo/3HGN10gz64bjuvic1/0.2
```

This is added to the URL by the WebObjects application and should not be edited by the user.

Conclusion

The web browser, web server, and WebObjects adaptor parse the URL from left to right, only proceeding when there are no errors. Recognizing where the error messages you see in the browser come from can give you valuable clues to where problems exist in your WebObjects deployment.

Published Date: Feb 20, 2012

WebObjects 4.0.1 Frequently Asked Questions

This document answers some common questions about the 4.0.1 release of Apple's WebObjects application server development system.
This article has been archived and is no longer updated by Apple.
Q: What is WebObjects 4.0.1?

A: WebObjects 4.0.1 was released in conjunction with Apple's MacOS X Server operating system. Its most important feature is support for the MacOS X Server platform. However, the release also includes several other enhancements, including more examples, tutorials, and documentation; enhancements to WOInfoCenter; and several high priority bug fixes. See below for details on specific changes made in this release.

Q: How do I get WebObjects 4.0.1?

A: If you're a licensed user of WebObjects 4 on Windows NT, Solaris, or HP-UX, Apple will mail you a CD of WebObjects 4.0.1 automatically. If you received WebObjects 4 as part of the MacOS X Server distribution, or if you received your copy of WebObjects 4 after mid-April, 1999, you already have WebObjects 4.0.1. If you have questions about your status, please contact your Apple sales representative for more information.

Q: What version do I currently have installed?

A: The WebObjects CD has a version number printed on the right-hand side, underneath the platform identifier. It will say either "WebObjects 4.0" or "WebObjects 4.0.1."

Q: I've received my copy of WebObjects 4.0.1, and I already had WebObjects 4.0 installed. Do I need to uninstall my old WebObjects or can I just install WebObject 4.0.1 over it?

A: You must completely uninstall WebObjects 4.0 before installing WebObjects 4.0.1. See the WOInfoCenter for instructions on uninstalling the software.

Q: What changed in WebObjects between the 4.0 and 4.0.1 releases?

A: WebObjects 4.0.1 supports MacOS X Server and Solaris 2.7. There were many changes and corrections made to the tutorials, examples, and documentation, including enhancements to WOInfoCenter itself. A new application, the WebObjectsLicenseKeyUpgrader, was added to make it easier for customers to upgrade their deployment licenses after installation. In addition, the following specific bugs were corrected for this release:

WODefaultAdaptor hangs on stale socket
Apple reference # 2281185

ISSUE:
The WODefaultAdaptor could not recover from a situation where the socket it was using went bad.

RESOLUTION:
The WODefaultAdaptor now recognizes when there is an issue and tries to recreate the socket.

EOPopUpAssociation passes duplicate items to AppKit
Apple reference # 2289602

ISSUE:
If multiple identical items were passed from an EOPopUpAssociation to an AppKit NSPopUpButton, the AppKit object would raise an exception.

RESOLUTION:
EOPopUpAssociation now uniques its contents before passing them to the AppKit.

ODBC date values cause crash
Apple reference # 2289803

ISSUE:
Generating EOF dates from an ODBC database's timestamps would sometimes cause an "invalid date format" error. This was due to an error in the code which rounded ODBC time values from nanoseconds to milliseconds.

RESOLUTION:
EOF now truncates timestamp values instead of rounding them. Optimistic locking and other functions which require timestamp comparison will no longer cause this exception.

Resources missing from preindexed frameworks
Apple reference # 2292280

ISSUE:
If a framework was preindexed, WebObjects Builder would not load any of the project's resources.

RESOLUTION:
WebObjects Builder now recognizes the resources of preindexed projects correctly.

EOProject parser does not recognize some method names
Apple reference # 2292470

ISSUE:
If EOProject's parser encountered a method named just "get" or "set" while checking for accessor methods, an exception would be raised.

RESOLUTION:
The parser now checks for and handles this condition correctly.

EOEditingContext archiving issues
Apple reference # 2297455

ISSUE:
EOEditingContext's encodeWithCoder: and initWithCoder: methods were not thread safe. In addition, under certain conditions, the archive methods could overwrite meaningful changes and result in lost data. These methods would also fail if an object was unarchived from a data store other than the default data store, or if the object being edited was the entry point to the archive.

RESOLUTION:
EOEditingContext's archiving methods have been rewritten to avoid these issues.

EOEditingContext saveChanges() exceptions not propagated to Java
Apple reference # 2297457

ISSUE:
Exceptions raised within EOEditingContext's **saveChanges()** method would not propagate to Java unless they were caused by a validation failure.

RESOLUTION:
These exceptions are now propagated to Java correctly.

Application inactivity timeout is broken
Apple reference # 2297505

ISSUE:
If an inactivity timeout was set for a WebObjects application, the app would crash when the timeout expired.

RESOLUTION:
WebObjects applications will now exit cleanly after the timeout is reached.

Memory leak in WODisplayGroup
Apple reference # 2298170

ISSUE:
WODisplayGroup's -initWithCoder: method leaked a small amount of memory each time it was called.

RESOLUTION:
The leak in this method has been eliminated.

Exception handlers may message freed objects
Apple reference # 2298174

ISSUE:
If an exception was raised and caught by a handler which unlocked an editing context, the exception could be freed before it was reraised. This would cause a fatal error rather than a catchable exception.

RESOLUTION:
EOF's internal exception handlers have been modified to prevent this behavior.

Undo manager not thread safe
Apple reference # 2298337

ISSUE:
When the NSUndoManager was handled at the endOfEvent notification, while it's editing context is unlocked, it was possible for a new request for the same session to come in, causing the same instance of the undoManager to be accessed by two threads at once. This would cause occasional crashes in some high-volume applications.

RESOLUTION:
The endOfEvent notification is now posted before the editing context is unlocked, and these crashes no longer occur.

Sybase adaptor may generate duplicate primary keys for multiple application instances
Apple reference # 2299035
ISSUE:
The Sybase adaptor uses a stored procedure called "eo_pk_for_table" to generate primary key values. Because this stored procedure does not run in a transaction, if two application instances request a primary key simultaneously, they could be assigned the same primary key.

RESOLUTION:
The "eo_pk_for_table" stored procedure now runs in a transaction. Duplicate primary keys will no longer be generated.

Adaptor tries to reconnect to dead instances
Apple reference # 2300000

ISSUE:
The WebObjects adaptor would re-read the WebObjects configuration file even when the compiled adaptor parameters told it not to. A a result, dead instances would come back into the list too often. If adaptor logging were turned on, and an application instance were killed, you could see the adaptor repeatedly trying to re-connect to the app instance, despite its being marked dead.

RESOLUTION:
The WebObjects adaptor now re-reads the configuration file in accordance with the compiled adaptor parameters.

WOLongResponsePage issues in Java apps
Apple reference # 2300113

ISSUE:
Because of a bug in NSJavaVirtualMachine, Java-based applications were not able to use the WOLongResponsePage.

RESOLUTION:
This issue no longer occurs in this release.

Can't open older eomodels with current tools
Apple reference # 2300129

ISSUE:
WebObjects would fail to read archived eomodel files which had been generated by older WebObjects versions.

RESOLUTION:
WebObjects now reads these files correctly.

Cross-model relationships crash EOModeler
Apple reference # 2300382

ISSUE:
EOModeler would crash when the user attempted to close a model with relationships to other models.

RESOLUTION:
EOModeler now handles these relationships correctly.

OBLite Adaptor may contain incorrect typeInfo and modelInfo information
Apple reference # 2301085

ISSUE:
In some cases, the typeInfo and modelInfo information of an OBLite connection dictionary would be corrupted, crashing a customer's application or preventing database access.

RESOLUTION:
Since the typeInfo and modelInfo are the same for every OBLite database, the values have now been hard-coded into the adaptor and can no longer be corrupted.

NT Sybase adaptor compiled with older client libraries
Apple reference # 2301732

ISSUE:
On Windows NT, the Sybase Adaptor shipped with an older version of the Sybase client libraries, which were not certified by Sybase for Year 2000 compliance.

RESOLUTION:
The Sybase client libraries that ship with WebObjects 4.0.1 are an updated version that Sybase has certified as Year 2000 compliant.

Crash when passing null java.math.BigDecimal
Apple reference # 2307624

ISSUE:
If a null value was passed to a wrapped object which was expecting a java.math.BigDecimal, it would crash the application.

RESOLUTION:
WebObjects now checks for null values and handles them correctly.

WebObjects header files conflict with C++ compilation
Apple reference # 2309963

ISSUE:
Some C++ reserved words were used in the WebObjects headers files. This caused serious issues with the compilation of C++ code for WebObjects applications.

RESOLUTION:
Customers can now use hybrid WebObjects Objective C objects in their applications.

Using enumerations with Java causes deadlocks
Apple reference # 2283190

ISSUE:
Using enumerations on Foundation collections from Java would cause deadlocks during garbage collection. This would happen because the enumerator object was being released too early.

RESOLUTION:
The enumerator object is now released at the proper time, and the error no longer occurs.

NSNumber can't accept some valid values
Apple reference # 2211791

ISSUE:
The **numberWithLongLong:** and **numberWithUnsignedLongLong:** constructor methods of NSNumber would fail for very large numbers.

RESOLUTION:
All of NSNumber's constructor methods now work correctly for appropriate values.

Can't compile with Foundation and -ansi flag
Apple reference # 2228578

ISSUE:
The gcc compiler would not compile a class which imported the Foundation framework when the -ansi flag was set. This was due to an omission in one of the framework header files.

RESOLUTION:
The relevant header file has been fixed and these classes now compile correctly.

Date constructors give wrong date for nil input
Apple reference # 2256550

ISSUE:
If the locale argument to the various date classes' **dateWithNaturalLanguageString:locale**: method was nil, incorrect results would be returned because the classes were not correctly determining the language selected by the system.

RESOLUTION:
The date classes now determine the system default locale and return a correct date value.

Files which import NSString.h causes compiler warnings on HP-UX
Apple reference # 2258616

ISSUE:
Because of a naming conflict between NSString.h and NSObjCRuntime.h, compiling any file which imported NSString.h would cause many compiler warnings on HP-UX. This would not affect compilation, but it was annoying and made it difficult to find real compiler errors.

RESOLUTION:
The conflict has been resolved and these errors no longer occur.

NSDateFormatter interprets year "00" as "Current Year"
Apple reference # 2278053

ISSUE:
NSCalendarDate would interpret year "0" or "00" as "current year", rather than "2000", which was inconsistent with the interpretation of two-digit years in UNIX and not Year 2000 compliant.

RESOLUTION:
NSCalendarDate now interprets "0" or "00" year values as "2000"

Bundle class loader loads all classes in main component
Apple reference # 2280719

ISSUE:
The Java VM would become confused when classes in the main bundle are loaded by two different class loaders. This would happen because the Java warmup code in Foundation forced the bundle class loader to load all classes in the main bundle, despite having passed the main bundle's Java resources directory in the class path to the VM. The result would be spurious security and class cast exceptions.

RESOLUTION:
The bundle no longer loads all of these classes, and these errors no longer occur.

Java object notifications not thread safe
Apple reference # 2287349

ISSUE:
Due to timing issues, in multithreaded Java applications notifications would sometimes be sent to freed objects.

RESOLUTION:
The NotificationCenter now uses a locking system to provide full multithreading support.

dateWithYear doesn't accept nil time zone
Apple reference # 2258428

ISSUE:
The NSCalendarDate constructor **dateWithYear:month:day:hour:minute:second:timeZone:** would not accept a nil value for the time zone. If a nil time zone was passed, the constructor would return nil.

RESOLUTION:
A nil value is now interpreted as the current time zone.

NSDate methods calculate incorrect dates across DST boundary
Apple reference # 2281625

ISSUE:
The NSCalendarDate methods **dateByAddingYears:months:days:hours:minutes:seconds:** and **years:months:days:hours:minutes:seconds:sinceDate:** would not handle time zone transitions correctly. Thus, the number of minutes between two dates separated by a daylight savings time boundary was not calculated correctly.

RESOLUTION:

Daylight savings time transitions are now calculated correctly.

Redirected HTTP URL headers are case sensitive
Apple reference # 2287408

ISSUE:
NSURL would not recognize redirections if the HTTP headers were not capitalized correctly.

RESOLUTION:
NSURL now handles the case where redirection headers are improperly capitalized.

WebObjects 4: Changes in Time Zone Information in WebObjects 4

The time zone information, and the Foundation classes that use it, have been updated in WebObjects 4 to the information published by the U.S. Government, current as of October 1998. This document describes the changes to the system time zone information that have occurred since the release of WebObjects 3.5.1.
This article has been archived and is no longer updated by Apple.

General Information Regarding Time Zone Changes

In brief, the update of time zone data underlying the NSTimeZone class cluster in WebObjects 4 includes:

- Addition of new time zones across the world
- Changes in the names of previously-existing time zones
- Addition of new time zone abbreviations across the world
- Changes to daylight saving time algorithms for named time zones, both current and historical.
- Change in notation of time offsets from Greenwich Mean Time to the POSIX minutes-west-of-GMT convention

These are all changes in the raw data received from the U.S. Government. Apple has no control over these changes, which will substantially affect customers whose software relies on time zone information. It is important for customers to understand these changes before upgrading time zone-sensitive software from WebObjects 3.x to WebObjects 4.x in order to assure their success in working with the new data.

For additional general information on time zones, see also:

http://www.cl.cam.ac.uk/~mgk25/iso-time.html

Changes in Foundation's NSTimeZone Class Cluster

The NSTimeZone class cluster was reimplemented between OpenStep 4.2 and WebObjects 4:

- Some methods in NSTimeZone have been deprecated, some have changed.
- New methods have been added to NSTimeZone--refer to the class documentation for details.
- The NSTimeZoneDetail class has been deprecated.
- NSTimeZone and NSCalendarDate objects created in OPENSTEP 4.2/WebObjects 3.5.1 can be unarchived and transmitted via DO to WebObjects 4.x, but the reverse is not true.

Some of the deprecated methods in the NSTimeZone and NSTimeZoneDetail classes still work as before, some have changed behavior. In any case, customers wishing to move forward to WebObjects 4 and future Apple development products need to remove any usage of NSTimeZoneDetail, and of deprecated NSTimeZone methods, from their code as part of the transition.

NSTimeZone

+abbreviationDictionary

Returns an NSDictionary of the new mapping of time zone abbreviations to named time zones. See sections below on mapping of abbreviations to zones.

+localTimeZone

Returns the new time zone object for the local named time zone. For example, if your machine is set to "US/Central" (old) or "America/Chicago" (new), this method will return the NSTimeZone object for the America/Chicago zone. See NSTimeZone class documentation for further details on this method.

+defaultTimeZone

Returns the new time zone object for the local named time zone. See NSTimeZone class documentation for further details on this method.

+setDefaultTimeZone:

No change in behavior.

+timeZoneForSecondsFromGMT:

Returns the GMT offset object for the time value, in seconds, represented by the integer argument. See section "Named Time Zones versus GMT Offsets", below, for important information on changes since OpenStep.

Due to a known problem, this method **does not work** in currently shipping versions of WebObjects 4. No workaround is currently available.

+timeZoneArray

No change in behavior.

Deprecated. There is no replacement for this method.

+timeZoneWithName:

Returns the new time zone object for any old or new time zone name that Foundation recognizes.

Due to a known problem, this method **does not work** on the Windows NT version of WebObjects 4. For a workaround, see **TIL article 70013**.

+timeZoneWithAbbreviation:

Returns the new time zone object for the named zone associated with the abbreviation argument in the Abbreviation.table resource. Use+abbreviationDictionary to get the current association of abbreviation to zone. See sections below on mapping of abbreviations to zones.

-timeZoneName

Returns the new name for the time zone instance. For example, a time zone object created via +timeZoneWithAbbreviation: with an argument of "US/Mountain" will return a name value of "America/Denver".

Deprecated. Replace with -[NSTimeZone name].

-timeZoneDetailArray

Returns an empty NSDictionary.

Deprecated. There is no replacement for this method.

-timeZoneDetailForDate:

No change in behavior; class of return valued changed from NSTimeZoneFileDetail to NSConcreteTimeZone.

Deprecated. Replace with -[NSTimeZone abbreviationForDate:].

NSTimeZoneDetail

-isDaylightSavingTimeZone:

No change in behavior.

Deprecated. Replace with -[NSTimeZone isDaylightSavingTime]

-timeZoneAbbreviation

No change in behavior;

Deprecated. Replace with -[NSTimeZone abbreviation]

-timeZoneSecondsFromGMT

No change in behavior - correctly handles old and new time zone names.

Deprecated. Replace with -[NSTimeZone secondsFromGMT]

The reimplementation of NSTimeZone cluster classes has altered the encoding and archiving of NSTimeZone and NSCalendarDate objects. WebObjects 4.x is able to unarchive and decode (transmit over DO) objects of the classes from OpenStep 4.2 / WebObjects 3.x. However, OpenStep and WebObjects 3.x can not unarchive or receive over DO NSTimeZone or NSCalendarDate objects from WebObjects 4.x.

Regardless of whether archiving or DO is used, mixed testing or deployment environments using both old and new time zone data and classes will be problematic and should be avoided. If the software stores time zone information in a database, old applications reading that database will be unable to interpret the new time zone names stored there by applications converted to YellowBox or WebObjects 4.x.

Named Time Zones versus GMT Offsets

A crucial concept for developers to grasp when working with time zone data is the difference between named time zones and GMT offsets. These are two fundamentally different concepts which can not be used interchangeably.

GMT offsets are absolute distances from Greenwich, England. Although a GMT offset can be constructed with any value, the usual usage divides

the globe into 24 whole-hour units - twelve east of Greenwich and twelve west. The NSTimeZone class constructs GMT offsets from integer arguments representing the number of seconds east (positive integers) or west (negative integers) of Greenwich. GMT offsets do not vary with season, historical year, or political boundary.

Named time zones, such as "US/Eastern" or "Europe/London", do vary with season (daylight saving), historical year (the rules for daylight saving may change for a given time zone, over time), and political boundary (as political boundaries shift and laws change, the date calculations for a particular geographic location may change). The data for named time zones have changed for WebObjects 4--there are numerous corrections and additions to daylight saving rules resulting from improved accuracy in political and historical information and in daylight saving transition formulae.

For named time zones that observe daylight savings, the GMT offset which corresponds to the zone changes at different times of the year. For example, during the observation of standard time, the named time zone which encompasses most of the west coast of the United States (formerly called "US/Pacific", now "America/Los_Angeles") corresponds to the offset seven hours west of GMT. During the observation of daylight savings, this named zone corresponds to the offset eight hours west of GMT. Daylight savings shifts are not always whole hours - some named time zones shift by only one-half hour, some shift by some other fraction of an hour (like 50 minutes).

Not all named time zones observe daylight savings. For these, the GMT offset remains constant throughout the year.

Change in GMT Offset Notation

A key change in the time zone data which customers should understand before converting their applications to YellowBox / WebObjects 4.x is the change in the way that GMT offsets are denoted. The convention followed by the U.S. Government time zone data underlying Foundation in OpenStep 4.2 subtracted hours as one moved west of Greenwich and added hours as one moved east of Greenwich. Therefore, the offset five hours east of Greenwich was denoted as "GMT+5" or "GMT+0500" and the offset five hours west of Greenwich was denoted as "GMT-5" or "GMT-0500".

In the current time zone data received from the U.S. Government, the notation for GMT offsets has been changed to to the POSIX minutes-west-of-GMT convention, which adds hours west of Greenwich and subtracts hours east of Greenwich. This is OPPOSITE of the notation in OpenStep 4.2, so that the offset which used to be designated as "GMT-8" or "GMT-0800" is now designated "Etc/GMT+8".

The Foundation in WebObject 4.x can correctly map the old GMT offsets onto the new ones. However, if a customer is extracting the hour value from the offset and doing math calculations with it, they will need to take this into account or their software will return the opposite result from that obtained in OpenStep 4.2 / WebObjects 3.x.

Mapping of Old Time Zone Names to New Time Zone Names

A large number of named time zones have been added since the original release of OpenStep 4.2. Many reflect political changes in Europe and the former Soviet Union, but there are also many new named time zones for Pacific, Asian, Latin American, and African nations.

In addition, many previously-existing named time zones now have different names. For example, ALL of the named time zones in Canada, the U.S., and Australia have changed names. Here are some examples of the old and new time zone names from those countries:

OLD	**NEW**
Canada/Atlantic	America/Halifax
US/Eastern	America/New_York
US/Central	America/Chicago
Canada/Pacific	America/Vancouver
US/Pacific	America/Los_Angeles
US/Hawaii	Pacific/Honolulu
Australia/North	Australia/Darwin
Australia/Queensland	Australia/Brisbane

Many other time zones across the world have changed names as well. Foundation includes data tables and mechanisms to automatically convert old named time zones to new named time zones. In OpenStep 4.2 on UNIX, the OldTZNameToNewTZName.table located in Foundation.framework/Resources/TimeZoneInfo performed this mapping. In WebObjects 4, the mapping is done by an internal mechanism. The NSTimeZone class in YellowBox includes a class method, **+knownTimeZoneNames**, which returns a list of all the old and new time zone names which Foundation is able to recognize and process.

Microsoft Windows uses different time zone names than either old or new UNIX names. In order to provide consistent behavior across platforms, the Foundation framework translates Windows' time zone names to UNIX names, using the WindowsName.table in both OpenStep and YellowBox.

Time Zone Abbreviation to Time Zone Name Mapping

For each named time zone, several time zone abbreviations may be used to designate different local time types, that is, sets of rules for the

behavior of local time in that zone. For example, the America/Los_Angeles time zone (formerly called US/Pacific) has three local time types with associated abbreviations: PST, PDT, and PWT. A single named zone may contain a number of local time zones which reuse the same abbreviation. For example, the Pacific/Niue time zone covers three local time types which all use the abbreviation NUT. The Africa/Ceuta zone covers seven local time types, of which two use the abbreviation WET, two use WEST, two use CET, and one uses CEST.

Conversely, any number of different named time zones may reuse the same abbreviation. For instance, the abbreviation NST is used by the America/Adak, America/Goose_Bay, America/Nome, America/St_Johns, Pacific/Midway, and Pacific/Pago_Pago time zones. The abbreviation CET is used by 30 named time zones in the Atlantic, Europe, and Africa regions! As a result, there are very few time zones or time zone abbreviations for which the mapping from name to abbreviation is unambiguous. This ambiguity existed with the old time zone information but is much more pronounced with the greatly increased number of named time zones in the new data.

Foundation limits the ambiguity of mapping between time zone name and abbreviation for the NSTimeZone class by maintaining a dictionary which associates a single named time zone (the value) with a single abbreviation (the key). This file, Abbreviation.table, is located in the Foundation.framework/Resources/TimeZoneInfo directory. The list of abbreviations in the file is not comprehensive and the choice of time zone name associated with each is necessarily arbitrary. The NSTimeZone class in both WebObject 4 and OpenStep includes a class method, **+abbreviationDictionary**, which returns a dictionary containing the current association of time zone with abbreviation.

Changing the Time Zone Abbreviation to Time Zone Name Mapping

The Abbreviation.table file is a Unicode persistent property list. It may be edited by users, if needed, to achieve a different association of abbreviation with named time zone. Root permission is needed to edit this file. Anyone editing this file should be sure to use a Unicode-capable editor and save the edited file as Unicode. It is strongly recommended that a back-up copy of the original file be made before editing. Also, customers should keep in mind that if the abbreviation-to-named-zone mapping is changed on one machine and not on others which operate on the same data, inconsistent results will occur.

Foundation Time Zones versus Operating System Time Zones

All of the operating systems on which OpenStep and WebObjects ship include time zone information as part of the OS. The time zone information on different operating systems, and operating system versions, varies. In order to provide consistent behavior of applications across the various platforms, Foundation encapsulates the time zone data on which its time zone classes operate.

Thus, in many cases, the time zone names, time zone data, and/or GMT conventions in Foundation and applications utilizing the Foundation time zone classes is different from the time zone names, daylight saving data, and /or GMT conventions of the operating system. Customers should particularly keep this in mind if they have non-OpenStep/WebObjects applications which manipulate or store time zone information in a database or other persistent storage.

WebObjects 4: Using JDK 1.1.8 with WebObjects

This article explains how to use updated versions of Sun's JDK with WebObjects 4. This is an **unsupported configuration** and users should use these instructions at their own risk. Apple will not guarantee or provide support for this procedure.
This article has been archived and is no longer updated by Apple.
To install the JDK 1.1.8 and the JDK 1.2 Collection Classes on Solaris or Windows NT:

- Download JDK 1.1.8 and the JDK 1.2 Collection Classes from Sun's web site.
- Install the JDK (use the default location of /jdk1.1.8 on Windows NT, /usr/local/jdk1.1.8 on Solaris)
- Install the Collections (In this example, we will use /jdk1.1.8/collections on Windows NT, /usr/local/jdk1.1.8/collections on Solaris)
- Create the following environment variables:

JAVA_HOME	/usr/local/jdk1.1.8 (or c:/jdk1.1.8 for NT)
JDKDIR	$JAVA_HOME

- Edit $(NEXT_ROOT)/Library/Java/JavaConfig.plist to conform to the following:

```
Vendor = sun1.1.8
sun1.1.8 = {
VM = "$JDKDIR/bin/java.exe";
DefaultClasspath =  "$HOME/Library/Java; $NEXT_ROOT/Library/Java; $JDKDIR/lib/classes.zip;
$JDKDIR/collections/lib/collections.jar";
DefaultBeanpath =   "$HOME/Library/JavaBeans; $NEXT_ROOT/Local/Library/JavaBeans;
$NEXT_ROOT/Library/JavaBeans";
Compiler = "$JDKDIR/bin/javac.exe";
Headers = "$JDKDIR/include $JDKDIR/include/winnt";
Library = "$JDKDIR/lib/javai.lib";
DebugLibrary = "$JDKDIR/lib/javai_g.lib";
```

On Windows NT, this is all you need to do. On Solaris, you'll need to perform some extra steps:

- Change to the directory /opt/Apple/Library
- Rename the JDK directory to "JDK1.1.6"
- Recreate JDK as a link to the $JAVA_HOME directory:

```
ln -s $JAVA_HOME JDK
```

Be aware that the java compiler used by **make** is hardcoded to use JDK 1.1.6. This will not affect most Java projects.

WebObjects 4: Using OptimizeIt! With WebObjects

This article explains how to use the OptimizeIt! performance profiler with WebObjects 4 on Windows NT. This document assumes you are using OptimizeIt! 3.0 Professional Edition and WebObjects 4 on Windows NT 4.0.

OptimizeIt! is a product of Intuitive Systems, Inc. For more information or to download a demonstration version of OptimizeIt!, visit their web site at http://www.optimizeit.com.

This is an unsupported configuration. Apple will not guarantee or provide support for this procedure.

This article has been archived and is no longer updated by Apple.
Follow these steps to use OptimizeIt! with your WebObjects application on Windows NT:

1. Install OptimizeIt!

Follow the vendor's instructions to install OptimizeIt! Professional Edition. After installation, run the OptimizeIt.exe application. The Java setup wizard will prompt you for the location of your Java VM. The WebObjects Java VM is located in $NEXT_ROOT/Library/JDK.

2. Uncompress optit.jar

Find the optit.jar file and copy it to $NEXT_ROOT\\Library\\Java. By default, this file is installed into C:\\Program Files\\Intuitive Systems\\OptimizeIt30D\\lib. From a Bourne shell, manually uncompress this file with the command:

```
jar xf optit.jar
```

3. Add the OptimizeIt! .DLL's to your path

Find the two OptimizeIt! libraries, audit11.dll and audit12.dll. Edit your PATH environment variable to include the directory where these files are located, or copy these libraries into a directory which is in your PATH.

4. Modify Application.java

Because a WebObjects Java application handles its own startup of the Java VM, you will not be able to start up a WebObjects application from within OptimizeIt! as you would with a traditional applet. Instead, you will need to enable the OptimizeIt! audit system inside your WebObjects application and instruct OptimizeIt! to communicate with the application via a specified port.

In your WebObjects application, add the following statement to Application.java:

```
import intuitive.audit.*;
```

Also, add the following code to the constructor:

```
Audit.start(1470, Audit.WAIT_FOR_OPTIMIZEIT);
Audit.enableCPUProfiler();
Audit.enableMemoryProfiler();
```

5. Build and launch your application

Make clean and recompile your application. Before you compile, make sure the JIT compiler is disabled. If the JIT is not disabled, you can disable it by moving the JIT DLL (normally called SYMCJIT.DLL) into the directory:

/Apple/Library/JDK/bin

You are now ready to start using OptimizeIt! To begin profiling, first launch the WebObjects application. Because of the Audit.WAIT_FOR_OPTIMIZEIT start option which was added to the Application constructor, the application startup will stop at a statement similar to the following:

OptimizeIt! 3.0 audit system. (c) 1997-1999 Intuitive Systems Inc.
Port is 1470

Launch the OptimizeIt.exe application if you have not already. Since we are not starting an application process from OptimizeIt, there is no need to use the UI panel which comes up when the application is started. Do not enter any information into that panel.

NOTE: OptimizeIt! will not work if your WebObjects application is started inside GDB.

6. Attach your application

Choose "Attach" from the OptimizeIt! "Program" menu. In the "attach" panel, enter the host name of the machine on which your application is running and 1470 for the port number. Press the "Attach" button.

7. Collect profiling data

Once you have successfully attached to OptimizeIt!, you can start your application with the Program item of the Start menu. OptimizeIt! allows you to collect profiling information on the Java portions of your WebObjects application. Please see the OptimizeIt! documentation for more information on profiling your application.

WebObjects: How to determine the installed WebObjects version

This article has been archived and is no longer updated by Apple.

This article explains how to determine the version of WebObjects installed on a particular system.

Mac OS X Client 10.0 - 10.3, Mac OS X Server 10.0 - 10.2

Look in /Library/Receipts. You will see a list of .pkg files representing the installed software. If you see update packages, the name of the newest one tells you which release and update of WebObjects is installed. Examples:

```
WOxxxDeveloper.pkg ==> x.x.x Developer
WOxxxDeployment.pkg == > x.x.x Deployment
WOxxxMacOSX...UpdateN.pkg ==> x.x.x Update N
```

If you don't see any update packages, control-click (or right-click) on a WebObjects package (i.e. WODeveloper.pkg), choose 'Show Package Contents', and open the file Contents/Resources/software_version. Consult the 'WebObjects Build Names' table below to find your version.

Mac OS X Server 10.3

Note: Beginning with Mac OS X Server 10.3, WebObjects Deployment is included with the OS, and does not need to be installed separately.

1. Look in /Library/Receipts.
2. If you see ApplicationsServerUpdate.pkg, control-click (or right-click) it and choose 'Show Package Contents'.
3. Open Contents/Info.plist, and find the CFBundleShortVersionString key. A value of 1.0 indicates WebObjects Deployment 5.2.3.
4. If you do not see ApplicationsServerUpdate.pkg, look inside ApplicationsServer.pkg (control-click (or right-click) and choose 'Show Package Contents') and open Contents/Info.plist.
5. Find the CFBundleShortVersionString key.

```
CFBundleShortVersionString = 3.0 ==> WebObjects Deployment 5.2.4
CFBundleShortVersionString = 2.0 ==> WebObjects Deployment 5.2.3
CFBundleShortVersionString = 1.0 ==> WebObjects Deployment 5.2.2
```

Mac OS X Client 10.4 or later, Mac OS X Server 10.4 or later

Open /System/Library/Frameworks/JavaWebObjects.framework/Resources/version.plist. The value of the CFBundleShortVersionString key is the WebObjects version.

Windows

1. Click the 'Support Information' link in the WebObjects entry of the Add/Remove Programs control panel. This also shows any installed updates. If the control panel does not list WebObjects, a version prior to 5.0 may be installed.
2. While logged in as a user with Administrator privileges, look in the Start menu under WebObjects for 'About Apple Software' or 'About NeXT Software'.
3. Consult the 'WebObjects Build Names' table below to find your version.
4. Do not rely on product names shown in the panel, such as "WebObjects 3.5 Prerelease Developer"; use the table instead. For very old versions of WebObjects from NeXT, the Windows registry may be the most accurate source.
5. Under HKEY_LOCAL_MACHINE, look at SOFTWARE\\Apple or SOFTWARE\\NeXT\\WebObjects. You should see an entry for the major version of WebObjects, and another for any installed updates.

Solaris / HP-UX

1. Look in $NEXT_ROOT/Library/Receipts/PDO/software.ver or $NEXT_ROOT/NextLibrary/Receipts/WOF/software.ver for a build name, and consult the 'WebObjects Build Names' table below.
2. Do not rely on product names given, such as "WebObjects 3.5 Prerelease Developer"; use the table instead. WebObjects updates to versions 4.5 (4.5.0) and older did not update the software.ver file. See Knowledge Base article 70148 for instructions on determining which updates were installed.

OPENSTEP 4.2 for Mach

1. Look in /NextLibrary/Receipts. You will see a list of .pkg files representing the installed software.
2. To find the exact version, press command-shift-O to open the .pkg folder, and look at the software_version file inside.
3. Consult the 'WebObjects Build Names' table below to find your version. Do not rely on product names given, such as "WebObjects 3.5 Prerelease Developer"; use the table instead.

WebObjects Build Names

WebObjects Version	OS	Project Name	Build
5.2.4	Mac OS X	EU	7A31
5.2.4	Mac OS X Server	Tiger	8A428
5.2.4	Windows/Solaris	EU	7A31a
5.2.3	Mac OS X	EU	6A8
5.2.3	Mac OS X Server	SUPanFeldspar	7F46
5.2.3	Windows/Solaris	ErteW	6A7
5.2.2	Mac OS X	EU	5A21
5.2.2	Mac OS X Server	Panther	7B86
5.2.2	Windows/Solaris	ErteW	5A20
5.2.1	Mac OS X	ErteXUpdate	4A13
5.2.1	Windows/Solaris	ErteW	4A13
5.2	Mac OS X	ErteX	2E5
5.2	Windows/Solaris	ErteW	2E4
5.1.4	Mac OS X	Kahlo	1V5
5.1.3	Mac OS X	KahloX	3A2
5.1.3	Solaris	KahloW	3A2
5.1.3	Windows	KahloW	3A3
5.1.2	Mac OS X	KahloX	2A6
5.1.2	Windows/Solaris	KahloW	2A6
5.1.1	Mac OS X	KahloX	U5
5.1.1	Windows	KahloW	1U5
5.1.1	Solaris	KahloW	1U6
5.1	Mac OS X	KahloX	1R9
5.1	Windows/Solaris	KahloW	1R9
5 Update 3	Mac OS X Server	MonetX	3P4
5 Update 2	Mac OS X	MonetX	4A7
5 Update 2	Windows	Monet	4A8
5 Update 2	Solaris	Monet	4A12
5 Update 1	Mac OS X/Solaris	Monet	3R2
5 Update 1	Windows	Monet	3R4
5.0	(all)	Monet	3P4
4.5.1 Update 4	Mac OS X	Siren	4A4
4.5.1 Update 4	Windows/Solaris	Kali	4A4
4.5.1 Update 3	Mac OS X	Siren	3A7
4.5.1 Update 2	Mac OS X	Siren	2C3
4.5.1 Update 2	Windows/Solaris	Kali	2C3
4.5.1	(all)	Siren	1X5
4.5 Update 3	(all)	Dali	3V6
4.5 Update 2	(all)	Dali	3U4
4.5 Update 1	(all)	Dali	3S3
4.5	(all)	Dali	2S1
4.0.1 Patch 3	(all)	Picasso	3R
4.0.1 Patch 2	(all)	Picasso	3O
4.0.1	(all)	Picasso	2Z
4.0	(all)	Picasso	2N1
3.5.1 Patch 3	(all)	Bay	1C
3.5.1	(all)	Paris	1U2
3.1	(all)	GrannySmith	1R
3.0	(all)	Argonaut	4V
2.0	(all)	Argonaut	2V
1.0	(all)	Argonaut	1R

WebObjects 4: Developer License and Application Instance Number

This article discusses why a user might see the message:

```
"Attempt to access application in a way not permitted by licensing (more than one instance detected)"
```

when running a single instance of a WebObjects 4 application with a web server using the Developer license.

This article has been archived and is no longer updated by Apple.
Note: Any reference in this article to Mac OS X Server pertains to version 1.2, which was released prior to May 2001.

The WebObjects 4 Developer license permits the following:

- Platform: Windows NT and, with WebObjects 4.0.1, Mac OS X Server
- Single application instance
- Single Processor
- No multithreading
- No load balancing
- 25 transactions per minute on Windows NT
- 50 transactions per minute on Mac OS X Server

By default, WebObjects is set up to run in DirectConnect mode, but if you want to do some limited testing with an http server, you might encounter the following error:

```
"Attempt to access application in a way not permitted by licensing (more than one instance detected)."
```

To understand why that error message occurs, even if only a single instance of your application is running, take a look at your public WebObjects.conf file in $(NEXT_ROOT)/Library/WebObjects/Configuration. It probably lists an entry like:

```
MyApp:1@myhost 2001
```

where **MyApp** is the application name, **1** is the application instance number, **myhost** is the hostname, and **2001** is the WOPort. You probably also have a private WebObjects.conf file in the directory pointed to by the TEMP environment variable with an entry like:

```
MyApp:-1@myhost 2001
```

Since the Developer license allows only a single instance of your application to run at any given time, the WOResponse code checks for a hard-coded value for the application instance number. The hard-coded value it looks for is -1. If you change your public WebObjects.conf file to match the entry in the private WebObjects.conf file, i.e.:

```
MyApp:-1@myhost 2001
```

you should be able to run a single instance of your app with your Developer license without seeing this error message.

Normally you should not need to modify the WebObjects.conf file manually, as its primary function is for load balancing when using the Monitor application with a deployment license. For more information about the WebObjects.conf files (both public and private), please see **article 70040**, "WebObjects 4: Public and Private WebObjects.conf Files." Also see the "Serving WebObjects" documentation for more information about running a WebObjects application under Monitor.

Published Date: Feb 19, 2012

WebObjects 4: Finding Memory Leaks in Java Applications

There are two common types of memory leaks in WebObjects Java applications: leaks caused by the Java garbage collection scheme and leaks due to known problems with Java or the WebObjects Java components. This article discusses ways to prevent and analyze both types of memory leaks. This article assumes that you are using WebObjects 4.
This article has been archived and is no longer updated by Apple.

Leaks due to garbage collection

Often, the garbage collector has to run many times in order to completely find and free every unused object. The Sun garbage collector is not very aggressive; It often stops collecting even when there is more garbage left. Object references across the Java bridge can require many passes of the collector before they are cleaned up. Since the Java garbage collector cannot see references made by Objective C objects, they will appear as global, or non-collectable, references. Thus, several collections may be required to resolve some relationships; the Java garbage collector, then the Objective C garbage collector, then the Java garbage collector again, and so on. This results in memory temporarily leaking from the application.

For example, when Objective-C objects have their Java side garbage collected by the Java Garbage Collector thread, they themselves are not immediately dealloc'd. This happens only when the main thread crosses the Java bridge. When the Bridge frees up the global retain count it keeps on behalf of the Java VM for the Objective-C object, it may free up more Java/Objective-C objects. In order to reach a steady state over time, you will need to cause multiple runs of the garbage collector by forcing a loop of collection and autorelease. You can do this in WebObjects 4 by setting two different environment variables which tell the garbage collector to loop collection during session deallocation, **WOGarbageCollectionRepeatCount** and **WOWorkerThreadCount.**

WOGarbageCollectionRepeatCount is used to force garbage collection to occur a sufficient number of times so that most of the objects held by timed out sessions will be freed. A value of 3 for WOGarbageCollectionRepeatCount means that WebObjects assumes that you have object graphs that are (on average) about three references deep. This is also the default value in case no user default is specified. WOGarbageCollectionRepeatCount == 0 means that the garbage collector isn't run upon session deallocation.

WOWorkerThreadCount specifies the maximum number of worker threads for a multithreaded application. The default value for WOWorkerThreadCount is 8. Setting this count to 0 results in a single threaded request dispatch, similar to WebObjects 3.5.1. Please note that if WOWorkerThreadCount value == 0, then WOGarbageCollectionRepeatCount will no longer have any effect.

In Project Builder, bring up the Launch Panel and add the following launch arguments:

```
-WOWorkerThreadCount 8  -WOGarbageCollectionRepeatCount 6
```

WOWorkerThreadCount can have any value greater than zero, and WOGarbageCollectionRepeatCount can have any value between 3 and 8. You can also specify these two variables when starting your application from the command line. Please note that running the Garbage Collector repeatedly may affect the performance of your application.

Leaks due to known Java memory problems

Static or global references

Leaks can occur if your application keeps an array of allocated sessions, or some kind of global notification registry. Since Java (in JDK 1.1) does not support weak references, any object placed in that array, and all objects referenced by that array, will never be collected. Even in JDK 1.2, using weak references correctly to avoid this problem is still problematic.

Retain cycles across the Java bridge

One potential source of leaks is when your application creates a reference cycle across the bridge. For example, WOApplication has an Objective C retain on its WOSessions. If a Java subclass of WOSession then adds an instance variable to point at WOApp, you have created a cycle across the bridge and your session will never be collected.

This problem is documented in the WebObjects 4 release notes as follows:

Apple Reference # 2282368

Problem: Java Inner classes can create retain cycles resulting in leaked sessions and pages.

Description: If you are using inner classes in your session and/or pages, be aware that non-static inner classes have a hidden pointer to their owning class. This make it easy to get into situation where a mixed objC-Java retain cycle is created, preventing the deallocation of all objects on that cycle. For example, if you pass an instance of an inner class of a page to one of its subcomponents, you get the following cycle:

```
yourSubcomponent > theInnerClassInstance > (through the hidden ivar)  theTopLevelPage > (through normal objC containment) > yourSubComponent
```

Workaround: One possible way to break the cycle is to use a *static* inner class, which does not have this hidden instance variable.

EOF 2.2 User Patch 3 Overview

This document contains release notes for EOF 2.2 User Patch 3, an update to Apple's Enterprise Objects Framework on Windows NT. This patch incorporates all EOF bug fixes released in EOF 2.2 Patch 1 and 2, the WebObjects 3.5.1 Database Adaptor Patches and the WebObjects Java Patch 2. This patch should **only** be applied to systems with EOF 2.2 installed. This patch only addresses user-level issues. EOF 2.2 developers should also see **article 70057** for more information on EOF 2.2 Developer Patch 2.

The WebObjects Current Patch List, **article 70037**, contains information on all available patches and workarounds for all versions of WebObjects, including EOF patches. The OPENSTEP Current Patch List, **article 70033**, contains information on all available patches and workarounds for all versions of OPENSTEP, including EOF patches. Please read these documents if you're not sure which patches you need on your system.
This article has been archived and is no longer updated by Apple.
Installing EOF 2.2 User Patch 3 on Windows NT 4.0

1. Download the Windows NT version of the patch from Apple's FTP site at ftp.info.apple.com. Also **download** the installer script, "patcher.nt.sh".

2. Log in as a user with Administrator privileges.

3. Open a Bourne shell. The Bourne shell should be available from your Start menu, under the WebObjects program group, or under your Apple root directory at NextLibrary\\Executables\\sh.exe.

4. Change to the directory containing the patch and the patch installer, "patcher.nt.sh".

5. Type the following at the shell prompt (make sure that there are no EOF applications running first):

```
./patcher.nt.sh -install EOF22_NT_User_Patch3.TAR.gz
```

For more information on using the patcher.nt.sh program, type the following at the command prompt:

```
./patcher.nt.sh -help
```

6. Reboot your Windows NT system

Issues Fixed

Corrected in EOF 2.2 User Patch 3

Editing context should not decrement snapshot retain count when forgetting a fault
Apple reference # 2326799

ISSUE:
When an editing context was released, the snapshot retain count was decremented for all of its registered objects, both "real" objects and faults. Since the snapshot retain count is only incremented when "real" objects are registered, this caused the snapshot retain count to be too low for faulted objects. An exception might be raised later because the snapshot had been released prematurely. This problem was listed as corrected in the release notes for EOF 2.2 User Patch 2, but the fix was not actually included in that patch.

RESOLUTION:
EOEditingContext now decrements the snapshot retain count only for complete objects, not for faults.

Corrected in EOF 2.2 User Patch 2

EOF applications crash accessing SQL Server 7
Apple reference # 2315234

ISSUE:
EOModeler and other EOF-based applications crashed when trying to connect to Microsoft SQL Server 7.0.

RESOLUTION:
The EOF ODBC adaptor has been updated, enabling EOF applications to connect to SQL Server 7 without error.

Java project recompilation
Apple reference # 2315243

ISSUE:
In order to take advantage of a bug fix in an upcoming WebObjects patch, some EOF Java projects needed to be recompiled.

RESOLUTION:
The relevant projects have been recompiled in this patch.

ODBC adaptor generates spurious login error message
Apple reference # 2315563

ISSUE:
While defining a new model or switching a model's adaptor to ODBC, the first attempt to connect to the database failed and a misleading "invalid login" error message was displayed. However, if the user continued with the login, entering the correct user name and password, the login succeeded. Subsequent attempts to log in with the same model did not produce this false error message.

RESOLUTION:
The connection information associated with the initial login panel is now properly constructed.

ODBC adaptor prepends owner to table name
Apple reference # 2319114

ISSUE:
When reverse engineering a Microsoft SQL Server database with ODBC, the table names all had the form OWNER.NAME instead of just NAME.

RESOLUTION:
The table names no longer have the owner prefixed to the name.

Snapshot refcount not incremented correctly with Entity Caching turned on.
Apple reference #2327400

ISSUE:
With entity caching enabled, the snapshot retain count was not correctly incremented when an entity was cached. Since the retain count was too low, a crash could result when attempting to access a cached entity whose snapshot had been released too soon.

RESOLUTION:
The EOAccess framework now increments the snapshot retain count for each object in an entity when the entity is cached and decrements the snapshot retain count for each object when the cache is invalidated.

Corrected in EOF 2.2 Patch 1

OracleEOAdaptor generates incorrect SQL for left and right outer joins
Apple reference # 2165674, 2288089

ISSUE:
The SQL generated by the Oracle adaptor for a left outer join was actually the syntax for a right outer join, and vice versa.

RESOLUTION:
The Oracle adaptor now generates the correct SQL for left and right outer joins.

EODatabase never releases snapshots
Apple reference # 2169671, 2231693

ISSUE:
Snapshots associated with enterprise objects were never released.

RESOLUTION:
EOF now tracks references to an object and releases the object's snapshot when there are no more references to it

Newly inserted objects not deleted correctly
Apple reference # 2176466, 2253191

ISSUE:
An object created and inserted into an editing context or relationship, then deleted before being saved to the database, was not completely removed from the editing context. This caused an exception to be raised the next time the editing context was saved.

RESOLUTION:
Deletion of a newly-inserted object now completely removes the object from the editing context.

Optimistic locking fails on rows with trailing spaces
Apple reference # 2177721, 2231704

ISSUE:
OracleEOAdaptor stripped trailing spaces from VARCHAR2 data fetched from or committed to an Oracle database. If VARCHAR2 data containing trailing spaces had been inserted by another tool, optimistic locking failed for any affected row and the row could not be updated.

RESOLUTION:
OracleEOAdaptor no longer strips trailing spaces from VARCHAR2 data.

Incorrect NSNumber formatting for zero values
Apple reference # 2181645, 2264031

ISSUE:
Zero values for number fields displayed by EOF did not always have appropriate formats for their types. For example, some integer zero values were represented as "0.00".

RESOLUTION:
EOEntity has been modified to format zero values appropriately for all number types.

Logic error in EOAccess layer sometimes raises exception while generating primary keys
Apple reference # 2182084, 2278561

ISSUE:
Under certain circumstances, the EOAccess code that generates primary keys sent a message to inappropriate objects causing a "NoSuchMethodError" exception to be thrown in Java or one of several exceptions to be raised in Objective C.

RESOLUTION:
EOAccess now checks the class of the receiver before sending the message that was causing the issue.

EOModeler can't create a model with EODeleteRuleNoAction
Apple reference # 2202107, 2248443

ISSUE:
In EOModeler's AdvancedRelationship inspector, if the Delete Rule was set to "No Action", the following warning was posted the next time the model was opened:

```
Invalid delete rule string:'EODeleteRunNoAction' on entity with name: '<entity_name>'
```

This issue could also affect applications which create their own models.

RESOLUTION:
This issue was caused by a simple typographical error which has been corrected. It is now possible to create models with EODeleteRuleNoAction.

EOQualifier qualifierWithFormat methods conflict
Apple reference # 2203613, 2275802

ISSUE:
If a qualifier was created using **+[EOQualifier qualifierWithQualifierFormat: arguments:]** and, subsequently, another qualifier was created using **+[EOQualifier qualifierWithQualifierFormat:]**, a parse error occurred, even if the second qualifier was valid.

RESOLUTION:
The interference between these two methods has been removed and they now operate correctly.

selectObject: method return values don't match documentation
Apple reference # 2205357, 2275804

ISSUE:
The **[EODisplayGroup selectObject:]** method would only returned 'NO' if it could not end editing or if the delegate refused the change. According to the class documentation, it should also return 'NO' if the EODisplayGroup's displayedObjects array does not contain a match with the method's object argument.

RESOLUTION:
As stated in the documentation, this method now also returns 'NO' when it cannot find a match for the argument object.

Sybase can't fetch float and text data together
Apple reference # 2208497, 2259088, 2274601

ISSUE:
The Sybase adaptor could not fetch data of types text and float together.

RESOLUTION:
The adaptor has been fixed so that there is no longer a conflict between these data types.

EOControl layer raises exception while building qualifier
Apple reference # 2213188, 2271206

ISSUE:
The qualifier parsing code in the EOControl layer incorrectly sends **copyWithZone:** to custom enterprise objects under certain conditions, causing a "selector not implemented" exception to be raised in Objective C or a "CloneNotSupportedException" to be thrown in Java.

RESOLUTION:
copyWithZone: is no longer called on custom enterprise objects when building a qualifier.

Nil value in EOAttribute causes crash while saving EOModel
Apple reference # 2220588, 2274226

ISSUE:
In certain circumstances, a crash occurred during the save of an eomodel because a nil serverTimeZone attribute was being inserted into the eomodel.

RESOLUTION:
The EOAccess layer has been changed to test for and handle a nil value for this attribute.

Exception while writing an eomodel to disk corrupts the model
Apple reference # 2220893, 2274225

ISSUE:
If an exception was raised while an eomodel was being written to disk, the original model was lost and only the partially-written or corrupted model was left on the disk.

RESOLUTION:
A backup copy of the eomodel is now made before the write begins. If an error occurs during the write the partially-written file is saved as <model_name>.eomodeld# and the original eomodel is restored from the backup.

Prefetching can mysteriously fail
Apple reference # 2223730, 2264033

ISSUE:
Prefetching would sometimes failed for no apparent reason, due to inappropriate filtering of relationships inside the EOAccess layer.

RESOLUTION:
The incorrect filtering on prefetches has been removed from EOEntity.

Unnecessary firing of to-many faults
Apple reference # 2227660, 2248080

ISSUE:
If the PropagatePrimaryKey flag on an EOEntity was set to YES, saving changes to the EOEditingContext caused array faults for all of that entity's to-many relationships to be fired. This was not necessary and could cause performance issues.

RESOLUTION:
The EOAccess layer has been changed so that it no longer fires unnecessary faults.

EOFault retain/release behavior conflicts with Java bridge
Apple reference # 2239504, 2297785

ISSUE:
EOFault's special handling of retain and release sometimes caused conflicts with the Java bridge.

RESOLUTION:
The retain and release behaviors of EOFault have been modified to interoperate correctly with Java via the bridge.

Incorrect Sybase smallint mapping
Apple reference # 2241377, 2247522

ISSUE:
On HP-UX and Solaris, data with the Sybase type **smallint** was mapped to **NSNumber/Integer** and assigned the original value times 2 ^16 when retrieved from a Sybase database.

RESOLUTION:
The Sybase adaptor now correctly maps smallint data to type NSNumber/Short and does not modify the value.

No EOActionCellAssociation for most controls
Apple reference # 2243956, 2269874

ISSUE:
EOActionCellAssociation did not work with controls other than NSTextField in EOF 2.2 and WebObjects 3.5.1.

RESOLUTION:
This class has been changed to work with NSButtons and other controls, as well as NSTextFields.

Can't use Sybase 11 stored procedures
Apple reference # 2244533, 2274650

ISSUE:
The Sybase adaptor was unable to interpret stored procedures created in Sybase 11.

RESOLUTION:
The adaptor has been fixed to work properly with stored procedures from both Sybase 10 and Sybase 11.

Case-insensitive matching sometimes fails
Apple reference # 2248977, 2275805

ISSUE:
Case-insensitive matching in EOQualifier did not correctly match uppercase letters in the search pattern with lowercase letters in the receiving string.

RESOLUTION:
EOQualifier has been fixed. **[EOQualifier isCaseInsensitiveLike:]** now works correctly.

EOEntity methods raise exceptions
Apple reference # 2251180, 2256685

ISSUE:
Under some circumstances some methods of EOEntity, including setAttributes, setClassProperties, setRelationship, and removeRelationship, did not clear a private variable, potentially resulting in an application exception.

RESOLUTION:
These methods now handle their private instance variables correctly.

Oracle adaptor state not reset when closing the database channel fails
Apple reference # 2252175

ISSUE:
If the Oracle adaptor encountered an error while closing the database channel, the adaptor state was not reset correctly. As a result, the database connection could not be re-established on that channel once the database came back up.

RESOLUTION:
The Oracle adaptor now sets its internal state correctly before raising the error, allowing the connection to be re-established once the database is restored.

Multiple propagation primary keys create race condition
Apple reference # 2260541, 2267964

ISSUE:
Saving changes to two databases when both had a propagation primary key would not work in previous versions of EOF. A race condition occurred and only one database was able to generate primary keys.

RESOLUTION:
EODatabaseContext has been changed to correct this behavior. Both databases can now generate their primary keys correctly.

Special characters crash Sybase adaptor
Apple reference # 2260785, 2261262

ISSUE:
The SybaseEOAdaptor crashed when saving Text or BLOB data containing characters which could not be successfully encoded using the specified database encoding.

RESOLUTION:
The adaptor has been fixed to detect the encoding failure and raise an exception, so that a database encoding which is able to handle the issue characters may be specified in the connection dictionary.

Can't use smallints as arguments to Sybase stored procedures
Apple reference # 2262888, 2274608

ISSUE:
The Sybase adaptor did not allow the use of smallints as arguments to stored procedures.

RESOLUTION:
The Sybase adaptor now allows stored procedures with smallint arguments.

Java garbage collecting fails with EOEditingContext
Apple reference # 2264063, 2264251, 2270489

ISSUE:
EOEditingContext did not retain its registered objects. This could cause issues with Java garbage collection.

RESOLUTION:
EOEditingContext now allows users to specify whether editing contexts retain their objects or not with the new class methods **setInstancesRetainRegisteredObjects:flag:**, **getInstancesRetainRegisteredObjects**, and **reset**. For API details, please see EOEditingContext.h. By default, in applications which contain Java, the editing context does retain all registered objects.

Deallocating an EODatabase containing snapshots causes crash
Apple reference # 2265751, 2272549

ISSUE:
EODatabase released its snapshots too early during deallocation, causing a fatal exception to be raised if any snapshots were present.

RESOLUTION:
The order in which instance variables are released by EODatabase has been corrected.

Memory leak in EODisplayGroup
Apple reference # 2217263, 2256402

ISSUE:
A private variable was not being released in EODisplayGroup, causing a memory leak.

RESOLUTION:
This variable is now released correctly.

Informix adaptor crashes on failed referential integrity check
Apple reference # 2272207, 2274351

ISSUE
If the InformixEOAdaptor was unable to find matching source and destination entities of a referential integrity constraint, it passed a nil pointer to the database, causing a crash.

RESOLUTION
The InformixEOAdaptor now detects this condition and handles it appropriately.

Incorrect time zone conversions in the SybaseEOAdaptor
Apple reference # 2276899, 2276907

ISSUE:
When converting a time value to the server time zone, the SybaseEOAdaptor only substituted the server's time zone without actually adjusting the time value for the zone difference.

RESOLUTION:
SybaseEOAdaptor now performs the conversion of the time value to the corresponding value in the server's time zone.

Can't subclass entities with fetch specifications
Apple reference # 2278492, 2279849

ISSUE:
Due to an error in EOKeyValue encoding, EOModeler was unable to create a subclass when a fetch specification was associated with the entity being subclassed.

RESOLUTION:
The encoding is now correct and entities with associated fetch specifications can be subclassed from within EOModeler.

Deleting objects with "toManyToOne" relationships sometimes fails.
Apple reference # 2278795, 2287021

ISSUE:
In some circumstances, EOF did not correctly handle deletion of an object with a toManyToOne relationship, leaving rows in intermediate tables which should have been deleted.

RESOLUTION:
The EOAccess layer now does a more thorough analysis of an object's relationships when it is deleted, and data in intermediate tables is correctly removed.

BusinessLogic framework fails to retain some global IDs
Apple reference # 2290233, 2290236

ISSUE:
Several classes in the BusinessLogic framework example failed to retain global IDs for some enterprise objects, resulting in messages being sent to unexpectedly freed objects.

RESOLUTION:
The classes now retain global IDs appropriately.

Editing the owning relationship in a nested editing context more than once corrupts the database snapshots.
Apple reference # 2280979, 2287025

ISSUE:
Due to an error in the processing of array faults by the database context, editing the owning relationship in a nested editing context more than once corrupted the database snapshot for the owning object, resulting in database corruption.

RESOLUTION:
The error in EODatabaseContext has been corrected.

EODisplayGroup instances leak
Apple reference #2286314

ISSUE:
Each EODisplayGroup instance leaked two EOObserverProxy objects.

RESOLUTION:
This leak in EODisplayGroup has been fixed.

Incorrect time zone conversion in EOAccess layer.
Apple reference #2287379

ISSUE:
When converting a time value to the server time zone, the EOAccess layer substituted the server's time zone without actually adjusting the time value for the zone difference.

RESOLUTION:
EOAttribute now performs the conversion of the time value to the corresponding value in the server's time zone.

Corrected in EOF 2.2 Sybase Adaptor Patch

All parameters required for Sybase stored procedures
Apple reference # 2203081

ISSUE:
If you did not supply all values when executing a Sybase stored procedure, the execution would fail with an exception like:

```
Feb 19 11:23:53 WOF_3_5_Sybase_Patch[1027] Caught exception:EOGeneralAdaptorException

Sybase: Server:unknown Procedure:NEXT_MOVIE_PRIMARY_KEY Line:0 Procedure NEXT_MOVIE_PRIMARY_KEY expects
parameter @A_MOVIE_ID, which was not supplied.
```

This happens even though A_MOVIE_ID is not required for the stored procedure.

RESOLUTION:
The Sybase adaptor no longer requires optional arguments to stored procedures.

Corrected in EOF 2.2 ODBC Adaptor Patch

ODBC Adaptor cannot execute stored procedures with output parameters
Apple reference # 2208503

ISSUE
The EOF 2.2 (WebObjects 3.5) version of ODBCEOAdaptor.framework introduced a bug which causes an error when using a stored procedure with an output parameter.

RESOLUTION
The ODBC adaptor now handles output parameters correctly.

ODBC adaptor leaks connections with Microsoft Access
Apple reference # 2209574

ISSUE:
The EOF 2.2 (WOF 3.5) and earlier versions of ODBCEOAdaptor.framework did not release ODBC connections when using Microsoft Access (or any JET based data source) in order to work around a bug in the Microsoft odbcjt32.dll library; this bug caused a crash when SQLFreeConnect was called. The SQLFreeConnect bug was discovered in version 3.40.2829 of the DLL. Newer versions of the DLL (beyond 3.50) no longer exhibit the crashing issue.

RESOLUTION:
The patched version of this framework now checks the version of the DLL more carefully and allows SQLFreeConnect to be called unless the DLL version is 3.4X. The adaptor no longer leaks the ODBC Connection when running with fixed versions of odbcjt32.dll.

WebObjects 4: Using JavaClient with Internet Explorer under Mac OS 8.6

Q: I'm using JavaClient in my WebObjects application, but Internet Explorer version 4 on Mac OS 8.6 won't run my JavaClient components. How can I configure Mac OS 8.6 and IE to run my application correctly?
This article has been archived and is no longer updated by Apple.
A: To use JavaClient on Mac OS 8.6, you will need to install the correct versions of MRJ and the Swing libraries. You need MRJ version 2.1.2 or later and Swing version 1.0.3 or later. You should be able to find links to both from Apple's web site at:

http://www.apple.com/java

Next, open the Preferences panel in Internet Explorer (under the Edit menu) and select "Java" to bring up the Java preference panel. Select the new MRJ version as your Java virtual machine and add the swingall.jar file to your classpath. WebObjects Java client applications should now work correctly.

WebObjects 3.5.1 Patch 4 Overview

This document contains an overview and download information for Apple's Patch 4 for WebObjects 3.5.1.

This article has been archived and is no longer updated by Apple.

Introduction

This document describes Apple's Patch 4 for WebObjects 3.5.1. This patch set includes fixes that address the Year 2000 compliance issue (century rollover). Users of WebObjects 3.5.1 should install this patch set. Detailed release notes, including specific problems fixed with Apple bug tracking numbers, are included in the download package. Please read these release notes for important information on what is and is not covered by this patch. These Release Notes also document the issues found in Enterprise Objects Framework (EOF).

WebObjects 3.5.1 Patch 4 supercedes all previous WebObjects 3.5.1 general system patches. If you have already installed a WebObjects patch on your system, you can install Patch 4 over your existing installation. If you have not installed any previous patches, you do not need to.

For additional Year 2000 tips for WebObjects developers, see article 70048: "**WebObjects Year 2000 Technical Tips.**"

WebObjects 3.1 users should see article 70099**:** "**WebObjects 3.1 Patch 1 Overview**" for information on the equivalent patch for WebObjects 3.1.

The WebObjects Current Patch List (see article 70037: "**WebObjects Current Patch List**"), contains information on all available patches and workarounds for all versions of WebObjects, including EOF patches. Please read this document if you're not sure which patches you need on your system.

How To Use

This patch consists of patch binaries for **Solaris**, **Windows NT**, and **HP-UX** platforms. The **release notes** included with the patch contain descriptions of additional steps required for full compliance on developer installations for all platforms. A separate **patch installation script** is also required for Solaris and HP-UX users.

This patch affects the development and deployment versions of WebObjects 3.5.1 on Windows NT, Solaris, and HP-UX. No WebObjects patch is required for users of WebObjects 3.5.1 on OPENSTEP 4.2 for Mach; however, you must have OPENSTEP 4.2 for Mach Patch 4 or later installed on your OPENSTEP system. WebObjects users on OPENSTEP for Mach should also read sections 3 and 4 of the **patch release notes**; these sections describe some manual steps you should take to avoid some Year 2000-related problems.

Apple has tested WebObjects 3.5.1 with Patch 1 installed and has determined based on the results that the software meets Apple's standard of Year 2000 compliance. For Apple, Year 2000 compliance means that the software does not produce errors processing date data in connection with the year change from December 31, 1999 to January 1, 2000, when using accurate date data in accordance with its documentation, provided all other products used with it properly exchange date data with the Enterprise Software product.. This includes the use of the database adapters included with EOF, when used through EOF. It has been determined that the direct use of client library API, custom SQL statements, or other use of the database adapters or software other than through the EOF APIs may produce results that do not meet Apple's standard of Year 2000 compliance.

What Is Not Covered

Third Party Software Applications

WebObjects 3.5.1 is designed to support certain third-party products, including but not limited to databases, web servers and HTML editors. Apple has not tested the Year 2000 status of these products and will not guarantee or provide support for them.

Operating System Software

WebObjects 3.5.1 can be used under OPENSTEP for Mach, Windows NT, Solaris, and HP-UX. Because WebObjects depends on the underlying operating system for some time and date information, Apple cannot guarantee the operation of WebObjects after December 31, 1999 unless the underlying operating system is free of Year 2000 problems. Please contact your operating system vendor regarding the Year 2000 status of your system. WebObjects installations running on OPENSTEP 4.2 for Mach systems must have OPENSTEP 4.2 for Mach Patch 4 or a later patch version installed on their system for Year 2000 compliance.

WebObjects 4: Using SSL with WebObjects 4

Secure Sockets Layer (SSL) is the Internet security protocol for point-to-point connections. It provides protection against eavesdropping, tampering, and forgery. Clients and servers are able to authenticate each other and to establish a secure link, or "pipe," across the Internet or Intranets to protect the information transmitted. (Source: RSA Security Protocols Overview, http://www.rsa.com/standards/protocols/ssl_tls.html.) This article discusses how to implement SSL with WebObjects 4.

An example using the techniques discussed in this article is available in **Article 70106**

This article has been archived and is no longer updated by Apple.

Establishing an SSL Connection

Traditional, non-secure connections are made with the HTTP protocol, using a URL such as "http://www.webobjects.com." A web browser will attempt an HTTP connection with the server on port 80 unless another port is specified. By changing the "http://" to "https://", e.g. "https://www.webobjects.com", the web browser will attempt to connect to the server via SSL. This connection defaults to port 443.

Setting up a secure server is beyond the scope of this article. For assistance, contact one of the Certificate Authorities such as VeriSign (at www.verisign.com), RSA (at www.rsa.com), Entrust (at www.entrust.com), or Thawte (at www.thawte.com).

Why Doesn't WebObjects Support SSL?

Actually, it does! An entire WebObjects application can be run in SSL mode by starting it with an "https:" URL. However, encrypting and decrypting every page uses system resources. Also, there's no way to switch between HTTP and SSL. This is because WebObjects generates URL's relative to the server root, omitting the protocol prefix. For example, a typical URL generated by WebObjects starts with "/cgi-bin/WebObjects/..." instead of a complete URL like "http://www.webobjects.com/cgi-bin/WebObjects/...".

Why does WebObjects generate these abbreviated URL's? Once the initial URL is given with the protocol, host name, and (optional) port number, these don't need to be re-specified for every connection. The same protocol, host name, and port numbers are used for subsequent connections. Omitting them saves on system overhead, and in most cases they're not needed anyway.

Adding SSL Support to WebObjects

To switch to SSL mode, your app must generating a URL beginning with "https://". To switch back, it must generate a URL beginning with "http://". Both of these tasks require that WebObjects generate complete URL's, instead of URL's relative to the server's document root (/cgi-bin/WebObjects/...). There is a private method in WOContext which allows this, called _generateCompleteURLs. Calling this method during the request-response loop ensures that all subsequently-generated URL's in the response have URL's beginning with "http://", followed by the host name and (optional) port number.

The _generateCompleteURLs method prefixes URL's with the value of the WOCGIAdaptorURL variable. This value can be set from the command line when launching the application (with the -WOCGIAdaptorURL flag), through user defaults, programatically via WOApplication methods, or via Monitor. WOCGIAdaptorURL defaults to "http://localhost/cgi-bin/WebObjects". Despite its name, WOCGIAdaptorURL is also used by the NSAPI and IIS adaptors. The user default WOAdaptorURL may also be used for compatibility, although this is not recognized as a command-line option.

Now that we can generate complete URL's, and specify the prefix, all that's required to generate a URL pointing to a secure server is to get the value of WOCGIAdaptorURL, change the "http" prefix to "https", and call _generateCompleteURLs. For example:

```
url = [[WOApplication cgiAdaptorURL] mutableCopy];
range = [url rangeOfString:@"http://"];
if (range.length > 0) {
[url replaceCharactersInRange:range withString:@"https://"];
[WOApplication setCGIAdaptorURL:url];
}
[context _generateCompleteURLs];
```

This code is from the enableSSLInContext method of the SSL class, available for download as part of the WebObjects 4 SSL Example, **Article 70106**. Executing this code anytime during the request-response loop will cause all subsequently-generated URL's to link to the secure server; the disableSSLInContext method switches back to "http://". These methods are written in Objective C, but are "wrapped" for use in Java.

Mixing Normal and Secure URL's

A major limitation of the above code is that it changes the protocol for an entire page. To mix normal and secure URL's on a page, you must know exactly where in the request-response loop to change the protocol, and where to change it back.

A new dynamic element, SSLContainer, has been provided in the SSL Example. This element can be "wrapped" around any block of HTML, and any URL's generated by WebObjects inside the SSLContainer will have an "https://" prefix. The element does not take any bindings. For example,

consider the following HTML:

```
<webobject name=GiftIdeas>
</webobject>
<webobject name=ContinueShopping>
</webobject>
<webobject name=SecureArea>
 <webobject name=Checkout>
 </webobject>
</webobject>
```

And the following wod:

```
GiftIdeas: CatalogPage { ... }
ContinueShopping: WOActiveImage { ... }
SecureArea: SSLContainer { }
Checkout: WOActiveImage { ... }
```

All of the URL's on the page will start with"http://", except for the link to the checkout page, which will start with "https://". Since it works similarly to the WOComponentContent dynamic element, SSLContainer can include any number of nested components.

Known Problems

- The method _generateCompleteURLs and the class WOHTMLStaticGroup are private, and their use is not supported by Apple. They are subject to change or removal in future WebObjects releases. The example code distributed with this article was developed using WebObjects 4.
- The WOQuickTime dynamic element uses its own algorithm for assembling complete URL's, instead of calling _generateCompleteURLs. As a result, QuickTime movies should not be placed on a secure server. (If this is required, use an HTML hyperlink instead.)
- This method will not work if the value for WOCGIAdaptorURL includes a port number. This would be required if the non-secure web server was running on a port other than 80. The enableSSLInContext method simply replaces "http" with "https", but does not rewrite port numbers, so the browser would attempt an SSL connection to the HTTP port and fail. Of course, it is still possible to run your application on a port other than 80. Just be sure to omit the port number from WOCGIAdaptorURL (i.e. instead of "http://www.webobjects.com:5000/cgi-bin/WebObjects", use "http://www.webobjects.com/cgi-bin/WebObjects"). You will not be able to auto-launch your application from Project Builder with this setup, so set WOAutoOpenInBrowser to NO.

WebObjects 4: Performance Tips

Aggressive schedules and the quick pace of web time don't always leave developers with much time for performance optimization. This article is a collection of practical tips on speeding up your WebObjects application after most of your code has been written. This performance tuning information has been gathered while assisting our developers in support, and from in-house projects and testing. This article concentrates on the I/O processing between your application and the database; we'll also tell you about some of the features of WebObjects 4 that you might have missed.
This article has been archived and is no longer updated by Apple.

Measure your application

In a WebObjects application, there are four basic sources of response time delays. Ordered with the most expensive first, they are:

- I/O & processing between your application and the database
- WOF request/response handling
- Custom application action handling
- I/O between browser, web server, and Application

Of course, the source of performance delays in deployed application will vary from project to project. This article focuses on database I/O; however, before you spend a lot of time fine-tuning your app, we recommend measuring your application to see where your bottlenecks are. You may find problems where you least expect them; sometimes adding hardware is the best solution to a performance problem.

How much speed do you need?

You can get a rough estimate of your application's ability to generate pages by running one instance and observing the response time of your pages. Run through what you think is a typical session, using the WOStats page to tell you the relative speed of each page in your application. Run through several sessions and subtract out the times for the first hit on any page to allow for the one-time overhead in HMTL/wod parsing. Inverting the resulting average response time will give you a pages per second measurement. For an app that is CPU limited, this figure can serve as an estimate of the total page throughput that your app can deliver. If it is greater than the expected load for your app by an order of magnitude or more, you probably don't need to worry about further performance tweaks.

For a more reliable performance estimate, WebObjects 4 provides the WOPlaybackManager. This lets you create a few typical scenarios and let them run simultaneously against your server. You can start them all up to warm up the application, then reset your WOStats and let them run for a few minutes. For more information on WOPlaybackManager, please see the WebObjects documentation.

Add timing code

In addition to WOStats, consider adding timing code to your Application object to establish timing for the different phases in the request/response loop. The timing for the methods takeValues and appendToResponse relates to WebObjects, while the timing for invokeAction measures your code. This is usually where fetching happens. If invokeAction is taking a long time, the first place to look is at your For an example of timing the request/response loop, use the WOAssociationTiming framework; for details, see **article 70105**.

Optimize your fetches

To test the performance of your fetches, run your application with EOAdaptorDebugEnabled set to YES. This will give you an idea of how much SQL you are sending on a given page. Keep in mind that the Object Uniquing feature in EOF means that previously fetched data won't get fetched again when navigating the same relationships. For each page, look at the SQL generated by each hit after the warmup phase.

Pay special attention to any SQL that looks like a fault firing. Faults are a convenient feature in EOF, but incrementally firing several of them can slow down your app significantly. If you can identify that some of the faults are being fired for most requests, try prefetching them instead. If the usage pattern is not clear, the "batch faulting" feature might be a better choice. Both prefetching and batch faulting are documented in the Enterprise Objects Framework Developer's Guide.

Looking at the SQL should also help you determine if performance problems occur during fetching or during saving. Web apps tend to do mostly fetching, but if you are regularly saving data, this could also cause a performance hit.

Set a fetch limit

With the EOFetchSpecification API, fetch limits can be set on an application-wide basis or for each fetch.

Use one global editing context or share display groups

Using a global editing context, instead of the default of one editing context per session, will reduce the session size and speed up your app if you need to archive sessions. Having one shared editing context will also speed up the retrieval of read-only data.

Here is one way to implement a globally shared editing context in Objective C. Put this code in your Application.m file. If the shared global editing context does not exist, this method creates a new one. At the same time, a global fetch limit is set to 20. Please note that the "fetchLimit" here can be stored as a user default and can be changed in a convenient way. When a session needs to refer to the editing context, it can do the following:

```
ec = [(Application *) WOApp sharedGlobalEditingContext];
```

Remember to send a release message to your ivar _sharedGlobalEditingContext in Application's dealloc method to avoid leaks.

```
int globalFetchLimit;
- (EOEditingContext*)sharedGlobalEditingContext {
 if (!_sharedGlobalEditingContext) {
   EOObjectStore* anOS = [EOEditingContext  defaultParentObjectStore];
   _sharedGlobalEditingContext = [[EOEditingContext alloc] initWithParentObjectStore:anOS];
   globalFetchLimit = [[NSUserDefaults standardUserDefaults] integerForKey:@"fetchLimit"];
 if (!globalFetchLimit)
   globalFetchLimit = 20;
 return _sharedGlobalEditingContext;
}
```

In addition, you might want to share WODisplayGroups in the same session, instead of putting DisplayGroups on every page. If you are displaying the same objects on multiple pages, you won't need to refetch them to get the same result set again or a subset of the original result set.

Cache the fetch results

If one page is slow and is accessed very frequently, you may want to add some code to cache recent fetches. If a fetch is repeated, the database will not be accessed the second time. A sample implementation of such a cache is provided in the download package that accompanies this article, as EOKeyValueCache.[hm]. In addition, the Application class needs to implement the EODatabaseContext delegate methods:

```
-databaseContext: shouldFetchObjectsWit hFetchSpecification: editingContext:
```

and

```
-databaseContext: didFetchObjects: fetchSpecification: editingContext:
```

to keep the cache up-to-date. Please note that this type of cache is primarily for read-only data, or data that changes infrequently.
Use raw rows

If you need to fetch very large amounts of data, you may want to use raw row fetches. This is a new feature in WebObjects 4; the API is documented in EOUtilities. You can also set raw mode fetching directly in the fetch specification using EOModeler. If you use raw row fetching, you will no longer be able to access to-many relationship information or use uniquing, but most fetches will execute at least twice as fast. Fetching objects with multiple relationships, or only fetching a subset of your attributes, will result in even greater speed improvements.

EOF has API to convert raw rows into enterprise objects, so once you have identified the objects you need, it is easy to put them into the editing context. To convert a raw row to an EO in Objective C, use the method:

```
eo = [globalEditingContext faultForRawRow:anObject entityName:@"Product"];
```

Cache primary key sequence values

If you notice poor performance on your Insert or Save Page, you may want to implement a better primary key generation mechanism to reduce the number of round trips to the database. One possibility is to use a batch of primary keys, instead of generating them each time.

For example, you can modify the SQL for the Oracle SEQUENCE to hand out sequences incremented by 100. Your application will grab a range of 100 primary keys and hand them out as needed. In addition, you will need to implement the EODatabaseContext delegate method databaseContext: newPrimaryKeyForObject:entity: in your Application.m file to return the proper primary key in case of a fast save. Be aware that if your application is restarted regularly, there will be gaps in the range of your primary keys.

Tune your database queries

Use the RDBMS "Explain Plan" functionality to get the exact execution plan, and verify that all of your queries are using indexes. If you are doing a case insensitive comparison, the database must do a full table scan and you will not be able to use indexing. If you are using Oracle and doing a LIKE comparison, you will need to turn off bind variables for that query and make sure that you aren't passing in a pattern that begins with a wildcard; otherwise you will not be able to use indexing. In addition, never mark a BLOB as used for locking. Instead of marking all attributes as used for locking, mark one attribute, preferably a 'date changed' attribute.

To turn off the use of bind variables, you can do something like:

[EOSQLExpression setUseBindVariables:NO];

Another possibility, on the MacOS X Server platform, is to set the user default named EOAdaptorUseBindVariables. For example, at a shell prompt, type:

```
defaults write NSGlobalDomain EOAdaptorUseBindVariables NO
```

Compile or wrap your EO's

If you have a few Enterprise Objects that are accessed a lot, moving them to Objective C can help. Consider compiling these objects and creating Java wrappers from them. You can add some code to your accessor methods to help determine which enterprise objects, if any, should be converted to Objective C. For example:

```
static int firstNameAccessorCount = 0;
public String firstName() {
 if ((++ firstNameAccessorCount % 1000) == 0)
  System.out.println("firstName accessor called " +
                firstNameAccessorCount + " times");
return firstName;
}
```

Of course, if you find that some enterprise objects or keys are being accessed very often, you should try to reduce the number of times they get called as well as wrapping them to speed up access.

Take advantage of EOModeler caching

With the EOModeler Advanced Entity Inspector, you can mark an entity as "cache in memory". EOF will evaluate queries against that entity in memory and avoid round trips to the database. This is most useful for read-only entities, since there is no danger that the cached data will get out of sync with the database data. Since EOF will keep all of the entity's objects in memory, this technique should only be used for small tables.

Use EOModeler to create fetch specifications

If you have an EOFetchSpecification object that will be used frequently, use EOModeler to create and store it in the model file, instead of re-creating it programmatically each time you perform a fetch.

WebObjects 4: SSL Example

The WebObjects SSL Example demonstrates the use of Secure Sockets Layer, or SSL, with WebObjects 4. For more information on the applications of this example and on using SSL with WebObjects, please see **article 70101**.

WARNING: The code contained in this example is not thread-safe and should not be used with multithreaded applications.

This article has been archived and is no longer updated by Apple.

Where to Find the Example

Download the SSL Example from Apple's FTP servers.

Building and using the Example

The example is distributed as a standard WebObjects framework. Please see **article 70101** for more information on using SSL with WebObjects applications.

DISCLAIMER

WebObjects 4: JDBC Adaptor

This document contains an unsupported database adaptor that allows WebObjects 4 users on Mac OS X Server and Windows NT to connect their WebObjects applications to JDBC databases. This package is not supported by Apple, Inc. and should be used at your own risk. The adaptor posted here is version 0.7; newer versions will be posted as they become available.
This article has been archived and is no longer updated by Apple.
Note: Any reference in this article to Mac OS X Server pertains to version 1.2, which was released prior to May 2001.

About the JDBC Adaptor

The JDBC Adaptor provided here was designed to allow WebObjects users to use JDBC data sources during application development. This adaptor is not a supported product of Apple, Inc.; use it at your own risk. This adaptor has not been optimized for performance; therefore, for performance reasons, Apple strongly discourages using this adaptor for application deployment.

Before You Install

Because of the immature nature of this release, it is important to keep Apple informed about your usage. It is strongly recommended that you send email to JDBCEOAdaptor@group.apple.com and include:

- Your name, company name and contact information
- Your WebObjects platform
- Your database and JDBC driver vendor and version

The JDBC EOAdaptor is a little complicated to install. The adaptor itself is only one piece, you will still need to install software from your database vendor, as well as some setting up a bundle to fix EOModeler's JVM initialization. Please read the installation instructions (both ours and your database vendors) in detail.

Installing the JDBC Adaptor on Mac OS X Server

1. **Download** version 0.7 of the Mac OS X Server version of the JDBC Adaptor from Apple's FTP servers.

2. At a shell prompt, type:

```
gnutar -xzf JDBCEOAdaptorOSX.tgz
```

This will create a folder called "JDBCEOAdaptor.framework".

3. Move this folder into /Local/Library/Frameworks

4. Launch EOModeler. In the EOModeler preferences, add:

```
/Local/Library/Frameworks/JDBCEOAdaptor.framework/Resources
```

to your list of "EOModeler Bundle Search Paths". This will make sure that a helper bundle which turns off fast JVM loading is loaded into EOModeler during startup This is needed to get the JDBC login panel to work.

NOTE: The JDBC-EOModelerFix.EOMbundle located in JDBCEOAdaptor.framework/Resources can also be used to fix ProjectBuilder so that the wizard's create new model will work. The trick here is that you might have a hard time with PB's bundle chooser since it wants to use bundles with '.bundle' extension and the fix is in a ".EOMbundle". In the worst case, you can either create your EOModels first using EOModeler and then run the wizard, or you can copy the bundle to the same name with a ".bundle" extension for PB.

5. Quit EOModeler and launch it again.

6. Go to the Workspace and bring up the console from the Tools menu. You should see a message telling you that "JDBCJVMFix" has initialized. If it has not, there is a problem with your installation.

7. Quit EOModeler.

Installing the JDBC Adaptor on Windows NT

1. **Download** version 0.7 of the Windows NT version of the JDBC Adaptor from Apple's FTP servers.

2. At a Bourne shell, type the following commands:

```
gunzip JDBCEOAdaptorNT.tgz
```

```
gnutar xf JDBCEOAdaptor.framework.NT.tar
```

This will create a folder called "JDBCEOAdaptor.framework".

3. Move this folder into ($NEXT_ROOT)/Local/Library/Frameworks

4. Move the file:

```
($NEXT_ROOT)/Local/Library/Frameworks/JDBCEOAdaptor.framework/JDBCEOAdaptor.dll
```

to:

```
($NEXT_ROOT)/Local/Library/Executables
```

5. Launch EOModeler. In the EOModeler preferences, add:

```
($NEXT_ROOT)/Local/Library/Frameworks/JDBCEOAdaptor.framework/Resources
```

to your list of "EOModeler Bundle Search Paths". This will make sure that a helper bundle which turns off fast JVM loading is loaded into EOModeler during startup This is needed to get the JDBC login panel to work.

NOTE: The JDBC-EOModelerFix.EOMbundle located in JDBCEOAdaptor.framework/Resources can also be used to fix ProjectBuilder so that the wizard's create new model will work. The trick here is that you might have a hard time with PB's bundle chooser since it wants to use bundles with '.bundle' extension and the fix is in a ".EOMbundle". In the worst case, you can either create your EOModels first using EOModeler and then run the wizard, or you can copy the bundle to the same name with a ".bundle" extension for PB.

6. Quit EOModeler and launch it again.

7. Bring up the Event viewer and check the Application events. You should see a message telling you that "JDBCJVMFix" has initialized. If it has not, there is a problem with your installation.

8. Quit EOModeler.

Installing the JDBC Drivers

Before you can use this adaptor, you will need to download and install JDBC drivers for your database. These drivers will normally be available from your database vendor; Apple cannot provide them.

Make sure that you are using:

- The Java 1.1.x version, not the Java 1.2 version.
- The 100% Pure Java version. (This is sometimes called the Type 4 version.)

Follow the vendor instructions to install the drivers and add the driver to the CLASSPATH environment variable. You should now be able to launch EOModeler and create a new model with "JDBC" as your adaptor type.

Sources for JDBC Drivers

Sybase drivers are available from Sybase. Go to:

http://www.sybase.com/products/allproductsa-z/softwaredeveloperkit/jconnect

Oracle drivers are available from Oracle. Go to:

http://www.oracle.com/technology/tech/java/java_db/index.html

Openbase drivers are included in the main product download. Go to:

http://store.openbase.com/cgi-bin/WebObjects/OpenBaseStore?openbase=1

SQLServer users can download a test version of i-net SPRINT, a Type 4 JDBC 2.0 driver for Microsoft SQLServer6.5 and 7.0, from:

http://www.inetsoftware.de. (A test-version of i-net

Driver Parameters

For your convenience, the following is a list of drivers and their associated connection parameters that have been used successfully with this adaptor.

Informix = {
JDBCDriverName = com.informix.jdbc.IfxDriver;
password = informix;
protocol = jdbc;
subname = "//somehost:1526/movies:INFORMIXSERVER=eof";
subprotocol = "informix-sqli";

```
username = informix;
};
ODBC = {
JDBCDriverName = sun.jdbc.odbc.JdbcOdbcDriver;
password = "";
protocol = jdbc;
subname = "dbName;";
subprotocol = odbc;
username = "";
};
OpenBase = {
JDBCDriverName = openbase.jdbc.ObDriver;
password = "";
protocol = jdbc;
subname = "//hostname/dbName";
subprotocol = openbase;
username = "";
};
Oracle = {
JDBCDriverName = oracle.jdbc.driver.OracleDriver;
password = tiger;
protocol = jdbc;
subname = "thin:@localhost:1521:ORCL";
subprotocol = oracle;
username = scott;
};
Sybase = {

JDBCDriverName = com.sybase.jdbc.SybDriver;
password = "";
protocol = jdbc;
subname = "localhost:3696/dbname";
subprotocol = "sybase:Tds";
username = sa;
}
```

WebObjects: WebObjects Guides

These WebObjects Guides were written by Theresa Ray with input from Apple Enterprise Support and Apple Worldwide Developer Relations technical staff. They were originally provided on the Apple Developer CD series provided by Apple Developer Connection.

Theresa Ray is a Senior Software Consultant for Tensor Information Systems in Fort Worth, TX. She has programmed with WebObjects and the AppKit interface on projects for a wide variety of clients including the U.S. Navy, the United States Postal Service, America Online, and Lockheed-Martin. Her experience spans all versions of WebObjects from 1.0 to 4.0, EOF 1.1 to 3.0, NEXTSTEP 3.1 to OPENSTEP 4.2, Rhapsody and MacOS X Server. In addition, she is an Apple-certified instructor for WebObjects courses.

For more information on Apple Developer Connection, please visit:

http://www.apple.com/developer

One of the best resources for all WebObjects programmers, regardless of experience level, is Apple's on-line technical documentation. Apple's technical documentation can be found at:

http://developer.apple.com/techpubs/enterprise/WebObjects/WebObjectsTOC.html

This article has been archived and is no longer updated by Apple.

WebObjects Tools and Techniques

Whether you are creating a new WebObjects application or maintaining an existing one, proficiency in using the ProjectBuilder, EOModeler and WebObjects Builder tools is essential. This survival guide enumerates tips and techniques which will allow you to enhance and tailor these tools to suit your programming needs and personal style.

Learning EOModeler

Learning how to effectively use the EOModeler application is an essential beginning to the development of any database driven web site. This survival guide explains the most commonly used features and options available in the EOModeler application.

Performance Tuning, Part I and Performance Tuning, Part II

Performance tuning your WebObjects application is a critical step on the road to successful deployment of a web site. Optimization of a web site is always productive, only costs a moderate amount of development time, and results in a solid, scalable system. By properly coding, testing and administrating your application, your web site can be a great success!

Categories and Posers

Categories and posers are powerful mechanisms for extending and/or replacing the behavior of classes for which you cannot update the source. These techniques are essential tools that every WebObjects programmer should understand.

Debugging WebObjects

A quick reference guide to the major topics involved in debugging a WebObjects application including ProjectBuilder's debugging tools for both Objective-C and Java applications, as well as other logging and debug techniques available outside ProjectBuilder.

Building Custom Frameworks with WebObjects

A framework can be defined as a set of classes and other resources commonly available to many applications. Learning to use and create frameworks effectively will have a positive affect on your application development cycle-time and reliability. When you write an object-oriented program, you rarely do it from scratch. There are almost always class definitions available that you can use. All you need are the class interface files, a library with compiled versions of the class implementations, and some documentation. In OpenStep/Yellow Box, groups of well-defined object-oriented classes with specific behavior are organized in structures known as frameworks.

Design For Reuse

One of the biggest challenges facing today's programmers is the issue of "design for reuse". Every application has a specific set of requirements and goals which requires some customized code, but starting the code from scratch on every project is not the best use of your company's available resources. Obviously, the average application will consist of both reusable and application-specific code, but how do you determine the best way to segment your code? The best application design starts with a good project architecture. Design patterns, such as the Model-View-Controller design pattern, can help you structure your application in the most efficient way.

Advanced Web Site Management and Techniques Using WebObjects

Designing a cost-effective, manageable, technically powerful web site is not an issue to be taken lightly. You've worked hard to develop your application, but if the users have difficulty connecting to that application, or poor performance from that application due to insufficient server resources, all of your hard work may be in vain. This survival guide addresses the questions and issues faced by companies seeking to provide a

scalable, robust deployment for their applications.

Debugging WebObjects

A quick reference guide to the major topics involved in debugging a WebObjects application including ProjectBuilder's debugging tools for both Objective-C and Java applications, as well as other logging and debug techniques available outside ProjectBuilder.

Design For Robustness

A quick reference guide to the major topics involved in designing abulletproof WebObjects application including application coding techniques, application configuration options, multi-platform development and testing.

Frameworks

A framework can be defined as a set of classes and other resources commonly available to many applications. Learning to use and create frameworks effectively will have a positive affect on your application development cycle-time and reliability.

Porting Objective-C to Java

A quick reference guide to the major topics and tips involved converting an Objective-C application or Framework to Java.

WebObjects Database Connectivity, Part I and **WebObjects Database Connectivity, Part II**

Creating powerful websites for your users often involves integration with a database for storage and retrieval of information. WebObjects provides efficient access to nearly every database on the market through it's Enterprise Object Frameworks (EOF). EOF allows you to map the information stored in your database to business objects used by your applications - whether web based or windowed. And by putting your business logic into one set of objects used by all your applications, behavior such as validation, data conversion, or security restricted access is guaranteed to be the same no matter which application is accessing the data.

WebObjects Memory Management

Regardless of the technology used to create it, memory management techniques can make or break an application. This is especially true for web applications, where response times need to be very fast, and the memory footprint an application requires determines how many instances of that application that one server can manage. The memory management techniques required in a compiled WebObjects application (or any compiled OPENSTEP application) are fairly straightforward, but are usually not well understood by programmers new to this technology. Hopefully, this survival guide will make these issues clear so that developers will be able to create leak-free, crash-free applications.

Working with WebObjects

An introductory overview to WebObjects and to WebObjects development.

WebObjects 4: "fatal error LNK1106"

This article explains why a WebObjects developer on Windows NT might see the error message:

```
fatal link error LNK1106
```

when linking new or updated libraries into their WebObjects application.

This article has been archived and is no longer updated by Apple.
WebObjects 4.01 on Windows NT uses version 3.10 of the Microsoft linker. Microsoft has released a new version of the linker, version 6.00, which uses a different file format than previous linker versions. As a result, libraries created with link.exe version 6.00 can not be used with any previous version of the Microsoft linker, including the versions Apple is licensed to provide with WebObjects. The new Microsoft linker is included in Microsoft development products such as Visual C++ 6.0.

The error:

```
fatal link error LNK1106
```

occurs when WebObjects encounters a library in a format it does not understand. In order avoid the error, the library must be rebuilt with link.exe version 5.00 or earlier. Only libraries built with link.exe version 5.00 or earlier can be linked into WebObjects 4 applications.

WebObjects 4: Monitor FAQ

This article contains frequently asked questions (FAQ) regarding WebObjects 4 and the WebObjects Monitor utility, with answers to those questions. For general deployment questions, see the WebObjects 4 Deployment FAQ, **article 70001**.

Please be aware that Monitor works very differently in WebObjects 4.5 than it does in WebObjects 4. Most of this information no longer applies to WebObjects 4.5. For more information on using Monitor with WebObjects 4.5, please see the WOInfoCenter on your local WebObjects 4.5 system.

This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. How do Monitor and MonitorProxy communicate?
2. If I want to make Monitor talk to a MonitorProxy through a firewall, what ports should I open up?
3. How do I specify which port a given application will reside on?
4. Who holds on to the scheduling information for WebObjects applications--Monitor or MonitorProxy?
5. Why do I have instances running that the Monitor can't communicate with?
6. Why doesn't Monitor notice when my applications die?
7. How do I run MonitorProxy (or Monitor) to make sure that if it dies, it'll respawn?

Question 1: How do Monitor and MonitorProxy communicate?

Answer: As of WebObjects 4, Monitor and MonitorProxy communicate via Apple's Distributed Objects (DO) protocol.

Question 2: If I want to make Monitor talk to a MonitorProxy through a firewall, what ports should I open up?

Answer: You'll need to open up the following ports:

Port	Protocol
2453	tcp
7656	udp
7657	udp

Question 3: How do I specify which port a given application will reside on?

Answer: Use **-WOPort <port_number>** as the argument to any WO Application. As long as that port is currently available, the application will launch and will register to the given port. If the port you specify is already in use, the application will exit with a "Could not register with nameserver" error.

Question 4: Who holds on to the scheduling information for WebObjects applications--Monitor or MonitorProxy?

Answer: Monitor. Monitor talks directly to the applications. MonitorProxy is not involved in scheduling at all. In addition the applications do not hold onto any scheduling information. If Monitor dies, your scheduling will die until Monitor is back up.

The scheduling information is stored in the Monitor.conf file, located in NEXT_ROOT/Apple/Library/WebObjects/Configuration.

Question 5: Why do I have instances running that the Monitor can't communicate with?

Answer: This may happen when you are using the "Start auto recovery application when Monitor starts" setting. If your application takes more than thirty seconds to start up, the WebObjects auto-recover feature will time out and WebObjects will try to start a second instance. The second instance will fail because the first instance is using the port; there will now be a WebObjects application running with no connection to the Monitor. Make sure that your applications start in less than thirty seconds if you want to use this procedure (this should not be a problem for most WebObjects applications.)

Question 6: Why doesn't Monitor notice when my applications die?

Answer: WebObjects 4 uses DO to determine when an application has died. If the application server and the Monitor host are on different subnets, the DO message (a broadcast message) will not be received by the Monitor system. As a result, stopped applications will appear still to be running.

Question 7: How do I run MonitorProxy (or Monitor) to make sure that if it dies, it'll respawn?

Answer: Use MonitorDaemon. Depending on which application you specify, MonitorDaemon will execute and keep up either Monitor or MonitorProxy. Usage is fairly straightforward:

```
MonitorDaemon Monitor
```

or

```
MonitorDaemon MonitorProxy
```

In NT, you will want to first install MonitorProxy as a service and then configure it to start automatically. To install MonitorProxy or Monitor as a service, type "MonitorDaemon.exe -InstallMonitorProxy" or "MonitorDaemon.exe -InstallMonitor". Then go to the Services panel within the Control Panel and select the MonitorProxy or Monitor service. Set that service to start on boot up.

In UNIX, Monitor/MonitorProxy's startup should be in a start up script. Here is an example script for Solaris that starts Monitor on port 3000:

```
#!/sbin/sh
#
#       MonitorDaemon (Monitor) Startup Script
#       Damien Weiss
#       Apple Computer
#       March 1, 1999
#
#ident  "@(#)womonitor  1.0     99/03/01 DAW"

# The FILE variable is just the path to the executable.  MONITOR is the
# actual command line that is executed.

FILE="/opt/Apple/Library/WebObjects/Applications/Monitor.woa/MonitorDaemon"

MONITOR="/opt/Apple/Library/WebObjects/Applications/Monitor.woa/MonitorDaemon
/opt/Apple/Library/WebObjects/Applications/Monitor.woa/Monitor -WOPort 3000"

case "$1" in
'start')
       if [ -f ${FILE} ]; then
               ${MONITOR} >/dev/null 2>&1 &
       fi

       ;;

'stop')
       pid_daemon=`/usr/bin/ps -eo pid,comm | /usr/bin/awk '{ if ($2 =="/opt/Ap
ple/Library/WebObjects/Applications/Monitor.woa/MonitorDaemon") print $1 }'`
       pid_monitor=`/usr/bin/ps -eo pid,comm | /usr/bin/awk '{ if ($2 =="/opt/A
pple/Library/WebObjects/Applications/Monitor.woa/Monitor") print $1}'`
       if test "$pid_daemon"
       then
               /usr/bin/kill $pid_daemon
               /usr/bin/kill $pid_monitor
       fi

       ;;

*)
       echo "Usage: $0 { start | stop }"
       exit 1
       ;;
esac
exit 0
```

WebObjects: WebObjects and Windows 2000

Q: What version or versions of WebObjects will run under Windows 2000?
This article has been archived and is no longer updated by Apple.
A: Windows 2000 is a supported platform for WebObjects 4.5. However, WebObjects 4.5 Update 1 or later is required to address certain issues on this platform. See the WebObjects Current Patch List for information on the most current updates for Windows 2000.

WebObjects 4.0.1 and earlier versions of WebObjects were developed and tested using Windows NT 4.0. These versions of WebObjects were not developed for, nor tested on, Windows 2000. Apple does not warrant that WebObjects 4.0.1 or any previous version of WebObjects will work on Windows 2000. Apple does not intend to do comprehensive regression testing of these products on Windows 2000, and does not intend to provide updates and/or patches to make such products compatible with Windows 2000.

WebObjects 4: Troubleshooting Broken Images

This is a troubleshooting guide for broken images in WebObjects applications. A "broken image" is one that is not displayed correctly by the web browser, either because of an error in an IMG tags or because an image file is missing from the web server.
This article has been archived and is no longer updated by Apple.
If you see broken images in your WebObjects application, check the following four items:

1. Is your app running in Direct Connect mode?

Running in Direct Connect mode bypasses your web (HTTP) server; therefore, images in the web server's document root directory won't load. You're probably using Direct Connect mode if your URL contains a port number, i.e.:

`http://localhost:4398/..`.

This is the default mode in WebObjects. If you are using Direct Connect, when you view your application's HTML source (with the browser View Source command), your IMG tags will have this format:

```
<IMG src="/cgi-bin/WebObjects.exe/ImageTest.woa/wr?wodata=pathname">
```

There are two ways to fix these broken images:

- Don't use Direct Connect mode. Use either the launch option "-WODirectConnectEnabled NO", or the command-line "defaults write MyAppName WODirectConnectEnabled NO".
- Don't use IMG tags in your HTML. Instead, use the WOImage dynamic element.

2. Look for correctly formed IMG tags

Use your browser's View Source command to see the HTML that is being sent to the browser. (This alone is a handy troubleshooting tip that is often overlooked.)

A correctly formed IMG tag will look something like this:

```
<IMG src="/WebObjects/ImageTest.woa/WebServerResources/foo.jpg">
```

If your image tags are missing some of the components:

```
<IMG src="/WebObjects/ImageTest/foo.jpg">
```

then you should take the following steps:

- Turn off Direct Connect mode. See above for details. (Note, this is probably already off if you're seeing IMG tags with "/WebObjects" in them.)
- Do a "split install". First, edit Makefile.preamble to uncomment the line containing INSTALLDIR_WEBSERVER. Then build using the "install" target. This will copy your web server resources (i.e., images) into the web server's document root.
- Set NSProjectSearchPath. You may use the launch option "-NSProjectSearchPath "()"", or the command-line "defaults write MyAppName NSProjectSearchPath "()"".

Please note that the default NSProjectSearchPath is "(../..)", which is relative to the application executable. When running from the source directory, "../.." is usually one level up from the PB.project. The resource manager then searches all subdirectories for a directory matching PROJECTNAME, and looks in there for resources. If one is found, it prepends the value of WOApplicationBaseURL to its pathname to get something like "/WebObjects/ImageTest/foo.jpg".

After changing NSProjectSearchPath, it is sometimes necessary to rebuild using the "install" target.

3. Look for error messages in the IMG tags

When you view your document source, your IMG tags may look like this (for a Direct Connect application):

```
<IMG src="/cgi-bin/WebObjects.exe/ImageTest.woa/wr?wodata=ERROR_NOT_FOUND_framework_*nil*_filename_foo.jpg">
```

or like this (for a non-Direct Connect application):

```
<IMG src="/ERROR/NOT_FOUND/app=ImageTest/filename=foo.jpg">
```

To fix either of these problems, take the following steps:

- Check your image names for typos and correct capitalization. Remember that Windows NT is case-insensitive, and Unix platforms (MacOS X Server, Solaris, HP-UX) are case-sensitive. An image that works on Windows NT will not work on Unix if the capitalization is not consistent.

- If the image is in a framework, make sure you're not trying to reference it with a relative pathname. For example, if you're using the filename = "../foo.jpg", remove the "../" and let the resource manager find the image for you.

4. Is the correct image displayed?

Sometimes you may see the wrong image displayed correctly, or an image with the correct filename but from a different directory. These problems can usually be corrected by setting NSProjectSearchPath. You may use the launch option "-NSProjectSearchPath "()"", or the command-line "defaults write MyAppName NSProjectSearchPath "()"".

This problem happens when you have two copies of a project in a common directory. Even if the two projects are in subdirectories with different names, they will have the same internal name (identified by PROJECTNAME in the PB.project file), and the resource manager can't tell the difference unless NSProjectSearchPath is set.

WebObjects 4.0.1 Patch 1 Overview

This patch is now obsolete. Please see the WebObjects Current Patch List, article 70037, for information on the most current patches for WebObjects and Enterprise Objects Framework. This obsolete patch is provided here as a convenience to our customers who have not yet upgraded to the most current patch level.
This article has been archived and is no longer updated by Apple.

About WebObjects 4.0.1 Patch 1

The version of gnutar which shipped with WebObjects 4.0.1 did not accept four-digit dates as arguments to a specific option. While this feature is not used directly by WebObjects, Apple recommends that all users of WebObjects 4.0.1 install this patch. WebObjects developers should also read **article 70135** for an explanation of some manual steps they may wish to take to avoid some Year 2000 issues with the WebObjects examples.

Installing WebObjects 4.0.1 Patch 1 on Windows NT 4.0

1. Download **WO401NTPatch1.exe**, the patch installer for Windows NT.

2. Run this executable to uncompress the patch installer, WO401Patch1Installer.exe.

3. Log in as a user with Administrator privileges.

4. Make sure that there are no WebObjects, OPENSTEP or EOF applications running.

5. Double-click on the patch installer, WO401Patch1Installer.exe, to start the install process.

6. A screen will appear with some information about this patch. After you have read it, click "Next" to continue.

7. The license agreement for this patch will appear. To agree to the license and continue the installation, click "Yes".

8. The patch will now be installed on your system and you will be asked if you want to reboot. Select "Yes, I want to restart my computer now" to reboot your Windows NT system. The WinZip self-extractor will automatically quit and remove the temporary installation in about 20 seconds.

9. For WebObjects developer installations, see **article 70135**. There are manual steps you must take to avoid some century issues

Installing WebObjects 4.0.1 Patch 1 on Solaris and HP-UX

1. Download **WO401SolarisPatch1.TAR.Z**, the patch installer for Solaris, or **WO401HPUXPatch1.TAR.Z**, the patch installer for HP-UX.

2. Log in as root. If you're not sure how to log in as root, see your system administrator.

3. Make sure that there are no WebObjects, OPENSTEP or EOF applications running.

4. Change to the directory containing the patch and the patch installer, "patcher.sh".

5. At a shell prompt, type:

patcher.sh -install WO401SolarisPatch1.TAR.Z

-OR-

patcher.sh -install WO401HPUXPatch1.TAR.Z

For more information on using the "patcher.sh" program, type the following at the command prompt:

patcher.sh -help

6. Restart your Unix system.

Issues Addressed

Corrected in WebObjects 4.0.1 Patch 1

'gnutar' command didn't accept dates later than 1999
Apple Reference #2405644

ISSUE:
The 'gnutar' command has an option to only write files newer than a given date, but version 1.11.2, the version shipped with WebObjects 4.0.1,

didn't accept dates past the end of 1999, even using four-digit years.

RESOLUTION:
'gnutar' has been updated to version 1.12, which accepts dates after 1999.

Published Date: Feb 20, 2012

WebObjects 4: Correcting Century Issues in the WebObjects 4.0.1 Examples

Some of the examples included with WebObjects 4.0.1 use two-digit or three-digit date values. While this will not affect the average user's development or deployment of WebObjects applications, is not consistent with Apple's recommended date-handling practice. This article provides instructions on how to change these examples to use the preferred four-digit year format. In addition, WebObjects 4.0.1 users should install WebObjects 4.0.1 Patch 1, described in **article 70134**, which contains an updated version of the gnutar utility with enhanced date-handling capabilities.

This article has been archived and is no longer updated by Apple.

ModelerBundle

The ModelerBundle example in the Enterprise Objects Examples on WebObjects 4.0.1 uses a two-digit year format for dates. The string is only used for display, not editing, so there is no problem with the function of the example. However, this is not preferred usage for Year 2000 compliant applications. The Apple reference number for this bug is 2414932.

Customers can edit the source for this example and rebuild it if a four-digit year format is desired. In $NEXT_ROOT/NextDeveloper/Examples/EnterpriseObjects/ModelerBundle/CustomeColumns.m, change the date format on line 67 from %y to %Y:

```
67c67
<         formatter = [[NSDateFormatter alloc]
initWithDateFormat:@"%m/%d/%y: %H:%M" allowNaturalLanguage:NO];
---
>         formatter = [[NSDateFormatter alloc]
initWithDateFormat:@"%m/%d/%Y: %H:%M" allowNaturalLanguage:NO];
```

Rebuild the example according to the instructions in the EnterpriseObjects directory.

ElementTour

The WebObjects Java example "ElementTour" calls java.util.Date.getYear() without correcting for the fact that the value returned by this method is "years since 1900". The result is two-digit years through 1999, and three-digit years thereafter. This is not the preferred usage for Year 2000 compliant applications. The Apple reference number for this bug is 2415034

Customers who wish to correct this behavior may achieve this by making the following modifications in the example source and recompiling.

Add 1900 to the value returned by java.util.Date.getYear() in the following location:

$NEXT_ROOT/Developer/Examples/WebObjects/Java/ElementTour/ODE.java, line 13

Change:

```
        "today.getMonth()+1,\\"/\\",today.getDate(),\\"/\\",today.getYear());";
```

To:

```
        "today.getMonth()+1,\\"/\\",today.getDate(),\\"/\\",today.getYear() + 1900);";
```

Â

FDF1040EZ

The WebObjects Java example "FDF1040EZ" calls java.util.Date.getYear() without correcting for the fact that the value returned by this method is "years since 1900". The result is two-digit years through 1999, and three-digit years thereafter. This is not the preferred usage for Year 2000 compliant applications. The Apple reference number for this bug is 2415036.

Customers who wish to correct this behavior may achieve this by making the following modifications in the example source and recompiling.

In the file $NEXT_ROOT/Developer/Examples/WebObjects/Java/FDF1040EZ/TenFortyEZ.java:
Add the following to the import statements at the top of the file:
import java.text.*;
import java.util.*;

Change lines 111 and 112:

```
        java.util.Date d=new java.util.Date();
```

```
return " "+d.getMonth()+"/"+d.getDate()+"/"+d.getYear();
```

To:

```
return DateFormat.getDateInstance(DateFormat.SHORT).format(new Date());
```

Published Date: Feb 20, 2012

WebObjects: gnutar changes in Apple patches

Several Apple Enterprise and NeXT products included the GNU 1.11.2 version of tar, which for certain operations did not handle dates after 1999 properly. A newer version of tar based on the GNU tar-1.12 source has been provided in Apple patches for many affected products on Mach, Solaris, and HP-UX platforms. This newer version of tar, while correcting all known Year 2000 issues, may have unwanted side effects for some users. In an effort to minimize these side effects, Apple made some modifications to the standard version of GNU tar-1.12.

This document describes the changes Apple made to the GNU tar-1.12 source. In addition, it discusses potential problems Apple users may encounter using GNU tar-1.12 on older systems, and provides workarounds for them.

This article has been archived and is no longer updated by Apple.

Which products and patches are affected?

The Apple Enterprise Software product patches which include an updated version of gnutar include:

- NeXTSTEP 3.3 Patch 2 and subsequent NeXTSTEP 3.3 patches
- OPENSTEP 4.2 Patch 4 and subsequent OPENSTEP 4.2 patches
- WebObjects 3.1 Patch 1 and subsequent WebObjects 3.1 patches
- WebObjects 3.5.1 Patch 4 and subsequent WebObjects 3.5.1 patches
- WebObjects 4.0.1 Patch 1 and subsequent WebObjects 4.0.1 patches

For complete information on the current patches available for Apple Enterprise Software products, please see the NeXTSTEP Current Patch List, the OPENSTEP Current Patch List, and the WebObjects Current Patch List

Apple modifications to tar

GNU tar-1.12 expects a more recent version of the system header file 'stat.h' than the one shipped with OPENSTEP and NeXTSTEP. Some of the symbols defined in stat.h have changed, including the symbolic link symbol, formerly _S_IFLNK, now S_ISLNK. A test in the file tar-1.12/src/system.h in the GNU source distribution (lines 144-148) defines 'lstat' to be 'stat' if the newer symbolic link symbol is not found, with the result that symbolic links are not processed properly:

```
#include <sys/stat.h>

#ifndef S_ISLNK
# define lstat stat
#endif
```

Since there is code later in the same file which correctly handles the older symbols, Apple modified the code above as follows:

```
#include <sys/stat.h>

#ifndef S_ISLNK
/* # define lstat stat */
#endif
```

This was the only modification made to the GNU tar 1.12 source files for Apple's patches.

Problems which may be encountered due to changes between GNU tar-1.11.2 and GNU tar-1.12

When processing input being read from a pipe, the older version of tar read only the contents of the .tar file and then exited. But tar-1.12 continues to read from the pipe (discarding the data) until the pipe is closed, even after the .tar file ends.

Because of this change, some third-party OPENSTEP and NeXTSTEP applications may not be fully compatible with the gnutar. This is known to affect Quantrix.app and Concurrence.app. Information on a Quantrix-specific workaround is available as **article 70128**.

For other applications, you may need to copy the original gnutar from your installation media and reinstall it on your system. You may need to edit the application binary or an application-specific configuration file to force the application to use this version of gnutar.

Building GNU tar-1.12 on NeXTSTEP or OPENSTEP

In order to build GNU tar-1.12 on NeXTSTEP or OPENSTEP, you must modify one of the files which is automatically generated by the 'configure' script included in the GNU tar-1.12 distribution. To make the modification:

1. Run 'configure'

2. Using a text editor, make the following change in the config.h file:

Change:

/*#undef HAVE_UNION_WAIT */

To:

#define HAVE_UNION_WAIT 1

3. Run 'make' to compile the package.

Consult the INSTALL documentation included in the GNU tar-1.12 distribution for additional information on building the package.

WebObjects 4: Understanding Worker Threads and WOWorkerThreadCount

This article describes the role of worker threads in a WebObjects application, and explains how to use the WOWorkerThreadCount option to manage them.
This article has been archived and is no longer updated by Apple.

The Job of a Worker Thread

When a request arrives at the WebObjects application, the request data is held in a socket stream. In multi-threaded mode, the pool of worker threads is idle until a socket is queued, whereupon they wake up and one grabs the active socket. The worker thread reads a request from the active socket and creates a WORequest object. It then invokes the dispatchRequest method, which determines the appropriate request handler and invokes the handleRequest method on it. In single-threaded mode, of course, all of the above operations is done by one thread.

At this point, in protected multi-threaded mode, lockRequestHandling is called. This protects user code from the ambiguity problems inherent in multi-threaded environments. Bear in mind that if you override the dispatchRequest method to set some application variables before calling super's dispatchRequest method, those variables may get out of sync and cause undesirable side effects.

A worker thread processes an individual request and generates a response, via the usual takeValuesFromRequest, invokeAction and appendToResponse methods. It's worth pointing out that resource requests are handled without locking request handling, and therefore do not impact any TPM limits which may be imposed on you by your licence.

About WOWorkerThreadCount

The WOWorkerThreadCount setting controls the number of worker threads started by the default WebObjects adaptor, WODefaultAdaptor. By default, WOWorkerThreadCount is set to 8. What this means is that eight worker threads will be started when the application is launched. The adaptorsDispatchRequestsConcurrently method of WOApplication determines whether requests are processed concurrently or not. It also doubles as a flag to indicate single-threaded operation vs. multi-threaded operation. Remember that setting adaptorsDispatchRequestsConcurrently to true requires that the application be thread-safe.

Setting WOWorkerThreadCount to 0 will force your application to run in single-threaded mode. In this mode, a single thread is responsible for polling for new requests on the listen socket, running the main runloop (for timers, D.O. activity, etc.) and processing the requests that arrive and generating responses, as described above.

Performance Considerations

Finally, a few notes on the performance implications of threads in WebObjects 4:

- A static resource which doesn't require a request/response cycle, such as a JPEG image file, will be served directly by the Web server without involving any WebObjects worker threads. However, a WebObjects resource, such as a WOImage dynamic element representing a JPEG image, becomes part of the request/response loop and will be affected by WOWorkerThreadCount settings.
- Using WOWorkerThreadCount=0 only makes sense if your app is not at all multi-threaded. If your application is written in Java or uses NSThread elsewhere, you are better off using the default setting.
- Garbage collection runs differently in single-threaded mode than it does in multi-threaded mode. For more information on how multi-threaded garbage collection works, see **article 70086**.
- In multi-threaded mode, all socket I/O is multi-threaded.

Published Date: Feb 20, 2012

WebObjects 4.0.1 Patch 2 Overview

This document contains an overview and download information for Apple's Patch 2 for WebObjects Release 4.0.1. Apple recommends that users of WebObjects 4.0.1 install this patch set on Mac OS X Server 1.0 and HP-UX. Users on other platforms, including Mac OS X Server 1.2, Solaris, and Windows NT, should install **WebObjects 4.0.1 Patch 3**.

WebObjects 4.0.1 Patch 2 includes all of the fixes from WebObjects 4.0.1 Patch 1. If you have already installed WebObjects 4.0.1 Patch 1 on your system, you can install Patch 2 over your existing installation. If you have not installed Patch 1, you do not need to.

The WebObjects Current Patch List, **TIL article 70037**, contains information on all available patches and workarounds for all versions of WebObjects, including EOF patches. Please read this document if you're not sure which patches you need on your system.

This article has been archived and is no longer updated by Apple.
Note: Any reference in this article to Mac OS X Server pertains to version 1.0.x (1.0-2, for example), which released prior to version 1.2.

Before You Install (Windows NT)

Windows NT users who have customized their WindowsName.table time zone assignment file should back up that file before installing this patch and restore their custom file after this patch is installed. This patch installs a new copy of WindowsName.table which contains different default assignments for some Windows time zones.

Before You Install (Mac OS X Server)

This version of the patch is intended for Mac OS X Server versions prior to 1.2. Do not install this patch on Mac OS X Server 1.2.

Mac OS X Server users who have customized their tnsnames.ora Oracle database configuration file should back up that file before installing this patch and restore their custom file after this patch is installed. This patch will overwrite your tnsnames.ora file.

Installing WebObjects 4.0.1 Patch 2 on MacOS X Server 1.0

1. Download **WO401OSXPatch2.pkg.compressed**, the patch installer for Mac OS X Server.

NOTE: Some versions of OmniWeb for Mac OS X Server incorrectly add a .Z file extension to downloads in .compressed format. If the file you download has an extension of .compressed.Z, rename it to .compressed or it will not be correctly uncompressed by OpenUp.

2. Uncompress the patch file. Your web browser or FTP client may perform this step for you.

2. Log in as root on your Mac OS X Server system. If you're not sure how to log in as root, see your system administrator.

3. Double-click on the WO401MacOSXSPatch2.pkg file.

4. Click the Install button in the Installer package window. An Install Package panel will open.

5. Make sure that there are no other WebObjects or EOF applications running.

6. Click 'Install' in the Install Package panel and, when prompted for confirmation, click OK to proceed. The Installer window displays information about the progress of the installation, which may take several minutes.

7. When the installation completes, the system must be rebooted. Log out and use the reboot button on the login panel.

Installing WebObjects 4.0.1 Patch 2 on Windows NT 4.0

1. Download **WO401NTPatch2.exe**, the patch installer for Windows NT.

2. Log in as a user with Administrator privileges.

3. Make sure that there are no WebObjects, OPENSTEP or EOF applications running.

4. Double-click on the patch installer, WO401NTPatch2.exe, to start the install process.

5. A screen will appear with some information about this patch. After you have read it, click "Next" to continue.

6. The license agreement for this patch will appear. To agree to the license and continue the installation, click "Yes".

7. The patch will now be installed on your system and you will be asked if you want to reboot. Select "Yes, I want to restart my computer now" to reboot your Windows NT system. The WinZip self-extractor will automatically quit and remove the temporary installation in about 20 seconds.

8. For WebObjects developer installations, see **TIL article 70135**. There are manual steps you must take to avoid some century issues

Installing WebObjects 4.0.1 Patch 2 on Solaris and HP-UX

1. Download **WO401SolarisPatch2.TAR.Z**, the patch installer for Solaris, or **WO401HPUXPatch2.TAR.Z**, the patch installer for HP-UX. Also download the patch installer, **patcher.sh**.

2. Log in as root. If you're not sure how to log in as root, see your system administrator.

3. Make sure that there are no WebObjects, OPENSTEP or EOF applications running.

4. Change to the directory containing the patch and the patch installer, "patcher.sh".

5. At a shell prompt, type:

patcher.sh -install WO401SolarisPatch2.TAR.Z

or

patcher.sh -install WO401HPUXPatch2.TAR.Z

For more information on using the "patcher.sh" program, type the following at the command prompt:

patcher.sh -help

6. Reboot your Unix system

Issues Addressed

Corrected in WebObjects 4.0.1 Patch 2

Application hangs if a Sybase stored procedure is missing from the database
Apple reference #2309889

ISSUE:
If an EOF application called a stored procedure that was not actually in the database, the db_ctx structure that ct_lib uses was not cleaned up, leaving the entire application unusable.

RESOLUTION:
EOF now detects that a stored procedure is missing, cleans up the server command structure, and raises an exception normally in the application.

SybaseChannel doesn't raise an exception when execution of a stored procedure fails.
Apple reference # 2309891

ISSUE:
The SybaseEOAdaptor did not raise the current exception if execution of a stored procedure failed. Thus, in some cases, the developer had no way to handle the failure.

RESOLUTION:
An exception is now raised in the failure case. See also Apple Reference 2309889.

String conversion for case-insensitive comparison should all be done by the database
Apple reference #2309907

ISSUE:
In case-insensitive comparison of a value string with a database column, the EOF adaptors uppercased the value string but relied on the database itself to uppercase the column. If there was any difference in the way uppercasing was performed by the adaptor and the database, comparison would fail incorrectly.

RESOLUTION:
The EOF adaptors now have the database uppercase both the value string and the column, to eliminate possible inconsistency.

Sybase varbinary type mapped to incorrect Foundation type
Apple reference #2309912

ISSUE:
The SybaseEOAdaptor's -internalTypeForExternalType: model: method incorrectly mapped the Sybase "varbinary" type to "NSString".

RESOLUTION:
This method now correctly maps "varbinary" to "NSData".

SybaseEOAdaptor's binaryID prototype should map to Sybase binary type
Apple reference #2309918

ISSUE:
The SybaseEOAdaptor's binaryID prototype should be mapped to the Sybase binary type rather than the varbinary type.

RESOLUTION:
The EOSybaseAdaptorPrototype.plist mapping of binaryID has been changed to Sybase binary.

EOF fails silently if an entity name is typed incorrectly.
Apple reference #2309929

ISSUE:
EOF could silently fail in cases where an entity name had been typed incorrectly (misspelled or miscased), the model name had been updated in the model file but not in the program code, or the model group had been constructed incorrectly.

RESOLUTION:
EOObjectStoreCoordinator's -objectsWithFetchSpecification: editingContext: method now detects these conditions and raises appropriate exceptions.

Can't use object-based qualifiers with raw row fetches.
Apple reference #2309931

ISSUE:
Object-based qualifiers could not be used with raw row fetches.

RESOLUTION:
The raw row fetch code has been changed to transform object-based qualifiers to schema-based qualifiers before performing the fetch.

ODBC adaptor generates spurious login error message
Apple reference #2309933

ISSUE:
The first time the user tried to connect to the ODBC database when defining a new model (or switching adaptors to ODBC), an invalid login error message was encountered. If the user proceeded to log in with the correct name and password everything worked, but the error was misleading.

RESOLUTION:
The connnection information for the initial login panel is now properly constructed.

Leak in EODatabaseContext avaliableChannel method
Apple reference #2309934

ISSUE:
The -availableChannel method of EODatabaseContext leaked one object for each EODatabaseChannel object allocated.

RESOLUTION:
This leak has been fixed.

EODatabase never releases snapshots
Apple reference #2315267

ISSUE:
Snapshots associated with enterprise objects were never released.

RESOLUTION:
EOF now tracks references to an object and releases the object's snapshot when there are no more references to it.

Optimistic locking fails on Oracle for rows with trailing spaces
Apple reference #2315268

ISSUE:
OracleEOAdaptor stripped trailing spaces from VARCHAR2 data fetched from or committed to an Oracle database. If VARCHAR2 data containing trailing spaces had been inserted by another tool, optimistic locking failed for any affected row and the row could not be updated.

RESOLUTION:
OracleEOAdaptor no longer strips trailing spaces from VARCHAR2 data.

Deleting newly inserted objects fails
Apple reference #2315270

ISSUE:
An object created and inserted into an editing context or relationship, then deleted before being saved to the database, was not completely removed from the editing context. This caused an exception to be raised the next time the editing context was saved.

RESOLUTION:
Deletion of a newly-inserted object now completely removes the object from the editing context.

Exception logging into SQL Server 7.0 via ODBCEOAdaptor
Apple reference #2315283

ISSUE:
The ODBC adaptor shipped with WebObjects 4.0.1 did not work with version 7.0 of Microsoft's SQL Server product.

RESOLUTION:
The ODBC adaptor has been updated to work with SQL Server 7.0 as well as SQL Server 6.5.

Incorrect time zone conversion in EOAccess layer
Apple reference #2315287

ISSUE:
When converting a time value to the server time zone, the EOAccess layer substituted the sever's time zone without actually adjusting the time value for the zone difference.

RESOLUTION:
EOAttribute now performs the conversion of the time value to the corresponding value in the server's time zone.

Incorrect time zone conversion in SybaseEOAdaptor
Apple reference #2316883

ISSUE:
When converting a time value to the server's time zone, SybaseEOAdaptor only substituted the server's time zone without actually adjusting the time value for the zone difference.

RESOLUTION:
SybaseEOAdaptor now performs the conversion of the time value to the corresponding value in the server's time zone.

Special characters crash Sybase adaptor
Apple reference #2316889

ISSUE:
The SybaseEOAdaptor crashed when saving Text or BLOB data containing characters which could not be successfully encoded using the specified database encoding.

RESOLUTION:
The adaptor has been fixed to detect the encoding failure and raise an exception, so that a database encoding which is able to handle the problem characters may be specified in the connection dictionary.

OracleEOAdaptor generates incorrect SQL for left and right outer joins
Apple reference #2316963

ISSUE:
The SQL generated by the Oracle adaptor for a left outer join was actually the syntax for a right outer join, and vice versa.

RESOLUTION:
The OracleEOAdaptor now generates the correct SQL for left and right outer joins.

Some exceptions not passed across Java Bridge
Apple reference #2317188

ISSUE:
If an Objective C exception was raised in an Objective C method called from Java, the bridge correctly converted the NSException to a Java exception and threw it in Java. However, if the conversion of the NSException itself raised an exception, the subsequent behaviour of the

application was undefined.

RESOLUTION:
The conversion exception is now caught, both exceptions are logged, and a JavaUnknownError is thrown in the Java VM with the message: "Failed to convert Objective C exception to Java exception. Refer to log output for more information."

Java access violation error when bridge cannot find a class
Apple reference #2317205

ISSUE:
If a Java exception occurred while WebObjects was attempting to look up a Java class, the exception might not be re-raised in Objective C. If this occurred, the JavaBridge sometimes crashed when it failed to load the wrapper class.

RESOLUTION:
The JavaBridge now raises an appropriate exception in Objective C when a wrapper class can not be found.

Garbage collector frees wrapped objects prematurely
Apple reference #2317214

ISSUE:
When a wrapped Objective C object was created in a Java method, the Objective C proxy was not retained. Java garbage collection could then release this object while it was still in scope.

RESOLUTION:
Objective C proxy objects are now retained until the approriate autorelease pool is deallocated.

alloc or init returning nil confuses the Java bridge
Apple reference #2317215

ISSUE:
The JavaBridge did not correctly handle the case where the Objective C base of a hybrid object returned nil from its Objective C init method.

RESOLUTION:
In this case, a NullPointerException is now raised in Java. This fix included a change to one of the header files used by the bridget utility. All Java projects must be rebuilt to take advantage of this fix. Please note that your code still needs to wrap Java constructors in try/catch statements to catch instantiation exceptions; see TIL article 70035 for more details.

Case-insensitive matching sometimes fails
Apple reference #2318841

ISSUE:
Case-insensitive matching did not correctly match uppercase letters in the search pattern with lowercase letters in the receiving string.

RESOLUTION:
Case-insensitive matching now works correctly for all combinations of uppercase and lowercase comparison.

ODBC adaptor prepends owner to table name
Apple reference #2319115

ISSUE:
When reversing engineering a Microsoft SQL Server database with ODBC database, the table names all had the form OWNER.NAME instead of just NAME.

RESOLUTION:
The entity names no longer have the owner prefixed to the name.

selectObject: method return values don't match documentation
Apple reference #2319284

ISSUE:
The [EODisplayGroup selectObject:] method only returned 'NO' if it could not end editing or if the delegate refused the change. According to the class documentation, it should also return 'NO' if the EODisplayGroup's displayedObjects array does not contain a match with the method's object argument.

RESOLUTION:
As stated in the documentation, this method now returns 'NO' when it cannot find a match for the argument oject.

WebObjects applications set unnecessary cookies

Apple reference #2319507

ISSUE:
A WebObjects application could erroneously set two cookies, wosid and woinst, in the browser.

RESOLUTION:
WebObjects applications no longer set these unnecessary cookies.

Can't compile EOArchive subclasses containing JavaBeans
Apple reference #2319614

ISSUE:
An EOArchive method needed by subclasses containing JavaBeans was incorrectly declared private. This leads to a compilation error in any JavaBean-bearing EOArchive.

RESOLUTION:
This method is now declared protected.

DirectToWeb generation fails on MacOS X Server
Apple reference #2319617

ISSUE:
DirectToWeb generation on MacOS X Server can generate the following exception:

```
[DTWTemplate writeAndAddToProjectComponentNamed:]: selector not recognized
```

RESOLUTION:
This has been corrected.

OracleEOAdaptor state not reset when closing the database channel fails
Apple reference #2319664

ISSUE:
If the OracleEOAdaptor encountered an error while closing the database channel, the adaptor's state was not reset completely. As a result, the database connection could not be re-established on that channel once the database came back up.

RESOLUTION:
The OracleEOAdaptor now sets its internal state correctly before raising the error, allowing the connection to be re-established once the database is restored.

EnterpriseObjects examples Rental data contains an invalid date value
Apple reference #2324048

ISSUE:
The data with which the Rentals database is populated in the EnterpriseObjects examples contained an invalid credit card expiration date, 2597. With SQL Server 7.0, Microsoft's ODBC Driver fails to convert this date to the smalldatetime type, causing the examples' install_database script to fail and the Rentals data to be incompletely installed.

RESOLUTION:
The problem date has been changed to a value within SQL Server 7.0's valid range, 1900 to 2079.

Calls to NSLog() are very slow on Windows NT
Apple reference #2338242

ISSUE:
Calls made by an application to the NSLog() function may take as long as six seconds to return on Windows NT.

RESOLUTION:
NSLog()'s usage of the Windows API has been optimized to provide much better performance.

Raw row fetch ignores CustomQuery hint
Apple Reference #2343246

ISSUE:
In WebObjects 4.0.1, any CustomQuery hint was ignored during raw row fetches.

RESOLUTION:
The EOAccess layer now checks for a CustomQuery hint during raw row fetches and uses it if one is provided.

Applications using multiple databases may experience unexpected interactions.
Apple Reference #2343328

ISSUE:
In WebObjects 4.0.1, applications that use multiple databases could sometimes experience strange interactions due to an error in the EOAccess layer in the caching of database records.

RESLOUTION:
The EOAccess layer no longer caches database records in the manner that caused this problem, and the interaction between databases has been eliminated.

WebObjects example "FDF1040EZ" uses deprecated java.util.Date API
Apple reference #2405646

ISSUE:
The WebObjects Java example "FDF1040EZ" called deprecated java.util.Date API which returned a two-digit year. This is inconsistent with good Year 2000 programming practice.

RESOLUTION:
This example has been corrected to use the java.util.Date API correctly.

Enterprise Objects "ModelerBundle" example uses two-digit year format
Apple reference #2405647

ISSUE:
The ModelerBundler example in the Enterprise Objects Examples uses a two-digit year format for dates. This is not prefered usage for Year 2000 compliant applications.

RESOLUTION:
This example has been changed to use a four-digit year format.

WebObjects example "ElementTour" uses deprecated java.util.Date API
Apple reference #2405648

ISSUE:
The WebObjects Java example "ElementTour" called deprecated java.util.Date API which returned a two-digit year. This is inconsistent with good Year 2000 programming practice.

RESOLUTION:
This example has been corrected to use the java.util.Date API correctly.

NSTimeZone method +timeZoneForSecondsFromGMT returns incorrect results
Apple Reference #2406594

ISSUE:
The NSTimeZone method +timeZoneForSecondsFromGMT returned incorrect values in WebObjects 4.x.

RESOLUTION:
This method has been corrected.

Mapping of old time zone names and abbreviations not completely accurate.
Apple reference #2406610

ISSUE:
In the Foundation framework shipped with WebObjects 4.0.1, the mapping of old time zone names and abbreviations to the new names and abbreviations contained several errors and omissions.

RESOLUTION:
These issues have been corrected.

WOApplication raises a released exception.
Apple reference #2425076

ISSUE:
There were two places (one in WOApplication and one in WOSessionTimeOutManager) where an exception was caught, an autoreleasepool was released, and the exception was re-raised. This resulted in a message (-raise) being sent to a freed object.

RESOLUTION:

The exception is now properly retained before the pool is released, and is autoreleased before being raised again.

Corrected in WebObjects 4.0.1 Patch 1

'gnutar' command didn't accept dates later than 1999
Apple Reference #2405644

ISSUE:
The 'gnutar' command has an option to only write files newer than a given date, but version 1.11.2, the version shipped with WebObjects 4.0.1, didn't accept dates past the end of 1999, even using four-digit years.

RESOLUTION:
'gnutar' has been updated to version 1.12, which accepts dates after 1999.

WebObjects 4: Inheritance in EOModeler

One of the most commonly used elements of object-oriented design is class inheritance. The properties of a parent class may be expressed or selectively overridden in a child or subclass. The subclass is then said to "extend" the capabilities of its parent.
WebObjects and Cocoa applications are completely object-oriented. Implementing inheritance in this environment is straightforward. However, these applications frequently store and retrieve data in relational database management systems or other data sources that were not designed with object-oriented principles in mind. Thus the properties of an object model must somehow be transformed to the properties of the data storage model. The role of the Enterprise Objects Framework (EOF) is to abstract any data source and act as the transformation agent between an application's business objects and its data sources. This article is intended to describe how an object-oriented model with inheritance is implemented in EOModeler. Additional details on EOF, EOModeler and inheritance are available in the Enterprise Objects Developer's Guide and online documents.
This article has been archived and is no longer updated by Apple.

EOModeler

In a Cocoa or WebObjects application, EOModeler supports the expression of your application's model as objects and handles the details of writing a structure that EOF can use to interface with a data source. In the common case of mapping objects to relational database systems, EOModeler will:

- Map object classes to relational database tables
- Map relationships between objects to relational database joins
- Map object class inheritance to relational tables via these joins

Types of Inheritance in EOModeler

Inheritance is a powerful property in any object-oriented design, but it is still optional. First, decide whether inheritance is necessary in your implementation. Any attempt to add an object-oriented layer to non-object-oriented data sources inevitably results in a performance and complexity overhead, but by design EOF handles this transformation effectively and efficiently. EOModeler supports three types of inheritance: vertical, horizontal, and single table.

There are several considerations for selecting a type of inheritance. Each type has advantages and disadvantages. Some of the questions you should consider are:

- Are fetches directed primarily to leaf or root classes?
- How deep is the class hierarchy?
- What is the database storage cost for nulls?
- What is the likelihood of changing the model?
- Will other tools access the database?

The next three sections will concisely describe the characteristics, implementation steps, advantages and disadvantages of each EOModeler inheritance type.

Vertical Mapping

This is the most elegant of the three types, as it maps both to object-oriented concepts and to the normalized relational database structure often preferred by DBA's and data modelers. Performance issues may result from the multiple joins inherent in well normalized relational data. EOModeler represents vertically-inherited attributes in a bold oblique font in subclasses, making it easy to discern inherited properties.

Sample Output

This is an example of the SQL generated by EOModeler for an implementation of vertical mapping. The data model used in this implementation has three classes. The superclass Person has two subclasses, Employee and Customer. The SQL output was generated by the command line option -EOAdaptorSetDebugEnabled YES.

Inserting a Customer

```
SELECT UNIQUE FROM "PERSON";
INSERT INTO "Customer" ("Custacctno", "Id") VALUES ('Cust123', 1000001);
INSERT INTO "Person" ("Id", "Firstname", "Lastname", "Persontype")
VALUES (1000001, 'Fred', 'Foobar', 'C');
COMMIT;
```

Searching for an Employee with a Customer name

```
SELECT t0."Id", t0."Empno", t1."Firstname", t1."Lastname", t1."Persontype"
FROM "Person" t1, "Employee" t0
WHERE UPPER(t1."Lastname") LIKE 'FOOBAR%'
```

```
AND t0."Id" = t1."Id";
Inserting an Employee
SELECT UNIQUE FROM "PERSON";
INSERT INTO "Employee" ("Empno", "Id")
VALUES ('EmpNo1234', 1000002);
INSERT INTO "Person" ("Id", "Firstname", "Lastname", "Persontype")
VALUES (1000002, 'Johnny B.', 'Goode', 'E');
COMMIT;
```

Selecting a Person (Person.lastName = 'Foobar')

```
SELECT t0."Id", t0."Custacctno", t1."Firstname", t1."Lastname",

t0."Persontype" FROM "Person" t1, "Customer" t0 WHERE UPPER(t1."Lastname")
LIKE 'FOOBAR%' AND t0."Id" = t1."Id";
SELECT t0."Id", t0."Empno", t1."Firstname", t1."Lastname", t0."Persontype"
FROM "Person" t1, "Employee" t0 WHERE UPPER(t1."Lastname") LIKE 'FOOBAR%' AND
t0."Id" = t1."Id";
SELECT t0."Id", t0."Firstname", t0."Lastname" FROM "Person" t0 WHERE
UPPER(t0."Lastname") LIKE 'FOOBAR%';
```

Characteristics

- Each entity class has its own database table
- The model directly reflects the class hierarchy
- Superclass data will be fetched with subclass fetch
- Relational joins resolve inheritance relationships

Implementation

- Create a superclass entity with superclass attributes only
- Create subclass entities with subclass-specific attributes
- The superclass and all subclasses need a stored primary key
- Create to-one relationships from the subclasses joining on primary keys; do not set them as class attributes
- Flatten the superclass attributes into subclasses
- Set the attributes as class properties if they are class properties in superclass
- EOModeler displays attributes in bold oblique style
- Flatten superclass relationships into each subclass and set them as a class property per the superclass property
- Set superclass relationships as class properties if they are class properties in the superclass
- Set the superclass as the parent of the subclasses in the Advanced Entity Inspector
- Attributes defined in the parent appear italicized in the subclass's attribute list
- Derived attributes must have table columns
- Set the superclass as abstract if it is never instantiated
- If the superclass needs persistent storage for its attributes, then this class must have a table

Advantages

- Add subclasses at any time without affecting other parts of model
- Clean, normalized database schema
- Most closely resembles normal object-oriented inheritance

Disadvantages

- Least efficient performance
- Particularly slow for deep hierarchies and fetching from superclass

Horizontal Mapping

This is perhaps the most balanced of the three types. It provides enforcement of superclass attributes in subclasses similar to that of abstract classes or Java interfaces, but has much less performance overhead. As with vertical inheritance, EOModeler represents horizontally-inherited attributes distinctly; they are shown in a plain oblique font in subclasses.

Sample output

This is an example of the SQL generated by an implementation of horizontal inheritance. the data model used in this implementation has three classes. The superclass Person has two subclasses, Employee and Customer. The SQL output was generated by the command line option -EOAdaptorSetDebugEnabled YES.

Inserting a Customer

```
SELECT UNIQUE FROM "PERSON";
INSERT INTO "Customer" ("Persontype", "Custacctno", "Firstname", "Lastname", "Id")
VALUES ('C', 'cust2323', 'Sherlock', 'Holmes', 1000001);
COMMIT;
```

Querying for a Person (Person.personType = 'C')

This example is a bit different. A type attribute for the subclass could be added either to the superclass or the subclass. If it is added to the superclass, a person who is both an employee and a customer would be represented twice in the database. If it is added to the subclass, the person would only be in the database once. In this case, additional care must be taken so that there is no redundant information between the subclasses.

```
SELECT t0."Custacctno", t0."Firstname", t0."Lastname", t0."Id",
t0."Persontype" FROM "Customer" t0 WHERE (t0."Persontype" = 'C' AND
UPPER(t0."Persontype") LIKE 'C%');
SELECT t0."Empno", t0."Firstname", t0."Lastname", t0."Personid",
t0."Persontype" FROM "Employee" t0 WHERE (t0."Persontype" = 'E' AND
UPPER(t0."Persontype") LIKE 'C%');
SELECT t0."Personid" FROM "Person" t0 WHERE UPPER(t0."Persontype") LIKE 'C%';
```

Characteristics

- Subclasses contain all class-specific attributes, plus all superclass attributes
- The superclass can be abstract or concrete
- The superclass must have a database table if it is instantiated
- The superclass is specified as the parent entity in Advanced Entity Inspector
- The superclass acts as an abstract class specification

Implementation

- Create a superclass entity with superclass attributes
- Create subclass entities with all superclass and subclass-specific attributes
- EOModeler displays attributes in oblique style
- Set the superclass as parent of the subclasses
- Set the parent as abstract if it is never instantiated
- Flattening is not required

Advantages

- No joins required for fetch since all parent attributes are in subclass table
- More efficient than vertical mapping for deep hierarchies
- Best if only subclass fetches are required

Disadvantages

- New parent attributes must be added to every subclass
- Frequency of table changes must be balanced against frequency of fetches

Single Table Mapping

This is perhaps the easiest of the three types. It inherently enforces superclass attributes in subclasses, but has little or no performance or maintenance overhead. But it also is the least elegant solution from a data modeling and normalization perspective.

Characteristics

- All superclass attributes and all attributes of all subclasses are combined in one table
- Nulls are assigned for attributes not in a particular subclass object
- Use a class attribute for a subclass type identifier

Implementation

- Create a superclass entity and all subclass entities
- Add a type attribute to distinguish the subclasses
- In the Advanced Entity Inspector, set the superclass as parent to the subclasses
- In the Advanced Entity Inspector, create qualifiers in each of the subclasses to fetch only objects of that subclass
- The superclass may be abstract if it is never instantiated

Advantages

- Superclass objects retrieved with single fetch
- Model changes are only made on one entity

Disadvantages

- Every row in database contains columns for all subclasses' attributes
- Depending on database's null storage this can consume a lot of space
- Limitations on number of database columns can preclude using this inheritance type

WebObjects: Preventing Security Holes with Dynamic Content

On February 2, 2000, the CERT coordination center issued a security advisory entitled "CERT® Advisory CA-2000-02: Malicious HTML Tags Embedded in Client Web Requests". The alert concerns web sites which generate dynamic content. This article discusses the impact of this advisory on web sites built with WebObjects.
This article has been archived and is no longer updated by Apple.

About Dynamic Content Security

The issue described in the CERT advisory concerns sites which generate dynamic content from user input; for example, web discussion boards and guestbooks. Attackers can embed tags in this input, such as SCRIPT or FORM tags, that can run scripts on a client's system or compromise the security of their information. This can cause security issues even if the page is only visible by the user who appears to have given the input; attackers can include poisoned URLs in email or newsgroup messages or on other web sites. In some cases, the attacks can be made persistent with cookies.

All dynamic content providers need to be aware of this serious issue. All WebObjects developers should read the original CERT advisory, which can be found at: http://www.cert.org/advisories/CA-2000-02.html

WebObjects and Dynamic Content

By default, when an NSString is used to create a dynamic page, WebObjects escapes all special characters, including the "<" and ">" characters. For example, if a user input the following HTML code into a WebObjects application:

```
Hello message board. This is a message.
<SCRIPT>malicious code</SCRIPT>
This is the end of my message.
```

WebObjects, when dynamically building a page with this input, would generate:

```
Hello message board. This is a message.
&lt;SCRIPT&gt;malicious code&lt;/SCRIPT&gt;
This is the end of my message.
```

This will prevent the malicious code from executing.

However, WebObjects allows developers great flexibility, and some developers may have chosen to change this default behavior to allow users to enter valid HTML tags. If you have chosen to allow HTML tags in user input, your application will be vulnerable to this issue. In addition, static pages generated by your web server, such as the "404 Not Found" page, may be vulnerable to malicious tags. Contact your web server vendor for more information.

WebObjects: Using Fingerprint Files

This document describes how to use .fingerprint files and the checkpatchinstall script on Solaris or HP-UX to determine which WebObjects patch has been installed on your system for versions up to and including WebObjects 4.5. For more information on WebObjects patches and what they do, see the WebObjects Current Update List, Knowledge Base document 70037. To find the patch level of a Mac OS X (Server) or Windows WebObjects installation or a Solaris or HP-UX installation of WebObjects 4.5.1 or later, see Knowledge Base document 70074.

Related Documents

70037 WebObjects Current Patch List

70074 WebObjects: How to Determine the Installed WebObjects Version

This article has been archived and is no longer updated by Apple.

Downloading the Script and Fingerprint Files

To check your patch installation, first download the **checkpatchinstall.pdo.csh** script from Apple's FTP servers. You will also need to download the fingerprint file from the appropriate patch version. Follow the links below to download the fingerprint file:

Solaris Files

WebObjects 4.5 Update 3 for Solaris

WebObjects 4.5 Update 2 for Solaris

WebObjects 4.0.1 Patch 3 for Solaris

WebObjects 4.0.1 Patch 2 for Solaris

WebObjects 3.5.1 Patch 4 for Solaris

WebObjects 3.1 Patch 1 for Solaris

HP-UX Files

WebObjects 4.5 Update 3 for HP-UX

WebObjects 4.5 Update 2 for HP-UX

WebObjects 4.0.1 Patch 2 for HP-UX

WebObjects 3.5.1 Patch 4 for HP-UX

WebObjects 3.1 Patch 1 for HP-UX

Using the Script and Fingerprint Files

The syntax for the checkpatchinstall script is:

```
checkpatchinstall.pdo.csh <fingerprintfile>
```

The script will then report whether the patch represented by the fingerprint file is installed on the system.

WebObjects 4.5: Setting Java VM Command-Line Options

This document discusses methods for configuring the Java Virtual Machine under WebObjects 4.5. For information on using Java under WebObjects 3.5.1, please see the **WebObjects 3.5.1 Java Bridge Troubleshooting Guide**.

This article has been archived and is no longer updated by Apple.
Q: How do I pass command-line arguments to the Java VM? I need to increase the garbage heap size, so that my application doesn't run out memory.

A: WebObjects 4 introduces a new way to specify arguments to the Java VM. The following arguments may be specified. Those ending in "Size" or "Port" take number arguments; all others take YES or NO.

- NSJavaCheckSource (equivalent to -cs or -checksource)
- NSJavaNativeStackSize (equivalent to -ss<number>)
- NSJavaStackSize (equivalent to -oss<number>)
- NSJavaMinHeapSize (equivalent to -ms<number>)
- NSJavaMaxHeapSize (equivalent to -mx<number>)
- NSJavaVerifyMode (equivalent to -verify)
- NSJavaEnableClassGC (NO is equivalent to -noclassgc)
- NSJavaEnableVerboseGC (equivalent to -verbosegc)
- NSJavaDisableAsyncGC (equivalent to -noasyncgc)
- NSJavaVerbose (equivalent to -v or -verbose)
- NSJavaDebugging (equivalent to -debug)
- NSJavaDebugPort

There are three ways to set these arguments:

1) Use the defaults command-line tool:
```
defaults write myapp NSJavaMinHeapSize 33554432
```
2) Pass them on the command line:
```
MyApp.woa/MyApp -NSJavaMinHeapSize 33554432
```
3) Set them programatically. Refer to the documentation for **NSUserDefaults** (Objective C) or **com.apple.yellow.foundation.NSUserDefaults** (Java).

PowerBook/iBook: No Issues Caused By Airport Security Scanners

Airport X-ray security scanners do not cause any issues with iBook and PowerBook computers.
This article has been archived and is no longer updated by Apple.
Airport X-ray security scanners do not cause any issues with iBook and PowerBook computers.

The American Society for Testing and Materials (ASTM) conducted a study on X-ray induced issues to memory devices, including audio and video tapes and floppy disks, and found that these devices have enough shielding to protect the media.

The study found that the magnetic field was actually strongest around the security monitor, which most computers never even come close to. They taped a disk to the monitor for several hours without harm. A committee member suggested that it would take at least 1000 million passes through the X-ray machine before any issues would be evident.

WebObjects 3.5.1 Administration FAQ

This article contains frequently asked questions (FAQ) regarding WebObjects 3.5.1 installation and administration, with answers to those questions.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. What databases/adaptors are supported by WebObjects Enterprise 3.5.1?
2. How do I configure Microsoft IIS for WebObjects?
3. I've read all the Release Notes and still can't get WebObjects installed and running!

Question 1: What databases/adaptors are supported by WebObjects Enterprise 3.5.1?

Answer: Apple provides Sybase, Oracle and generic ODBC adaptors for WebObjects on most platforms. Third-party adaptors may be available for other databases, including Informix, Quickbase, AS/400, Supra, DB2, Gupta SQL Base, VSAM, ADABAS, IMS/DB, and NCR Teradata. Other databases may be accessed programmatically through custom libraries provided by your database vendor.

Question 2: How do I configure Microsoft IIS for WebObjects?

Answer: This bug concerns Microsoft IIS Server running on Windows NT Server (Microsoft IIS Server does not currently run on Windows NT Workstation). On Windows NT Server, if you install WebObjects 3.1 or 3.5.1 under a **C:\\NeXT** directory, the cgi adaptor won't autostart your applications correctly. The IIS Server creates subprocesses with a special user that has no privilege at all, and that has no access to the NEXT_ROOT environment variable. An autostarted application won't have any privilege either, and won't be able to locate WebObjects resources (for example TimeZone files).

First:

- Install WebObjects under the root directory. When the installer asks you for a directory name to be the root of all Apple Enterprise software, set it to the root directory of a drive (such as **C:**).
- When asked for your **cgi-bin** directory, you should enter the path of the **Scripts** directory.

After installation:

- In the **Scripts** directory rename **WebObjects** to **WebObjects.exe**
- In **C:\\NextLibrary\\WebObjects\\Executables**, make a copy of **DefaultApp** and name the copy **DefaultApp.exe**. (You need to have both **DefaultApp** and **DefaultApp.exe** in that directory.)

Then, either:

- Run the Internet Service Manager application, bring up the Server Properties panel, and change the Anonymous Logon Username and Password to a user with administrator privileges. This will allow you to autostart web applications from the browser.

Or:

- Start your web applications by hand.

Also, if you're using the IIS Server, the URL to your WebObjects application should contain **/Scripts/WebObjects.exe** instead of **/cgi-bin/WebObjects**, as the **cgi-bin** directory is actually called **Scripts**. For example,
`http://server/Scripts/WebObjects.exe/Examples/HelloWorld` is the right way to invoke the HelloWorld application.

Question 3: I've read all the Release Notes and still can't get WebObjects installed and running!

Answer: It seems that on some systems the **/tmp** or **C:\\TEMP** directories either don't exist or don't have read/write permissions set correctly. Be sure the directory can been seen and accessed by all. WebObjects, other apps and users need access to this directory to work properly.

EOF 2.2 Release Notes

This document contains the release notes for release 2.2 of Enterprise Objects Framework, included with release 3.5 of WebObjects.
This article has been archived and is no longer updated by Apple.
The Windows version of this release can be used to develop software for Intel machines running Windows NT. The MachOS version of this release is 3-way fat; it can be used to develop software for NeXT, Intel, and SPARC. The PDO version of this release can be used to develop software for Solaris and HPUX. None of the versions have been qualified for OpenStep application development.

Note that the installation of WebObjects 3.5 replaces your existing OpenStep installation with new development tools, frameworks, and files. For example, there are modifications to ProjectBuilder, makefiles, and project types to accomodate new features in WebObjects. Interface Builder and the AppKit framework are installed with WebObjects 3.5, but have not updated from the OPENSTEP 4.2 release. While we don't believe there are issues developing OpenStep applications on a WebObjects 3.5 system, you will not receive support related to issues you encounter while developing OpenStep-based applications. If you need to develop OpenStep applications on a supported platform, use a machine that does not have WebObjects 3.5 installed.

These release notes are organized into the following sections:

- Information About Other Releases
- Notes specific to Windows NT Developers
- Notes specific to PDO Developers
- Database Client Libraries
- New Features in Release 2.2
- Locating the Documentation for this Release
- Installing the Examples
- Known Issues in Release 2.2
- Enterprise Objects Framework User Defaults

Note: Because release 2.0 of Enterprise Objects Framework and later releases are based on the same architecture, many of the subjects in this document are relevant to all 2.x releases. Consequently, the term "release 2.x" is used where a discussion applies equally to releases 2.0 and higher.

Information About Other Releases

This document describes the features introduced, the bugs fixed, and the known issues in Enterprise Objects Framework release 2.2.

For a description of the features introduced in Enterprise Objects Framework release 2.0, see the 2.0 release notes. They contain a lot of information that's still relevant for 2.2, including information about converting release 1.x applications to 2.0 and a list of features shared with Enterprise Objects Framework release 1.2.

For a description of how Enterprise Objects Framework 2.x differs from the preceding releases, see the document Differences Between Enterprise Objects Framework 1x and 2.0 in /NextLibrary/Documentation/NextDev/EnterpriseObjects/1x_To_2.

Notes Specific to Windows NT Developers

References to filenames in this document use UNIX format. On Windows NT, you can interpret these by reading backslashes for the slashes and adding the installation directory (c:\\NeXT\\ by default) to the beginning. For example, /NextLibrary/Documentation on Windows NT is c:\\NeXT\\NextLibrary\\Documentation

To use Enterprise Objects Framework on Windows NT, you must have the appropriate database client libraries. The Sybase client libraries are provided on the WebObjects Enterprise 4.2 CD as an optional package. To install the Sybase client libraries, you must do a custom installation and explicitly specify that you want to install the package. To use Enterprise Objects Framework with Oracle or Informix, you must purchase the appropriate client libraries from your database vendor.

Here's what you need:

Oracle

Phone: (800) 542-1170 or call your local sales representative

Ask for: SQLNET v2.2 for PC/Windows NT

The Oracle adaptor on NT requires the Oracle 8.0, 7.3, or 7.2 Client Library. It won't work with the 7.1 libraries.

Informix

Phone: (800) 331-1763 or call your local sales representative

Ask for: ESQL/C version 7.2 for Win32

Notes Specific to PDO Developers

To use Enterprise Objects Framework on PDO, you must have the appropriate database client libraries.

Here's what you need:

Oracle

Phone: (800) 542-1170 or call your local sales representative

Ask for: 7.3.2 SQLNet V2 TCP/IP Client libraries

Informix

Phone: (800) 331-1763 or call your local sales representative

Ask for: ESQL/C Version 7.20.UC2

Sybase

Phone: (800) 685-8225 or call your local sales representative

Ask for: OpenClient/C Version 11.1

On PDO applications must explicitly link against the adaptor framework and the client libraries. New makefiles look for adaptor frameworks and automatically add in the right linker arguments. Simply add the adaptor framework to your project, and set the requisite environment variable specifying where the client libraries are installed. For Oracle set ORACLE_HOME and optionally ORACLE_REL. (The ORACLE_REL flag controls which set of libraries are used. It uses the Oracle 7.3 static link libraries by default, but you can also specify "8.0-static" or "7.3-dynamic.") For Sybase set SYBASE_HOME. For Informix set INFORMIX_HOME.

If you use dynamic libraries on Solaris, you need to set the LD_LIBRARY_PATH environment variable when running your application.

Database Client Libraries

This section includes some tips on using database client libraries with Enterprise Objects Frameworks. It is organized by database vendor.

Oracle

On Windows NT, using the latest release of the client library (7.3) requires you to use SQL*Net v2, which requires a tnsnames.ora file. tnsnames.ora is a file that you put on client machines, generally in the directory Orant/Network/Admin. The file contains information needed to connect to a server over the network. Entries in tnsnames.ora are keyed off of a server ID alias, and they include information such as the server ID, the host machine name, and the network protocol used by the client library to resolve the server ID alias. An entry in tnsnames.ora might resemble the following:

myServerAlias = (DESCRIPTION=(ADDRESS=(PROTOCOL=tcp)

(HOST=myMachine) (PORT=1521))(CONNECT_DATA=(SID=eof)))

Oracle provides tools you can use to create tnsnames.ora files. Refer to your Oracle documentation for more information on tnsnames.ora files and the tools you can use to create them.

If you're using the 7.2 version of the Oracle client libraries on Windows NT or if you're using Mach clients, you can use either SQL*Net v1 or SQL*Net v2. To use SQL*Net v1, you should set your adaptor's connectionDictionary serverId entry to "T:<host-machine>:<server-name>".

To use SQL*Net V2 on Mach clients, you should create a tnsnames.ora file and put it in the /etc directory.

Informix

If you get the error "INFORMIXSERVER not in sqlhosts file (25596)" but can connect to your database server using the Informix ilogin program, you may need to run SetNet32 to update the environment variables used by Informix.

The Informix client libraries appear to have redundant sources of server information. They use the sqlhosts file ($INFORMIXDIR/etc/sqlhosts) as well as a collection of environment variables managed by the Setnet32 program.

See your Informix documentation for more information on the sqlhosts file and the Setnet32 program.

New Features for 2.2

Java-wrapped Access and Control Layers

EOF 2.2 includes:

- Java-wrapped versions of the EOAccess and EOControl frameworks, so that you can write your Enterprise Object classes and Enterprise Objects Framework code in Java.
- A Java class browser demo application for browsing Java APIs, available in NextDemos/JavaBrowser.app.

EOModeler

- EOModeler can generate template code for Java enterprise object classes.
- Reverse engineering incorporates more schema information from your database into newly created models.

Framework

EOF 2.2 provides:

- Caching of to-many array faults that greatly reduces faulting (especially in WebObjects applications), thereby improving performance.
- A new insensitive like qualifier.

Locating the Documentation for this Release

The documentation for this release is provided in HTML and PDF formats. You can locate and view the documentation using the WebObjects Home Page. On NT, click the Start button and choose WOHomePage in the WebObjects program group. Or open the home page in a web browser directly, using the file <DocRoot>/WebObjects/Documentation/WOHomePage.html.

In addition to the documentation listed in the home page, this release also includes the document Differences Between Enterprise Objects Framework 1x and 2.0 on-line, which describes how the product has changed between the 1x and 2.0 releases. It is located in the directory: /NextLibrary/Documentation/NextDev/EnterpriseObjects/1x_To_2.

Issues with Reading PDF Files

If you're using the Acrobat Reader to view PDF files on Windows NT, some text may initially appear as gray lines. If this happens, you can fix it by choosing File -> Preferences -> General. In the General Preferences panel, uncheck the Greek Text option.

Documentation Feedback

Your comments on our documentation are especially valuable. Please send electronic mail with your comments and suggestions to techpubsfeedback@group.apple.com.

Installing the Examples

This release provides on-line examples to help familiarize you with Enterprise Objects Framework 2.x. These examples are located in /NextDeveloper/Examples/EnterpriseObjects. For more information on installing and building the examples, see the ExamplesGuide within the examples directory or refer to Post Installation Instructions, which is accessible from the WebObjects Home Page.

Known Issues in Release 2.2

This section describes known issues with release 2.2 of Enterprise Objects Framework. It is organized into the following sections:

- Java-wrapped Access and Control Layers
- Access Layer
- Control Layer
- Miscellaneous Framework
- Informix Adaptor
- ODBC Adaptor
- Oracle Adaptor
- Sybase Adaptor
- EOModeler
- On-line Examples
- Documentation

Java-wrapped Access and Control Layers

These issues exist in the Java-wrapped versions of the Access and Control layers of this Enterprise Objects Framework release:

Reference: 81432

Issue: Key-value coding invocations raise if the provided key is different in Java from what it is in Objective-C.

Description: If you use key-value coding to invoke a method whose name is different in Java from what it is in Objective-C (for example, ImmutableVector.size is mapped to [NSArray count]), the key is unbound on the Objective-C side and an exception is raised.

Workaround: In key-value coding invocations, use the Objective-C keys instead of their Java counterparts.

Reference: 81711

Issue: **valueForKey** raises an unbound key exception if the Objective-C method corresponding to the provided key returns **void**.

Workaround: If you're writing Objective-C code that you're going to bridge, write Objective-C methods that return a value (instead of **void**).

Access Layer

These issues exist in the access layer of this Enterprise Objects Framework release:

Reference: 81863

Issue: There isn't a publicly available method to turn off to-many array fault caching.

Workaround: If you need to turn off to-many array fault caching for any reason (if you've implemented your own solution, for example), invoke the following method before the creation of any instances of EODatabase or EODatabaseContext. Calling it from main() would be good.

[EODatabaseContext _setUseToManyCaching:NO];

Reference: 82008

Issue: NSNumber with value 0 is still taken to be NULL for primary key.

Description: Starting in EOF 2.2, the EODatabaseContext assumes that an object with a single attribute primary key with a value of zero must be a newly created instance. And as such, the database context will attempt to get a new primary key for the object via delegate hook or the adaptor-specific primary key generation mechanism. This change allows users to use scalar data types (such as int) as an enterprise object's primary key, and still rely on EOF automatic primary key generation.

Unfortunately, if you have an existing database containing rows that have a primary key of 0, an attempt to update an object created from such a row will cause the database context to incorrectly assume that an object created from such a row needs to get a new primary key. This can leave invalid foreign key references in other tables.

Workaround: Implement the EODatabaseContext delegate method databaseContext:newPrimaryKeyForObject:entity: to catch the case where the framework is going to mistakenly get a new key.

From EODatabaseContext.h:

```
- (NSDictionary *)databaseContext:(EODatabaseContext *)context

   newPrimaryKeyForObject:(id)object

   entity:(EOEntity *)entity;

   // If a newly inserted EO doesn't already have have a primary key set,

   // this delegate is called to generate a key.  If the delegate is not implemented,

   // or returns nil, then the DatabaseContext will call

   // [EOAdaptorChannel primaryKeyForNewRowWithEntity:(EOEntity *)entity]

   // to attempt to generate the key.
```

Example of how to get the database context and set its delegate:

```
{

...

   model = [[EOModelGroup defaultGroup] modelNamed:@"myModel"];

   dbContext = [EODatabaseContext

       registeredDatabaseContextForModel:model
```

```
        editingContext:editingContext];

    [dbContext setDelegate:self];

...

}
```

Example of a delegate method implementation:

```
- (NSDictionary *)databaseContext:(EODatabaseContext *)context

    newPrimaryKeyForObject:(id)object

    entity:(EOEntity *)entity

{

    if (entity == entityThatIKnowHasAValidRowWithAKeyOfZero)

        if ([[object valueForKey:primaryKeyThatCanBeZero] isEqual:[NSNumber zero]])

            return [NSNumber zero];

    return nil;

}
```

Reference: 77721

Issue: Can't update rows containing string attributes with trailing spaces.

Description: The Enterprise Objects Framework adaptors automatically strip trailing spaces from string values fetched from the database. They also strip spaces on newly inserted strings before sending them to the database. This works fine until you fetch data that a non-Enterprise Objects Framework application inserted that contains trailing spaces. If that attribute is marked as "used for locking," Enterprise Objects Framework will be unable to update the row (because the version in the database is different from the space-stripped version in the snapshot).

Workaround: Do not mark columns that could contain trailing spaces as used for locking. Alternately, strip the spaces from the data in your server.

Reference: 77546

Issue: Inclusion of framework models in defaultModelGroup doesn't happen automatically on PDO.

Description: Applications on PDO that link with frameworks that include models don't automatically get the models put in the applications.

Workaround: Manually construct the the model group yourself at application initialization. For example:

```
EOModelGroup *group = [EOModelGroup new];

        // repeat for each model containing framework used by app

NSBundle *bundle = [NSBundle bundleForClass:[SomeClassInFramework class]]

NSEnumerator *enumerator = [[bundle pathsForResourcesOfType:@"eomodeld"  inDirectory:nil] objectEnumerator];

NSString *modelPath;

while (modelPath = [enumerator nextObject])

    [group addModelWithFile:modelPath];

[EOModelGroup setDefaultGroup:group];

[group release];
```

Reference: 77631

Issue: If you're editing a model (in code or with EOModeler), sometimes an EORelationship will return nil from inverseRelationship, even though you just added the inverse relationship.

Description: The first time you ask an EORelationship for its inverse relationship, it searches all the relationships in its destinationEntity looking for an inverse. It caches the result of this search, and this cache does not always get invalidated when the relationships of the destinationEntity change.

Workaround: See the category on EORelationship in the ModelerBundle/RelationshipExtras.m example.

Reference: 77354

Issue: Issues saving changes to attributes with mutable custom value objects.

Description: Suppose you have a mutable custom value type, PhoneNumber, that implements methods such as setAreaCode: and setPrefix: to change an enterprise object's values. If you use such methods to modify an enterprise object's values and save changes, the enterprise object is not saved to the database.

Workaround: To use mutable value classes you must do three things:

1. In the PhoneNumber value class object, implement isEqual: to appropriately compare two instances.
2. If the PhoneNumber value is about to be modified, its owning enterprise object must invoke [self willChange] before the modification.
3. In your enterprise object class, you must implement a "set" method that copies rather than retains the object passed to it. For example:

```
- (void)setDayTimePhone:(PhoneNumber *)number {

[dayTimePhone autorelease]

dayTimePhone = [number copy];

}
```

#1 would be required, even in a perfect world. #2 is a requirement of the basic Enterprise Objects Framework architecture. #3 is a bug in Enterprise Objects Framework -- Enterprise Objects Framework should be passing enterprise objects a copy of their values, but instead it's passing the the same instance that's shared in the snapshot.

In general, the simplest workaround is to use immutable custom value objects.

Reference: 72619

Issue: EOAdaptorChannel does not inherit EOAdaptor's delegate.

Description: According to the EOAdaptorChannel class specification and header file, the EOAdaptorChannel's delegate should automatically be kept in synch with its adaptor. Indeed, if a new delegate is assigned to an EOAdaptor, the new delegate is propagated to any of that adaptor's existing contexts and channels. However, if you create an EOAdaptor, assign a delegate to it, and then create EOAdaptorContexts and EOAdaptorChannels, the newly-created contexts and channels don't have the delegate assigned to them.

Workaround: Wait until all of the channels and contexts are instantiated before assigning the adaptor's delegate, or reassign the adaptor's delegate each time a new channel or context is created.

Reference: 61475

Issue: Enterprise Objects Framework performs less efficient deep fetches for single-table inheritance mappings than it should.

Description: To perform a deep fetch, Enterprise Objects Framework performs a fetch for each concrete class in an inheritance hierarchy. For a single-table inheritance mapping, Enterprise Objects Framework should perform only one fetch and then sort the results in memory. For example, if Person, Employee, and Customer objects are stored in one table<the PERSON table<the Framework should perform one fetch on the PERSON table to fulfill a deep fetch request of Person, Employee, and Customer objects. Instead, it performs three fetches: one to get Person objects, one to get Employee objects, and another to get Customer objects.

Workaround: Define only one entity for the entire inheritance hierarchy, and use the EOModelGroup delegate methods subEntityForEntity:primaryKey:isFinal:, and entity:classForObjectWithGlobalID: to create instances of the proper subclasses from database rows.

Reference: 74251

Issue: Changes made during saveChanges are silently lost.

Description: If you change an enterprise object while its editing context is in its saveChanges method (for example, if you change an enterprise object in an EODatabaseContext delegate method), the changes may be silently lost.

Workaround: Don't make changes to objects during the save process. Instead, make the changes from the EOEditingContext delegate method editingContextWillSaveChanges:.

Reference: 74345

Issue: You can't update to-many relationship if the foreign key isn't marked as a class property or as used for locking.

Description: Suppose that an entity's foreign key attribute isn't marked as a class property or as used for locking. If you designate the foreign key attribute as a to-many relationship's destination key, the foreign key value isn't always updated. This occurs because the destination entity doesn't know that the attribute participates in a relationship. Therefore, the destination entity doesn't fetch the foreign key from the database or update it.

Workaround: Mark attributes that are destination keys of a to-many relationship so they are fetched. For example, you could:

- Mark them as class properties.
- Mark them as used for locking.
- Use them in inverse relationships to the problematic to-many's source entity.

Reference: 74379

Issue: EODatabaseContext can't be the direct parentObjectStore of an EOEditingContext.

Description: The EODatabaseContext requires that an EOObjectStoreCoordinator sit between it and any EOEditingContexts that it serves. This is the default configuration set up by the framework, so you shouldn't normally run into this issue. Just a reminder, you can set up an editingContext and be ready to go with this one line:

```
EOEditingContext *editingContext = [EOEditingContext new];

// automatically uses [EOObjectStoreCoordinator defaultCoordinator]

// as parentObjectStore
```

Any necessary EODatabaseContexts are created and registered automatically.

Workaround: Don't assign an EODatabaseContext as the parentObjectStore of an EOEditingContext. There's no benefit to doing so anyway.

Reference: 76526

Issue: Applying a qualifier with key path to top of horizontally mapped inheritance hierarchy generates invalid SQL.

Description: Enterprise Objects Framework's query building mechanism doesn't handle relationships to inheritance hierarchies. For example, suppose that you are are attempting to qualify a fetch through a to-many relationship (planes) that points to the top of a horizontally mapped inheritance hierarchy (for the entities Plane, FighterPlane, and TrainerPlane). If you want the query to test against all tables, you'd expect Enterprise Objects Framework to generate SQL similar to the following:

```
SELECT  t0.AIRPORT_ID

FROM PLANE t1, FIGHTER t2, TRAINER t3, AIRPORT t0

WHERE

(t1.LENGTH <= 1000 AND t0.AIRPORT_ID  = t1.AIRPORT_FK) OR

(t2.LENGTH <= 1000 AND t0.AIRPORT_ID  = t1.AIRPORT_FK) OR

(t3.LENGTH <= 1000 AND t0.AIRPORT_ID  = t1.AIRPORT_FK)
```

Instead, Enterprise Objects Framework generates the following SQL:

```
SELECT  t0.AIRPORT_ID

FROM PLANE t1, AIRPORT t0

WHERE

(t1.LENGTH <= 1000) AND

t0.AIRPORT_ID = t1.AIRPORT_FK
```

In other words, only the table for the root of the hierarchy is queried.

Workaround: You can create a qualifier that generates the correct SQL by:

1. Adding relationships in the source entity to all the tables in the inheritance hierarchy. For example, to the Airport entity, you'd add the

relationships toFighters and toTrainers to the destination entities FighterPlane and TrainerPlane, respectively. Mark the relationships so they aren't class properties.

2. When building your query, explicitly list these extra relationships. In the Planes example, you'd fetch from Airport where "planes.length < 1000 OR toFigtherPlanes.length < 1000 OR toTrainerPlanes.length < 1000"

Alternatively, you might be able to solve this issue more generally by writing a post processor for EOQualifiers that splits up clauses that perform inheritance tests. The post processor could even programmatically generate the additional relationships on demand and register them with the model using names like "plane_Subclass_Fighter".

A generic EOQualifier post processor could be wired into Enterprise Objects Framework so that application writers don't have to know it exists. The right place for such a mechanism is probably in EOKeyValueQualifier's schemaBasedQualifierWithRootEntity: method (see EOSQLQualifier.h). You could put the post processor code in a subclass of EOKeyValueQualifier (with an appropriate call to super after the transformation, if any, is performed) and have your subclass pose as EOKeyValueQualifier.

Reference: 47832

Issue: Enterprise Objects Framework can't update attributes whose internal types are custom (such as NSImages).

Description: A custom value class must implement isEqual: to be used for attributes marked as used for locking.

Workaround: Implement isEqual: in the custom value class or don't mark the attribute as used for locking.

Reference: 65078

Issue: Seemingly innocuous qualified fetch always causes exception.

Description: Some qualified fetches raise exceptions because values in the SQL have been formatted as strings when they should have been formatted as some other type. This can happen when you enter an invalid external type or when a Sybase model doesn't contain information about user-defined types that are used in the model.

Workaround: In the case of an invalid external type, simply correct it. In the case of a user defined type, create a new model by reverse engineering the database. The new model's connection dictionary contains information about user-defined types. Copy the connection dictionary from the new model to the original one.

Reference: 69039

Issue: Alert panel displaying adaptor error is never dismissed.

Description: This occurs whenever an adaptor operation that was invoked from an awakeFromNib: method displays an alert panel. The issue is that the entire object graph is not yet instantiated when awakeFromNib: is invoked.

Workaround: Database operations should be begun from the applicationDidFinishLaunching: method rather than the awakeFromNib: method. Of course, this means that any methods that indirectly cause database communication should also be invoked from the applicationDidFinishLaunching: method.

Reference: 76885

Issue: The set of valid values for the databaseEncoding entry of a connection dictionary are not documented, and the set can vary in different locales.

Description: A connection dictionary's databaseEncoding entry contains the localized name for the string encoding. The localized names are not documented. Furthermore, the localized names for string encodings can vary with the user's locale. Consequently, the specified encoding for an application might not work for users in different locales.

Workaround: You can find the localized name for string encodings in /NextLibrary/Frameworks/Foundation.framework/Resources/language.lproj/EncodingNames.strings.

Reference: 59472

Issue: Derived attributes are limited and don't offer full SQL as advertised.

Description: Placing a string or a numeric constant in the definition field of a derived attribute generates invalid SQL. Definitions such as Âªtitle Âº and Âª0.0Âº don't work correctly. However, definitions such as Âªatt1 + 5Âº should work correctly when Âªatt1Âº specifies another attribute.

Workaround: None.

Reference: 70049

Issue: EOModelGroup doesn't raise an exception when more than one entity has the same name.

Description: Although it is illegal to have the same entity name in two different models in a model group, EOModelGroup doesn't check to see if this is the case when adding a model.

Workaround: Manually verify that no two models have entities with the same name or write a method to perform the check.

Reference: 70260

Issue: Some error messages returned by the Framework's default validation methods (such as methods that check that a value doesn't exceed the maximum width specified in its attribute) aren't localized.

Workaround: Implement an exception handler for use with the EOEditingContext, and have the handler replace the error messages with localized strings.

Reference: 76152

Issue: Inserting and deleting objects involved in inverse, to-many relationships can be very slow.

Description: Suppose that a ServiceRequest has a to-one relationship to its CustomerServiceRepresentative, and that the CustomerServiceRepresentative has an inverse to-many relationship to its ServiceRequests. When you assign a request to a representative using addObject:toBothSidesOfRelationshipWithKey:, you fire the fault for the CustomerServiceRepresentative.serviceRequests. So, if a representative has a large number of requests, assigning a new request to a representative can be very slow. Correspondingly, when you delete a request, Enterprise Objects Framework fires the corresponding representative's serviceRequests fault so it can remove the request from the array.

Workaround: Set the inverse, to-many relationship so it isn't a class property. For example, in the above request-representative scenario, you would remove the serviceRequests relationship from the class properties of the CustomerServerRepresentative entity.

Reference: 82173

Issue: EOAdaptorChannel.h has an erroneous comment for the method fetchRowWithZone:.

Description: When fetchRowWithZone: returns nil signaling the end of the result set, isFetchInProgress can return YES to indicate that there are more result sets. The comment should read:

```
- (NSMutableDictionary *)fetchRowWithZone:(NSZone *)zone;

   // Fetches the next row from the result set of the last

   // -selectAttributes:...  message and returns values for the attribute

   // names in attributes. When no rows are left, this method invokes

   // adaptorChannel:didFinishFetching:, and returns nil.

   // For adaptors that can have multiple result sets (ODBC and Sybase),

   // This method will return nil at the end of each result set, however

   // isFetchInProgress will return YES. The channel will also send the

   // delegate an an adaptorChannelDidChangeResultSet: message whenever

   // the end of one result set has been reached and another one is

   // pending.

   // This methods may raise an exception if an error occurs.
```

Control Layer

These issues exist in the control layer of this Enterprise Objects Framework release:

Reference: 82210

Issue: Attempt to copy an EOSortOrdering object throws an exception:

*** -[EOSortOrdering copyWithZone:]: selector not recognized

Workaround: Don't copy EOSortOrderings, or implement copyWithZone: in a category on EOSortOrdering.

Reference: 68146

Issue: Fault failure leaves EOInterface layer unstable.

Description: If a displayed enterprise object has a to-one relationship to a non-existent destination row, attempting to access the destination object raises an exception and corrupts the state of user interface objects. (Enterprise Objects Framework raises an exception when a to-one relationship cannot be resolved due to a referential integrity issue in the database).

Workaround: See the chapter "Advanced Enterprise Object Modeling" in the Enterprise Objects Framework Developer's Guide for information on handling optional to-one relationships.

Reference: 64084

Issue: Inserted enterprise objects don't get removed from EODisplayGroup after sending revert to EOEditingContext.

Description: If you fetch objects into an EODisplayGroup, insert a few objects, delete a few objects, and then update a few objects; telling the EOEditingContext to revert backs out the updates, but not insertions or deletions. The actual insertions and deletions have been reverted, but the EODisplayGroup doesn't know how to revert its object list (since is doesn't keep track of what its original object list was before the insertions and deletions).

Workaround: Programmatically tell all affected EODisplayGroups to refetch after telling the EOEditingContext to revert, or use refetch: (invalidateAllObjects:) instead of revert.

Reference: 72177

Issue: Deleted objects are still registered in the EOEditingContext after a saveChanges operation.

Description: If an object is deleted in the EOEditingContext and then the EOEditingContext is saved, the deleted object isn't forgotten by the EOEditingContext (i.e., sending the EOEditingContext the message objectForGlobalID: should return nil, but it doesn't).

Workaround: Fortunately, this should have no affect on most applications. However, if you need to work around this issue, remember the deleted objects in the editingContextWillSaveChanges: delegate, and then invoke forgetObject: for each object after a successful save.

Reference: 72269

Issue: You can't tell Enterprise Objects Framework to not undo your changes when delete propagation fails.

Description: The EOEditingContext delegate method editingContextShouldUndoUserActionsAfterFailure: is supposed to allow programs to indicate that they do not want user actions undone if a validation or delete propagation error occurs. However, the EOEditingContext undoes the user action regardless of the return value from the method.

Workaround: None.

Reference: 72903

Issue: Aborted deletions are incorrectly recorded in the undo stack as empty undos.

Description: When the deletion of an object fails due to a deny rule, the undo manager records an empty undo group. This means that although nothing actually happened during the operation, the operation still needs to be undone before previous operations can be undone. For interactive programs this is not normally an issue since users rely on visual cues to determine how many times to undo. However, this may be an issue for code that programmatically performs undo operations.

Workaround: None.

Reference: 74965

Issue: The EOEditingContext delegate method editingContext:shouldPresentException: isn't called when saveChanges is invoked programmatically.

Description: If you use the following code:

```
eo = [[[Movie alloc] init] autorelease];

[eo setTitle:nil];   // Assume that the TITLE column doesn't allow NULLs

[editingContext insertObject:eo];

      [editingContext saveChanges];
```

the editingContext:shouldPresentException: delegate method isn't called. Instead, an exception is raised.

However, if you instead set a user interface control object as the target for the editing context's saveChanges: action, the delegate method is

invoked.

Workaround: Always use saveChanges: instead of saveChanges. If you don't have an argument to pass, just use

```
[editingContext saveChanges:nil];
```

Reference: 76466

Issue: EOEditingContexts don't propagate uninserts.

Description: Propagate delete works fine for an object that that is fetched from the database. However, if an object is created and inserted in an editing context and then deleted (thus never being saved to the database), the delete isn't propagated to the destinations of the object's relationships. For example, suppose you create an ExpenseReport object and several LineItems for it. If you then delete the ExpenseReport, the delete doesn't propagate to the LineItems. If the LineItems can't exist without an owning ExpenseReport, EOEditingContext's saveChanges fails when the delete is performed within the same event as the insert.

Workaround: Call [editingContext processRecentChanges] before deleting the previously inserted object.

Reference: 76901

Issue: Associations are refreshed too early when a modal panel (such as the fetch limit panel) is raised, possibly causing an exception.

Description: Suppose you have two EODisplayGroups that are set to fetch on load. If the second display group to fetch exceeds the fetch limit, an alert panel inquiring whether to continue the fetch pops up. Presenting the panel causes the run loop to flush the first display group's user interface drawing. If the first display group's user interface displays enterprise object properties via key paths, EOFaults may be fired. Since the default EODatabaseChannel is busy with the fetch for the second display group, an exception is raised because there isn't an available channel.

Workaround: There are several workarounds:

1. Don't use the fetch "prompt on limit" feature.

2. If your application only uses modal panels for alerts and warnings, disable the modal refresh by sending the following message in your application's initialization code (make sure to awake the EODisplayGroup first so it's initialize method is called before you send this message):

```
[[EODelayedObserverQueue defaultObserverQueue]

setRunLoopModes:[NSArray arrayWithObject:NSDefaultRunLoopMode]]
```

3. Implement your own fetch limit panel that doesn't invoke a modal event loop.

4. Register an additional EODatabaseChannel with the EODatabaseContext so the fetch of the faults can occur while the second EODisplayGroup fetch is paused.

Reference: 77181

Issue: The EOQualifier contains operator doesn't do SQL generation.

Description: The contains operator is meant to do to-many array comparison. For example, you might query on the Studio entity using the following qualifier format:

```
"movies contains %@", someMovieObj
```

The resulting qualifier works for an in-memory search, but doesn't generate SQL for a database search.

On the other hand, using the equality operator for to-many array comparison kind of works in SQL, but not in memory. For example, you might query on the Studio entity using the following qualifier format:

```
"movies = %@", someMovieObj
```

The resulting qualifier returns no matches when evaluated in memory because the array property is not equal to the movie object as determined by isEqual:. However, when it's evaluated in the database, it returns the same studio N times (where N is the number of movies in the Studio's movies array), even though the qualifier is attempting to match only one movie.

Workaround: Use the contains operator for qualifiers in-memory evaluation and the equality (=) operator (with usesDistinct on the fetch specification) for evaluation in the database.

Miscellaneous Framework

These issues exist in this Enterprise Objects Framework release:

Reference: 46679

Issue: Enterprise Objects Framework's private instance variables aren't declared @private and don't have names that begin with the underbar ('_') character.

Description: All instance variables in Enterprise Objects Framework should be considered private.

Workaround: Don't directly access Enterprise Objects Framework instance variables.

Reference: 69211

Issue: Link errors on Windows NT.

Description: Programs on Windows NT must add explicit references to at least one class in each framework in order to avoid link errors at run time.

Workaround: Add a function like that in the following code snippet, which refers to classes in each of Enterprise Objects Framework's layers. Though never invoked, it forces the appropriate linking to occur.

```
#ifdef WIN32

#import <EOControl/EOControl.h>

#import <EOAccess/EOAccess.h>

#import <EOInterface/EOInterface.h>

void _referenceAllEOFrameworks()

{

       [EODisplayGroup new];       // EOInterface

       [EOEntity new];             // EOAccess

       [EOEditingContext new];     // EOControl

}

#endif
```

If you create your project with the type "EOApplication," this code is automatically added to your project main file.

Reference: 72027

Issue: EOKeyValueCoding is broken for doubles on HPUX PDO.

Description: EOKeyValueCoding doesn't work correctly for accessor methods that set and return doubles on HPUX under PDO 4.1 (and previous releases). This means that users cannot correctly fetch enterprise objects that have class properties with accessor methods that use doubles.

Workaround: Change your enterprise objects' accessor methods to return and take as arguments NSNumbers, NSDecimalNumbers, or ints.

Informix Adaptor

These issues exist in the Informix adaptor supplied with this release of Enterprise Objects Framework:

Reference: 64031

Issue: Informix adaptor user defaults for Enterprise Objects Framework 2.x are different than those for Enterprise Objects Framework 1.2.

Description: In Enterprise Objects Framework 1.2, the InformixAdaptor stores defaults in the EOFInformixAdaptor domain and uses the following keys:

INFORMIXDIR, DBDATE, DBLANG, DBMONEY, InformixLogErrors, ShowSystables, ShowTableOwner, Beautify, DefaultIsolationLevel, GlobalOptimization, GlobalExplain, GlobalLockMode, GlobalPDQPriority, GlobalDataSkip, GlobalConstraints, DatabaseExclusive

Enterprise Objects Framework 2.x stores defaults in the standard NSGlobalDomain and prefixes all keys with ÂªInformixÂº, that is:

InformixINFORMIXDIR, InformixDBDATE, InformixDBLANG, InformixDBMONEY, InformixLogErrors, InformixShowSystables, InformixShowTableOwner, InformixBeautify, InformixDefaultIsolationLevel, InformixGlobalOptimization, InformixGlobalExplain, InformixGlobalLockMode, InformixGlobalPDQPriority, InformixGlobalDataSkip, InformixGlobalConstraints, InformixDatabaseExclusive.

Workaround: None.

Reference: 70232

Issue: Informix adaptor raises an exception when you try to sort on attributes that are not in the select list.

Description: Due to a restriction in the Informix adaptor, it's not possible to sort on attributes that aren't included in the select list. This means that it isn't possible to sort the results using an attribute that is not marked on the entity as either a primary key, used for locking, or a class property.

Workaround: If possible, add the attribute to the entity and mark it as used for locking. Otherwise, there is no workaround.

ODBC Adaptor

These issues exist in the ODBC adaptor supplied with this release of Enterprise Objects Framework:

Reference: 81774

Issue: Can't save large BLOB's to SQLServer

Description: If you try to save large BLOB's (more than 1 meg), you will probably encounter a segmentation violation. This is happening because something in the ODBC stack can't handle large buffers.

Workaround: You can add a special EOF flag to the driverInfo dictionary that will cause EOF to use the SQLPutData() function to break up large BLOB's into smaller pieces for transmission. To enable this behavior, add the following line to your driverInfo dictionary in the EOModel.

```
EOF_ENABLE_SQLPUTDATA = Y;
```

Starting with EOF 2.2, this flag is always set when you reverse engineer a model, but older models created with EOF 2.1 or EOF 2.0 will not have the flag.

Warning to users of MS-Access: The ODBC Access driver doesn't handle the SQLPutData() calls correctly, so Access users should not turn this flag on. It will be set to "N" by default when reverse engineering an Access database.

Oracle Adaptor

These issues exist in the Oracle adaptor supplied with this release of Enterprise Objects Framework:

Reference: 82299

Issue: On NT, you can't use gdb on an app running against the oracle adaptor.

Description: It has been reported that running gdb on an application running against the OracleAdaptor can sometimes result in unexplained crashes or hangs, even when the same application works when run from outside the debugger. It seems that something in the Oracle Tracing mechanism causes the entire process to behave unpredictably when running within gdb. Some people never see this issue, others may see it occasionally, some may never be able to run gdb acceptably.

Workaround: There are several ways to deactivate this tracing. The easiest is to remove tracing from the registry by renaming the HKEY_LOCAL_MACHINE\\SOFTWARE\\ORACLE\\OTRACE73 entry.

Reference: 77517

Issue: If you try to update an enterprise object with an attribute that maps to a LONG RAW column while using on-demand locking, you get the following exception:

"fetchObject -- EODatabaseChannel 0x12345678: attempt to

lock object that has out of date snapshot"

Description: It appears that the Oracle database sometimes returns wrong BLOB values when it's passed "SELECT ... <long-raw-column,... FOR UPDATE". So when the EODatabaseChannel attempts to acquire a lock on the row, the results of the SELECT don't match the results that were gotten on the last SELECT (without the FOR UPDATE clause).

Workaround: None. You can't use on-demand locking if you're going to be updating tables with LONG RAW columns.

Reference: 77366

Issue: If you're using pessimistic locking in combination with batch faulting or prefetching of relationships, you'll get the error "ORA-01786: FOR UPDATE of this query expression is not allowed" when you run your application.

Description: When you use pessimistic locking mode in combination with batch faulting or prefetching of relationships, Enterprise Objects Framework generates a SQL statement like the following:

<OracleSQLExpression: "SELECT DISTINCT t0.CATEGORY, t0.DATE_RELEASED, t0.LANGUAGE, t0.MOVIE_ID, t0.RATING, t0.REVENUE, t0.STUDIO_ID, t0.TITLE FROM DIRECTOR t1, MOVIE t0 WHERE t1.TALENT_ID = :talentID AND t0.MOVIE_ID = t1.MOVIE_ID FOR UPDATE" withBindings:{talentID = 87; }>

This statement fails with the ORA-01786 error. The Oracle RDBMS doesn't support the use of DISTINCT with the FOR UPDATE clause.

Workaround: If you use the pessimistic locking mode against an Oracle database, you can't use the batch faulting or prefetching features.

Reference: 62425

Issue: Oracle Adaptor doesn't read stored procedures inside of packages.

Description: There is no way to get the database to tell you the components (procedures and functions) that are inside a package definition. Clients can still create stored procedures in the model that will call into packages, it's just that model description using EOModeler won't create these at connect time.

Workaround: You can use EOModeler to create the stored procedure definitions in the model. Just set the external name of the stored procedure to package-name.procedure-name.

Reference: 73333

Issue: The Oracle adaptor has character set issues on Sparc and m68k.

Description: The Oracle adaptor on Mach does not properly support certain character set conversion on certain architectures:

- On SPARC ISOLatin1 works, but Japanese character sets do not.
- On m68k non-ASCII ISOLatin1 characters are stripped and Japanese character sets don't work at all.

On Intel all character sets work fine, including European and Japanese.

Workaround: To get non-ASCII character sets on SPARC and m68k, install the EO2JOracleAdaptor.pkg that's on the Enterprise Objects Framework 2.1 Mach CD.

Note: The EO2J Oracle Adaptor is built with the 7.0 version of the Oracle client libraries. Consequently, returning fetch sets from stored procedures is not supported.

Reference: 77990

Issue: Sometimes when you run the install_database script or use the schema object creation window in EOModeler, you might get one of the following errors.

```
Mar 27 10:19:34 eoutil[1577] Exception running dump: ORA-00955: name is already used by an existing object

create table  !!! eo_temp_table as select max(MOVIE_ID) counter from MOVIE

Mar 27 10:27:54 eoutil[1591] Exception running dump: ORA-00955: name is already used by an existing object

create procedure  !!! eo_set_sequence is

   xxx number;

   yyy number;

begin

   select max(counter) into xxx from eo_temp_table;

   if xxx is not NULL then

       yyy := 0;

       while (yyy < xxx) loop

           select MOVIE_SEQ.nextval into yyy from dual;

       end loop;

   end if;

end;
```

Description: If the primary key support code dies unexpectedly, it can leave the eo_set_sequence stored procedure and the eo_temp_table table in the user's schema. This isn't an issue right away, but any subsequent attempt to run the install_database script will fail because the statements that attempt to create these schema objects will fail and the data loading will stop before it is finished.

Workaround: Use the following commands from SQLPlus to remove these objects before you attempt to create the schema objects with the install_database script.

```
SQL> drop table eo_temp_table;

SQL> drop procedure eo_set_sequence;
```

Sybase Adaptor

These Issues exist in the Sybase adaptor supplied with this release of Enterprise Objects Framework:

Reference: 62634

Issue: The Sybase adaptor uses CS_CONVERT() to convert numeric data into NSDecimalNumbers.

Description: Fetching decimal numbers in locales that use a characters other than `.' for the decimal may not work.

Workaround: None.

Reference: 63169

Issue: Models created for version 4.9 Sybase servers do not include stored procedures.

Description: EOModeler gets stored procedure information using functionality that isn't provided in old servers.

Workaround: Use EOModeler's Stored Procedure Editor to add EOStoredProcedure objects to a model.

Reference: 74633

Issue: You can't link against the Sybase1x framework.

Description: The Sybase1x framework has a bug in its sybase1x.lib, such that anything linked against it attempts to load the nonexistent Sybase.dll (rather than Sybase1x.dll). If you never access an adaptor-specific class such as SybaseChannel, you won't have issue. However, if you do reference an adaptor-specific class, your application (or framework) won't be able to initialize.

Workaround: Make a copy of the Sybase1x.dll named Sybase.dll.

Reference: 75024

Issue: The SQL generation for primary key support in the Sybase adaptor isn't sufficient.

Description: The SQL generated by EOModeler to support primary key generation in Sybase simply invokes the sp_primarykey stored procedure. sp_primarykey adds useful information to the syskeys table, but doesn't create constraints that enforce uniqueness (or NOT NULL) in the primary key columns.

Workaround: Add the constraints yourself using statements of the following form:

```
alter table <table-name> add constraint primary key (<column-name> {, <column-name })
```

EOModeler

These issues exist in EOModeler with this release of Enterprise Objects Framework:

Reference: 77880

Issue: EOModeler exhibits odd behavior if you try to paste model objects from a closed window.

Description: Copy a model object (or objects), close the window from which you copied, and then open a new window. The Paste menu item is enabled in the new window, but if you try to paste, nothing happens.

Workaround: Don't close the original window before pasting the model objects.

Reference: 77608

Issue: Existing Enterprise Objects Framework projects don't see the new Enterprise Objects Framework 2.1 source code generation templates (used when you issue the "Generate Source Files..." command in EOModeler).

Description: Enterprise Objects Framework 2.1 includes fixes and additions to EOInterfaceFile.template and EOImplementationFile.template. If a user has a project from Enterprise Objects Framework 2.0 that contains the old versions of these files, the old versions will continue to be used.

Workaround: If you didn't customize the templates, then you should just remove these old files from your project.

If want to build a customized template based on the newest versions, copy /NextDeveloper/Apps/EOModeler.app/Resources/EOImplementationFile.template and /NextDeveloper/Apps/EOModeler.app/Resources/EOInterfaceFile.template into your project directory.

Reference: 77134

Issue: If you open two different Diagram View windows for the same model file, the layout for only one of the windows is saved, and which layout is saved is indeterminate.

Workaround: Only open one Diagram View window for a model at a time.

Reference: 77191

Issue: Pasted attributes do not retain their primary key, used for locking, or class property settings.

Description: If you copy and paste an attribute, the pasted attribute's primary key, used for locking, and class property bits revert to their default settings, regardless of their state in the original. This occurs because the settings are actually maintained by the owning entity, which isn't incorporated into an attribute's pasteboard rendering.

Workaround: Manually set the bits after pasting.

Reference: 63118

Issue: Schema generation may produce identifiers that are too long.

Description: If your database table names are long, the names generated for constraints may be too long.

Workaround: Shorten your table names, or edit the SQL EOModeler generates to shorten the constraint names.

Reference: 51250

Issue: You can't join on derived attributes.

Description: Invalid SQL is generated whenever a derived attribute is designated as a join attribute in a relationship.

Workaround: None.

On-line Examples

These issues exist in the on-line examples included in this release of Enterprise Objects Framework:

Reference: 65165

Issue: install_database doesn't work: Sybase: Can't find type `decimal'.

Description: The install_database script in the EnterpriseObjects/DatabaseSetUp directory doesn't work for Sybase 4.9 servers.

When the models in the examples directory were converted to Sybase, the server version wasn't taken into account. Some of the attributes were converted to Âªdecimal Âº data type and the Sybase 4.x server doesn't know about these.

Workaround: Use EOModeler to find and change all the external types from decimal to float in each of the models in your examples directory.

Reference: 68231

Issue: make all in the Enterprise Objects Framework examples fails sometimes.

Description: The Enterprise Objects Framework examples will fail to make if ${NEXT_ROOT}/LocalDeveloper is present on your system and you don't have write access to it. The makefile tries to install the BusinessLogic framework in the /LocalDeveloper/Frameworks directory.

Workaround: Execute make as root or ask your system administrator to create a /LocalDeveloper/Frameworks directory and make it writable by you. Alternatively, use ProjectBuilder to change the install directories for BusinessLogic and EOExtensions to a location that's writable by you, then change all the projects that depend on BusinessLogic or EOExtensions to look in the new location.

Reference: 70557

Issue: The Customer.app example doesn't propagate changes to CreditCard objects.

Description: The relationship between CreditCard and Member is not modeled correctly in the examples. CreditCard's primary key is composed of its cardNumber and cardType attributes. In the Customer application, you can modify the cardNumber and cardType of a Member's CreditCard, but these changes aren't propagated to the objects to which the CreditCard is related. That is, after saving the changes to the database, the CreditCard's cardNumber and cardType are updated, but foreign keys in the MEMBER table still have the old values.

CreditCard should have a separate primary key identifier, such as cardID, on which the CreditCard-Member relationships are based. This approach would keep CreditCards and Members in sync, and it would also be a more efficient implementation.

Workaround: None.

Reference: 72246

Issue: The ODBC adaptor source code provided as an example is only available on OpenStep for Windows NT.

Description: The source code for the ODBC adaptor is available on Windows NT as an example. It is not, however, included on Mach or PDO.

Workaround: Copy the source code from an NT machine.

Note: If you just want the ODBC adaptor to see an example of a concrete adaptor, you can look at the FlatFile adaptor that's included in all releases.

Reference: 76020

Issue: In the Studios.app, buying the movies associated with a Talent doesn't update the Movies' Studios.

Description: The Studio class's buyAllMoviesStarring: method doesn't take advantage of Enterprise Objects Framework's EOKeyRelationshipManipulation methods. Instead, it simply invokes [self addToMovies:...].

Workaround: Change Studio.m's buyAllMoviesStarring: implementation to the following:

```
- (void)buyAllMoviesStarring:(Talent *)talent

{

   NSEnumerator *movieEnumerator = [[talent moviesStarredIn] objectEnumerator];

   id movie;

   while ( (movie = [movieEnumerator nextObject]))

       [self addObject:movie toBothSidesOfRelationshipWithKey:@"movies"];

}
```

Reference: 69419

Issue: Example data for Movie and Rental models must be installed in different databases for Sybase and Informix.

Description: When installing data for more than one model in a database, the eo_sequence_table is only properly initialized for the first model installed.

Workaround: You can either install the data for each model in a different database or change the last line in the install_database script located in the DatabaseSetUp directory of your examples directory as follows:

Change this:

```
${EOUTIL} dump ../BusinessLogic/Rentals.eomodeld -source plist database -schemaCreate -postInstall <
RentalData.plist
```

To this:

```
${EOUTIL} dump ../BusinessLogic/Rentals.eomodeld -source plist database -schemaCreate -postInstall -force <
RentalData.plist
```

When you use the -force option as a workaround, exceptions are logged because the eo_sequence_table table and eo_pk_for_table procedure already exist when you execute install_databases. You can just ignore these exceptions.

Documentation

This issue exists in the documentation included in this release of Enterprise Objects Framework:

Reference: 77170

Issue: Enterprise Objects Framework Developer's Guide sections about ordering database operations are out of date.

Description: The sections "How Do I Order Database Operations" and "Constraints for Enforcing Relational Integrity Rules" in the chapter "Answers to Common Design Questions" in the Enterprise Objects Framework Developer's Guide need to be updated to reflect a new operation ordering algorithm.

The new algorithm works as follows:

- If an entity (Movie) has a to-one relationship to a second entity (Studio) and the inverse relationship is a to-many, then the second entity (Studio) is considered the master.
- If an entity (Talent) has a to-one relationship to a second entity (TalentPhoto) and the inverse relationship is also a to-one, then the entities are peers.

Enterprise Objects Framework builds up an entity ordering based on the "master-ness" of the entities. This ordering is built up dynamically and is enhanced as your application touches more and more entities.

Before sending operations to the database, Enterprise Objects Framework orders the operations based on the entity ordering. For inserts, Enterprise Objects Framework orders master entities first; whereas for deletes, Enterprise Objects Framework orders master entities last. Order on updates doesn't generally matter, Enterprise Objects Framework orders masters first.

This new algorithm should reduce the number of scenarios in which you have to reorder operations. However, if your database has sophisticated referential integrity, if it uses triggers, or there are referential integrity constraints that are not modeled as EORelationships, you may still need to reorder adaptor operations programmatically.

Enterprise Objects Framework Defaults

This section lists the user defaults for which Enterprise Objects Framework checks and changes its behavior.

Defaults in the NSGlobalDomain

To change these defaults, issue a command such as the following from a shell:

defaults write NSGlobalDomain EOAdaptorUseBindVariables NO

EOFDebugEditingContext

Default is NO.

EOControl Layer will log every time an object is changed.

EOFDebugUndo

Default is NO.

Logs each time something is pushed on or popped off an undo list.

Also logs in [_EOUndoStack dealloc].

EOAdaptorDebugEnabled

Default is NO.

Logs for connection attempts, all transaction activity (begin, rollback, commit), and SQL statements (select, update, etc.).

EOProjectSourceSearchPath

An optional array of paths in which EOAccess searches for framework project directories that contain models.

EOAdaptorUseBindVariables

Default is YES.

Controls whether or not the SQL generation process will use bind variables (for Oracle

and Informix).

EOOracleTableNamesSQL

SQL statement used to identify tables for the model reverse-engineering process.

Default is:

SELECT TABLE_NAME FROM USER_TABLES ORDER BY TABLE_NAME')

If you would like the model reverse-engineering to look at a different set of the tables, you can provide your own SQL statement, for example:

SELECT TABLE_NAME FROM USER_TABLES ORDER BY TABLE_NAME

WHERE TABLE_NAME not in ('MY_USELESS', 'FOO')

EOOracleUseNoWaitLocks

Default is NO.

Controls whether Oracle uses NOWAIT locks.

EOSybaseInterfacesFile

Default is unset.

If the default is set, the SybaseAdaptor initializes the client library to run with this interface the specified interfaces file. This default is not applicable on Windows NT.

EOSybaseTableNamesSQL

This default can be used to change the default SQL used to determine the tables that are analyzed in creating a new model.

Default is

select name from sysobjects where type = 'U' or type = 'V'

EOSybaseAttributeSQL

SQL statement used to get the attribute information for a given table.

Default is

select a.name attr_name, b.type attr_type, b.name type_name, b.allownulls allownulls, c.type primary_key, a.length width, a.prec prec, a.scale scale from syscolumns a, systypes b, syskeys c where a.id = object_id('%@') and a.id *= c.id and (a.colid *= c.key1 or a.colid *= c.key2 or a.colid *= c.key3 or a.colid *= c.key4) and (c.type = 1 or c.type is null) and a.usertype = b.usertype and datalength(a.name) > 0 order by a.name

EOSybaseRelationshipSQL

Default is

select a.keycnt, b.name tname, c.name cname, d.name dtname, e.name dcname from syskeys a, sysobjects b, syscolumns c, sysobjects d, syscolumns e where (b.type = 'U' or b.type = 'V') and a.depid is not null and a.depid > 0 and b.id = a.id and b.id = c.id and ((c.colid = a.key1 and e.colid = a.depkey1) or (c.colid = a.key2 and e.colid = a.depkey2) or (c.colid = a.key3 and e.colid = a.depkey3) or (c.colid = a.key4 and e.colid = a.depkey4)) and d.id = a.depid and d.id = e.id order by b.name, d.name

EOSybaseStoreProcedureSQL

Default is

select name, id from sysobjects where type = 'P'

EOSybaseStoredProcedureDetailsSQL

Default is

sp_sproc_columns %@

InformixINFORMIXSERVER

No default value.

The name of the Informix server.

InformixInformixTableNamesSQL

This default can be used to change the default SQL used to determine the tables that will be analyzed in creating a new model.

Default is

select tabname, owner, tabid from informix.systables where (tabid > 99) and (tabname <> 'ANSI') order by tabname

Defaults in the EOModeler Domain

To change these defaults, issue a command such as the following from a shell:

```
defaults write EOModeler DisableInheritenceCheck YES
```

BundlesToLoad

If you write extensions to EOModeler, you can get EOModeler to load them by setting this default. This default is an array, so remember to include parentheses when you set it. For example:

defaults write EOModeler BundlesToLoad "(/LocalDeveloper/ModelerBundles/MyModelerBundle.bundle, $HOME/eoexamples/ModelerBundle/ModelerBundle.bundle) "

RECORD_FETCH_LIMIT

Default is 100.

For the Data Browser in EOModeler. This controls how many rows to fetch before asking users if they want to fetch all, fetch another n rows, or just stop now.

Consistency Checks

All of the following defaults have the default NO:

DisableConsistencyCheckOnSave

DisableExternalNameCheck

DisableInheritenceCheck

DisablePrimaryKeyCheck

DisableRelationshipCheck

DisableStoredProcedureCheck

SkipBeautifyNamesOnModelCreation

Default is NO.

Setting this default to YES will cause EOModeler to leave the entity names and attribute names matching the exact names of their corresponding database objects (including the case).

DisableAdvancedOptions

Default is NO.

If set to YES, the EOModeler runs in "Simplified mode". The advanced inspectors don't

appear, the choices of table view columns is limited, and so on.

WebObjects compatibility guide

This article has been archived and is no longer updated by Apple.

The tables below list which operating systems, Web servers, databases, and other third-party software have been tested for compatibility with WebObjects. All databases in the tables below have been qualified unless otherwise noted. A database listed as "unqualified" has been previously qualified and has a JDBC plugin, but is not tested as regularly as a qualified database. An effort will be made to resolve compatibility issues with a supported database whether qualified or unqualified.

Note: For minor "dot release" versions (such as 5.2.1) please refer to the Release Notes provided with the update.

WebObjects 5.4

Operating Systems
Mac OS X 10.5 Leopard (Developer only)
Mac OS X Server version 10.5 (Deployment only)
Java
SDK 1.5
Web Servers
Tomcat 6.0
Apache 2.2
Apache 1.3
Databases supported, qualified
FrontBase 4.7
Derby 10.2.2.0
MySQL 5 (Mac OS X Server version 10.5)
OpenBase 10
Oracle 10g Enterprise Edition
Oracle 9i Enterprise Edition, Oracle Thin JDBC Driver 10.1.0.2.0
Databases supported, unqualified
Microsoft SQL Server
Sybase Adaptive Server Enterprise

WebObjects 5.3

Operating Systems
Mac OS X 10.4.1 with Xcode 2.1 (Developer only)
Mac OS X Server 10.4.1 (Deployment only)
Java
SDK 1.4.2
Web Servers
Apache 1.3.33
Databases
Microsoft SQL Server 2000 Standard Edition 8.00.194
MySQL 4.1.10a
OpenBase 8.0
Oracle 10g Enterprise Edition
Oracle 9i Enterprise Edition, Oracle Thin JDBC Driver 10.1.0.2.0
Sybase Adaptive Server Enterprise 12.5, Sybase jConnect JDBC Driver 5.5 (build 25137)

WebObjects 5.2

Operating Systems
Mac OS X 10.2.2 with July 2002 or December 2002 Developer Tools (Developer only)
Mac OS X Server 10.2.2 (Deployment only)

Windows 2000 Professional SP3 (Developer only)
Windows 2000 Server SP3 (Deployment only)

Solaris 8 (Deployment only)

Java

SDK 1.3.1

Web Servers

Apache 1.3.9 (shipped with Solaris 8.0) and 1.3.27 (shipped with Mac OS X 10.2)
Sun ONE Web Server 6.0 SP2
Microsoft Internet Information Server 5.0

Databases

Microsoft SQL Server 2000 Standard Edition 8.00.194 (Intel X86), driver 2.2.0022
MySQL 3.23.51 (shipped with Mac OS X Server 10.2), driver MySQLConnector/J 2 2.0.14
OpenBase 7.0.8 (shipped with WebObjects 5.2 Developer), OpenBase JDBC Driver 1.11
Oracle 8i Enterprise Edition 8.1.7.0.0 (Production), Oracle JDBC driver 8.1.7.0.0
Oracle 9i Enterprise Edition 9.2.0.1.0 (Developer), Oracle JDBC driver 9.2.0.1.0
Sybase Adaptive Server Enterprise 12.5.0.2 (Early Adaptor), jConnect JDBC driver 5.5 (Build 25137)

LDAP Servers

Sun ONE Directory Server 5.0
OpenLDAP 2.0.25

Third-Party Application Servers

Apache Tomcat 3.2.4 and 4.0.5
BEA WebLogic 7.0
IBM WebSphere 4.0.4
JBoss 3.2.3 (starting with 5.2.3)
Tomcat 4.1.29 (starting with 5.2.3)

WebObjects 5.1

Operating Systems

Mac OS X 10.1.1 with Mac OS X 10.1 December 2001 Developer Tools
Mac OS X 10.1.3 (starting with 5.1.1)
Mac OS X 10.1.4 (starting with 5.1.2)
Mac OS X 10.2 (starting with 5.1.4)
Windows 2000 Professional SP2
Solaris 2.8 (Deployment only)

Java

SDK 1.3.1

Web Servers

Netscape iPlanet Web Server, Enterprise Edition 6.0 SP1
Apache 1.3.9 (shipped with SunOS 8.0)
Apache 1.3.20 (shipped with Mac OS X 10.1 and Mac OS X Server 10.1)
IIS 5.0

Databases

Oracle 8.1.7
SQL Server 2000 Standard Edition, with beta Merant and Microsoft drivers
MySQL 3.23.42 with 2.0.6 driver (shipped with Mac OS X Server 10.1)

LDAP Servers

Netscape iPlanet Directory Service 5.0
OpenLDAP 2.0.15

Third-Party Application Servers

WebLogic 6.1 patch 1
Tomcat 3.2.3 (shipped with Mac OS X Server 10.1; version 4.0.1 used for PetStore example)

WebObjects 5

Operating Systems

Mac OS X 10.0.x
Mac OS X 10.1 (starting with 5.0 Update 3)
Windows 2000 Professional SP1
Solaris 2.8 (Deployment only)

Java
SDK 1.3
Web Servers
Netscape Enterprise Server 4.0 (Solaris)
iPlanet WebServer 4.1 (Windows 2000)
IIS 5.0
Databases
Oracle8i (via JDBC)
OpenBase 6.5 (via JDBC)

WebObjects 4.5.1

Operating Systems
Windows NT 4.0 with Service Pack 4 or 5
Windows 2000 Professional
HP-UX 11 (Deployment only)
Solaris 2.6 and 2.7 (Deployment only)
Mac OS X Server 1.2
Mac OS X Server 1.0 (no Java support, Objective C only)
Mac OS X Server 10.1 (starting with 4.5.1 Update 3)
Web Servers
Netscape Enterprise Server 4.0

WebObjects 4.5

Operating Systems
Windows NT 4.0 with Service Pack 4 or 5
HP-UX 11
Solaris 2.6 and 2.7
Mac OS X Server 1.2
Web Servers
Netscape Enterprise Server 3.6 and 4
IIS 4.0
Apache 1.3.6 (Solaris and HP-UX)
Apache 1.3.9 (Mac OS X Server 1.2)
Databases
Oracle 8.0.3
Sybase 11.0.2
Informix 7.11.UC1
Microsoft SQL Server 7.0
MS-Access 98, driver 4.00.4202.00
OpenBase Lite

WebObjects 4.0.1

Operating Systems
Windows NT 4.0 with SP3 or SP4
HP-UX 10.20
Solaris 2.6 and 2.7
Mac OS X Server 1.0 (starting with 4.0.1 update 2) and 1.2 (starting with 4.0.1 update 3)

WebObjects 4.0

Operating Systems
Windows NT 4.0 with Service Pack 3 or 4

HP-UX 10.20
Solaris 2.5.1 and 2.6
Web Servers
Netscape Enterprise Server 3.5.1 (HP-UX, Solaris)
Netscape Fastrack Server 3.01 (Windows NT)
IIS 3.0 and 4.0b3 (2.0 is no longer supported)
PWS 2.0
Apache 1.3.2 (HP-UX and Solaris)

WebObjects 3.5.1

Operating Systems
Windows NT 4.0
HP-UX 10.20
Solaris 2.5.1 and 2.6
OpenStep for Mach 4.2
Web Servers
IIS 2.0, 3.0 and 4.0b
PWS 2.0

WebObjects 3.1

Operating Systems
Windows NT 3.51 and 4.0
Windows 4.0
HP-UX 10.10
Solaris 2.5, 2.5.1, and 2.6
OpenStep for Mach 4.1
Web Servers
IIS 1.0 and 2.0
PWS 2.0

WebObjects 3.0

Operating Systems
Windows NT 3.51 and 4.0
Windows 4.0
HP-UX 10.10
Solaris 2.5, 2.5.1, and 2.6
OpenStep for Mach 4.0
Web Servers
IIS 1.0 and 2.0
PWS 2.0

WebObjects 2.0

Operating Systems
Windows NT 3.51
Windows NT 4.0b2

WebObjects 1.0

Operating Systems
NextStep 3.3
Windows NT
HP-UX 9.03 and 10.10
Solaris

Notes:

- Windows NT support is for Workstation and Server, on Intel hardware only.
- NeXTSTEP/OPENSTEP support is for Intel and Motorola 68000 family hardware only.
- Solaris support is for Sun (SPARC) hardware only.
- Windows 95 and Windows 98 are not supported for development or deployment.
- For information on Windows 2000 support, see WebObjects: WebObjects and Windows 2000.
- Listings for older WebObjects versions may be incomplete.

Porting WebObjects Applications to Unix Deployment Platforms

This article highlights some common problems encountered moving your WebObjects 3.51 or WebObjects 4 applications from Windows NT or Mac OS X Server to HP-UX or Solaris.
This article has been archived and is no longer updated by Apple.
Note: Any reference in this article to Mac OS X Server pertains to versions 1.x, which were released prior to May 2001.

Q: How do I deploy my application, developed on Windows NT or Mac OS X Server, on a Solaris or HP-UX system?

A: For most applications, all you have to do is install WebObjects on the appropriate platform and compile the application using the "make" utility. Be sure that the developer components are included in your WebObjects installation.

Q: I have an EOF WebObjects application that compiles and runs correctly on Windows NT or Mac OS X Server. I've ported it to HP-UX and it compiles correctly, but when I run it I get a bus error and a core dump. What's happening here?

A: If your application fetches many records at once, or fetches a number of very large objects, you may be running up against HP-UX's default per-process memory limits. Use the "limit" command to check your datasize and stacksize; it is possible for large EOF fetches to fill up the memory allocated for data. For more information on modifying HP-UX kernel parameters, see your HP-UX system administrator or check your HP-UX documentation.

Q: I have an application that compiles and runs correctly on Windows NT. I've ported it to Solaris and it compiles correctly, but when I run it I get the error message:

"Cannot find class or component named <MyCustomScriptedComponent> in runtime or in a loadable bundle."

Why does this error occur on one platform but not the other?

A: Carefully check the capitalization of your component when it is defined and called. This problem can occur when porting a WebObjects or OPENSTEP application from Solaris to Windows NT as a side effect of the fact that Solaris is case sensitive, while Windows NT is not. Thus, if a component called "MySuperGreatObject" is called in your application as "MySupergreatObject", it will compile and run correctly on Windows NT. On Solaris, however, you will get a run-time error. Since Mach and HP-UX are also case-sensitive, improper capitalization may cause run-time or link-time errors on those platforms as well.

Q: Why won't NSTasks run under Solaris?

A: On Solaris, the **fork()** command is used only in non-threaded contexts; **fork1()** is used for multithreaded applications. Because Apple's implementation of NSTask in WebObjects release 3.5.1 does not conform to this usage, you will not be able to use NSTasks on the Solaris platform. Instead, you will have to use **fork1()** and **exec()** to manually spawn a process.

This code example shows how an external task might be set up to run with **fork** and **exec** for Solaris and HP-UX systems, and with NSTask for other WebObjects platforms.

```
- (oneway void)startAppWithInstanceDict:(NSMutableDictionary*)instanceDict {
// if solaris or hpux--make sure the NeXT_PDO and _svr4_ variables are defined
#if ((NeXT_PDO && (__svr4__ || hpux)) || __hpux)
{
//Use fork and exec to launch a task manually for Solaris (and HP-UX) systems.
// we need to build a command string that will look like:
// DocumentPath/exec -a WODefaultAdaptor -n instanceNumber -p portNumber -d DocumentPath
// executable path ...
int····pid;
int·····execReturnValue;
NSString * cmdString;
NSEnumerator *stringEnum;
NSString *aString;
char *cpath, **argvp;
int nargs, n;
int maxfds = getdtablesize();

NSLog(@"Executing non-Mach or non-NT code");

//Determine whether we should use fork() (for HP-UX systems) or fork1() (for Solaris)

#if (hpux || __hpux)
switch ( pid = fork() )
#else
switch ( pid = fork1() )
#endif
{
case 0:
NSLog(@"Enter child process fork(), maxfds = %d", maxfds);

// for ( n = 3; n < maxfds; n++)
{
//···· NSLog(@"Closing descriptor %d, retval = %d", n, close(n));
//···· close(n);
}
```

```
cpath = [fullExePath fileSystemRepresentation];
nargs = [cmdArray count];
argvp = NSZoneMalloc(NULL, (2 + nargs) * sizeof (*argvp));
argvp[0] = (char *)cpath;
for (n=0; n < nargs; ++n)
{
argvp[n+1] = (char *)[[cmdArray objectAtIndex:n] cString];
}
argvp[n+1] = (char *)0;

chdir([currentDir fileSystemRepresentation]);

execReturnValue = execv(cpath, argvp);
NSLog(@"Exec return value is %d", execReturnValue);
exit(127);
break;

case -1:
NSLog(@"*** Error: fork() returned an Error");
break;

default:
NSLog(@"returning to parent process");
// do nothing ...
}
}
#else
{

//Use NSTask to launch the same task on other platforms

aTask = [[[NSTask alloc] init] autorelease];
[aTask setCurrentDirectoryPath:currentDir];
[aTask setLaunchPath:fullExePath];
[aTask setArguments:cmdArray];
[aTask launch];
}
#endif
}
```

Q: My custom EOF subclasses work fine on Windows NT, but when I compile on Solaris I get run-time failures.

A: When writing a subclass of CustomObject under WebObjects 3.5.1, you should be sure that your class defines a constructor that takes the following three arguments:

```
EditingContext ec, ClassDescription cd, GlobalID id
```

If this constructor is missing, the application will still run on Windows NT, but will fail on Solaris systems with the WebObjects Java patch installed. The easiest way to implement this method is simply to call the superclass:

```
public MyCustomEOClass (EditingContext ec, ClassDescription cd,
GlobalID id) {
super (ec,cd,id);
}
```

To save time, you can modify the 3.5.1 EOModeler Java templates to always create this constructor. The templates you'll need to change can be found under:

```
$NEXT_ROOT/Developer/Applications/EOModeler.app/Resources/EOJavaClass.template
$NEXT_ROOT/Developer/ProjectTypes/WebObjectsApplication.projectType/Resources/English.lproj/projectTemplate/EOJavaClass.template
```

And optionally:

```
$NEXT_ROOT/Developer/ProjectTypes/EOApplication.projectTypes/Resources/EOJavaClass.template
```

Under WebObjects 4, the templates have been modified to correct this problem, but you may still encounter it while porting WebObjects 3.5.1 code to WebObjects 4.

Q: When I run my app under Solaris, I get the error message:

```
Program received signal SIGLWP, signal LWP.
```

What is causing this and how can I fix it?

A: These error messages are normal when running WebObjects apps on Solaris under GDB. They will not affect program execution, and they will only occur when running your application under GDB.

Troubleshooting Windows NT WebObjects 3.5.1 Installations

This document covers some of the most common problems encountered while installing WebObjects 3.5.1 on Windows NT 4.0.
This article has been archived and is no longer updated by Apple.

Introduction

You can be confident that your WebObjects installation is correctly installed if:

+ You can run the install program without errors
+ You can successfully launch WebObjects Builder (Developer installations only)
+ You can run the scripted HelloWorld example that ships with WebObjects

Before you try any of these steps, please be sure you've read the post-installation instructions that are installed as part of WebObjects 3.5.1's online documentation. Certain web servers require special installation steps before they will run WebObjects applications correctly.

Before you install

If your Windows NT system has had a previous version of WebObjects or a previous installation of WebObjects 3.5.1 on it, WebObjects may not install correctly. Before installing WebObjeccts 3.5.1, follow the instructions in **TIL article 72556** to completely remove the old WebObjects installation.

Problems installing WebObjects

There are a few common snags you should check for if you have a problem while running the WebObjects installer:

+ Check your Windows NT path variable; a space in your pathname can cause the installer to hang or exit
+ Be sure you're installing the software as the local machine administrator
+ Be sure you're using a developer license string to install developer software, and a deployment license string for deployment-only installations
+ Disable any unusual services you have running. Some services, such as Seagate Crystalinfo Sentinel, can prevent the WebObjects install from completing successfully.

Problems launching WebObjects Builder

The default installation will add WebObjects Builder, as well as a few other applications and documents, to your Windows NT start menu. Under some circumstances, the software will be installed correctly, but the appropriate Start Menu shortcuts will not be created. If this is the case, simply add WebObjectsBuilder, ProjectBuilder, EOModeler, and any other files you want to your Start menu manually. The WOBuilder executable is located under your WebObjects root directory (the default root directory is \\NeXT) at the path NeXTDeveloper\\Apps\\WebObjectsBuilder.app\\WebObjectsBuilder.exe. You may want to check the on-line Post-Install Instructions that were installed with WebObjects to make sure all of the WebObjects files are in the correct place.

If WebObjects Builder hangs or generates an error message when you try to launch it, you may have an incomplete WebObjects installation. You may be able to fix the problem without completely reinstalling WebObjects. First, see if the WebObjects services are running:

+ From the Start menu, select Settings, then Control Panel
+ In the Windows NT control panel, double-click on Services

Look through the list of services. You should see two services called **"NeXT Mach Daemon"** and **"NeXT Netname Server"**. Both should have a Startup value of "Automatic." If either of these services is not present or is not starting automatically, you can try removing and reinstalling the individual services:

+ From a Windows NT command line, change to the NextLibrary\\System directory under your system's NeXT_ROOT directory
+ To remove and reinstall the NeXT Netname Server, type "nmserver -remove" and press return; then type "nmserver -install" and press return
+ To remove and reinstall the NeXT Mach Daemon, type "machd -remove" and press return; then type "machd -install" and press return

If these services are both present and running, check WebObjects' two required background processes:

+ Right-click on the Windows NT menu bar and select "Task Manager" from the menu that appears
+ Click on the "Processes" tab in the Task Manager window

You should see two WebObjects background apps running, **WindowServer.exe** and **pbs.exe**. These two programs should start up automatically when you start your computer. If they do not start up automatically, either start them manually or add them to your Startup program group. WindowServer.exe can be found under the NeXT_ROOT directory at NextLibrary\\System. pbs.exe can be found under the NeXT_ROOT directory at NextLibrary\\Frameworks\\AppKit.framework\\Resources.

Problems running the HelloWorld example

The easiest way to launch the HelloWorld example is to use one of the links from the Examples section of the documentation that is installed with WebObjects. There are three types of error messages you could get while running a WebObjects application.

A **browser** error message indicates that your browser can not communicate with your web server. Normally these messages will appear in their own panel and not in a browser window. These messages normally indicate a problem with your web server configuration. To test your web server setup, try pointing your browser at `http://localhost` or the address of your server machine's home page. Until you can communicate with your web server, you won't be able to communicate with WebObjects. Please contact your web server vendor for help with these problems.

A **server** error message usually indicates that the page you requested couldn't be found on the server or that you don't have permission to access it. It will often have a number along with the error message; for example, "404 not found" or "403 access forbidden". In the case of WebObjects, this means that the server couldn't find the WebObjects adaptor; that is, there is a problem with the path you've entered before the "/WebObjects/" or "/WebObjects.exe/" section. There are a few possible causes for this:

+ Your WebObjects adaptor was not installed. Follow the post-install instructions that installed with WebObjects to make sure that all of WebObjects' components were installed properly.
+ The cgi-bin directory you gave during the installation process was not your server's correct cgi-bin address. Copy the WebObjects and WebObjects.exe files to your server's correct cgi-bin directory.

If neither of these solutions seems to apply, try running another script (an example that came with your web server, for instance) from the cgi-bin directory. Unless you can run scripts in general from that directory, you won't be able to access WebObjects. Please contact your web server vendor for help setting up your web server to run cgi scripts.

There are only a few **WebObjects** error messages you are likely to encounter. "Could not find the application specified in the URL" is the most common; in this case, your server is pointing at the WebObjects adaptor correctly, but the application you specified did not exist. There are a few possible causes for this:

+ The application you're trying to run does not exist, possibly because the WebObjects examples were not installed. Follow the online post-install instructions that installed with WebObjects to make sure that all of WebObjects' components were installed properly.
+ The document root you gave during the installation process was not your server's correct document root. Copy the WebObjects directory to your server's correct document root.

Other WebObjects resources

For more detailed troubleshooting information, please see the online post-install documentation that is installed with WebObjects. To view the online documentation, just choose "**WOHomePage**" from your Windows NT Start menu.

Apple System Profiler: Identifies Video Card as ATY Instead of ATI

When Apple System Profiler (ASP) is run on any Macintosh with an ATI video card installed, the vendor of the card will be identified as ATY rather than ATI and the card name may not be identical to the product name.
This article has been archived and is no longer updated by Apple.
Apple System Profiler is properly displaying the information located in the ROM (Read Only Memory) on the ATI card, or ATI video chipset itself. This is because ATI chose to identify themselves as ATY in the ROM. It is not an issue with ASP nor does it indicate a different vendor.

You will notice this discrepancy after performing the following steps:

1. Run Apple System Profiler 2.1.x or later.
2. Click the Devices and Volumes tab.
3. Click the PCI tab.

The picture below illustrates how the ATI RAGE 128 Pro chipset, used in some Power Macintosh G3 and G4 computers, appears in the ASP Devices and Volumes tab under Mac OS X. The card name and model will vary depending upon what card or chipset is installed. See below for some examples.

ASP Devices and Volumes tab under Mac OS X

Apple System Profiler Identifiers	Display Card Name and Apple System Profiler Data		
	RAGE 128 Pro	**Radeon 7500**	**Radeon 8500**
Card type:	display	ATY,DDParent	ATY,DDParent
Card name:	ATY,Rage128Pd	ATY,BlueStoneParent	ATY,R200Parent
Card model:	ATY,Rage128Pro	ATY,RV200	ATY,R200
Card ROM #:	113-72701-125	113-91701-222	113-85710-123
Card revision:	0	0	0
Card vendor ID:	1002	1002	1002

Table 1 Examples ASP data of some recent display cards

ATI video cards were used in a number of products, including, but not limited to:

- Power Mac G4 - all models
- Power Mac G4 Cube
- iMac - all models
- iBook - all models
- PowerBook G3 - all models
- PowerBook G4
- Power Macintosh G3 (Blue and White)
- Power Macintosh G3

Note: In some models, an alternate video card could be substituted for the ATI card.

MacBinary: File Format Description

This article contains a brief description of the MacBinary file format. A detailed description and technical information is available from Apple's Developer Web Site.
This article has been archived and is no longer updated by Apple.

Overview

Because of the way the Macintosh file system keeps track of files, there was a need to provide this tracking information when transmitting files through a modem. A committee was established, which developed the original MacBinary and later the MacBinary II and MacBinary III format. These formats remain functionally identical, though the MacBinary II format added additional information to maintain the integrity of the file system information and the MacBinary III format added support for extended Finder information introduced in Mac OS 8.

Macintosh Files

Every Macintosh file (through Mac OS 9) contains two parts: a resource fork, which contains data used by an application, such as menus, fonts, and icons; and a data fork, which contains data specific to an application. Additionally, information about the file such as the file type, creator code, Get Info comments, creation date, and modification date are stored by the file system.

Originally, telecommunication programs only sent one part of a Macintosh file (the data fork). This meant that when a binary file was transferred from a Macintosh it lost its icon, and Type & Creator information. Since this information is important to the Macintosh file system, MacBinary was developed.

MacBinary

MacBinary is not a transfer protocol like Xmodem, Kermit, or Zmodem. Instead, it is used in conjunction with a transfer protocol, although it is independent of that protocol. MacBinary can be used when binary files are placed on an FTP server or emailed through the Internet. It allows the various parts of a Macintosh file to be combined into a single chunk of data which can be sent anywhere and downloaded to any kind of computer, and then be reconstructed into the original Macintosh file at the end of its journey.

MacBinary consists of 128 bytes, which are added to beginning of the file. Most Macintosh telecommunication and Internet programs automatically use MacBinary when a binary file is sent. Most applications also allow you to turn off MacBinary. If you are sending a binary file such as a TIFF or JPEG file to someone who uses a Windows computer, you must turn off MacBinary. If you do not turn off MacBinary, the additional 128 bytes at the beginning of the file will corrupt the file. There are ways of removing the MacBinary information, but most of these are designed for Macintosh. At one time there were a couple of MS-DOS terminal programs that automatically detected MacBinary files and stripped off the first 128 bytes of the file.

MacBinary versus BinHex and UUencode

MacBinary, unlike BinHex or UUencode, does not convert the data into a text representation of the binary data. The following articles provide additional information on UUencode and BinHex:

Online Archive Article 18499: "**What Is Binhex & Where To Obtain It**"
Article 18758: "**UUencode & UUdecode: Explained**"

These articles can help you decide the best way to send your files through email systems. If you are placing binary files such as applications, compressed binary files (StuffIt, Compactor), or other Macintosh specific binary files on a remote file server or FTP site here is a chart that can help you determine if you need to use MacBinary or not.

Primary users	MacBinary	Examples
Macintosh	Yes	Applications, Control Panels
MS-DOS/Windows	No	GIF, TIFF, QuickTime, MIDI files
Mixture	No	GIF, TIFF, QuickTime, MIDI files

QuickTime Streaming Server 2.0: Streaming Live Audio or Video

This article describes how to stream live audio or video using QuickTime Streaming Server 2.0.

Notes:

1. All information in this article comes from the help file distributed with QuickTime Streaming Server 2.0. The help file includes additional help topics which are not covered in the Knowledge Base.

2. Any reference in this article to Mac OS X Server pertains to version 1.2, which was released prior to May 2001.

This article has been archived and is no longer updated by Apple.

Streaming Live Audio or Video

You need the following equipment to stream live audio or video:

- Recording equipment for audio, video, or both.
- A computer that has broadcast software and a video or audio capture card installed. You use this computer to capture and encode live audio or video and then broadcast it to your streaming server.
- A Mac OS X Server computer that has QuickTime Streaming Server software installed. You use this computer to send the captured media to your viewers. The streaming server must be connected to the capture and encode computer over an IP network.

Sample Setup for Live Video

The illustration shows a setup for streaming live video and audio. (Most video cameras have a built-in microphone.) You can stream audio only using a microphone, mixer, and other appropriate audio equipment.

A Mac OS computer captures and encodes video and audio. The encoded signal is sent to a QuickTime Streaming Server over an IP network.

A Mac OS X Server with QuickTime Streaming Server sends the signal to client computers who tune in with QuickTime Player.

Figure 1 Live video and audio streaming setup.

Streaming Live Media

To stream live audio or video:

1. Set up your broadcast software following the instructions that came with it.

2. Connect the audio or video equipment to the computer you're using to capture and encode the signal.

3. Use your broadcast software to create a Session Description Protocol (SDP) file on the computer you use to capture and encode the live signal.
See the instructions that came with your broadcast software.

4. Copy the SDP file to your QuickTime Streaming Server computer.
Be sure to copy the file into the media folder you're using for streaming.

5. If you want the streamed media to show on a Web page, set up the Web page.

6. Make sure streaming services are started.

7. Start the capture software by following the instructions that came with the broadcast software.

8. Tell users how to view the streamed media.

IF USERS CAN'T SEE THE LIVE STREAMED MEDIA:

- Make sure you are capturing a signal from the audio or video equipment into the computer you're using for capture and encoding.
- Make sure the SDP file is located in the media folder you set up on your streaming server.

For more information on streaming live media, see these Web sites:

QuickTime Streaming Server 2.0: How to Broadcast Prerecorded Audio or Video

This document describes how to broadcast prerecorded audio or video using QuickTime Streaming Server 2.0.

Notes

1. The information in this document was taken from the help file distributed with QuickTime Streaming Server 2.0. The help file includes additional help topics that are not covered in the Knowledge Base.

2. This document discusses software for use only with Mac OS X Server version 1.2, released prior to 2001-05.

This article has been archived and is no longer updated by Apple.

Broadcasting Prerecorded Audio or Video

With PlaylistBroadcaster you can create a virtual "radio station" or video broadcast by setting prerecorded QuickTime media files to play in a specified order (a "playlist"). PlaylistBroadcaster broadcasts the media to the QuickTime Streaming Server, which sends the media to viewers in the sequence you set up (random or ordered). Although the media is prerecorded, it appears to viewers as a live broadcast. All viewers see the same media being played when they tune in to the broadcast.

To broadcast media, you need to do the following:

- Prepare QuickTime media and a reference movie file.
- Create a playlist.
- Create a broadcast description file.
- Start broadcast service.
- Tell users how to connect to the broadcast.

QuickTime Streaming Server 2.0: Setting Up Authentication

This article describes how to setup authentication using QuickTime Streaming Server 2.0.

Notes:

1. All information in this article comes from the help file distributed with QuickTime Streaming Server 2.0. The help file includes additional help topics which are not covered in the Knowledge Base.

2. Any reference in this article to Mac OS X Server pertains to version 1.2, which was released prior to May 2001.

This article has been archived and is no longer updated by Apple.

Setting Up Authentication

QuickTime Streaming Server comes with two authentication modules you can use to control access to streamed media files.

- **QTSSAccessModule**
  This module lets you set up access to QuickTime streaming services, but not to any other services on your Mac OS X Server.
- **QTSSFilePrivsModule**
  This module lets you set up access to QuickTime streaming services using Mac OS X Server's built-in file access and user and groups database.

Users must have QuickTime Player 4.1 or later to access a media file for which authentication is enabled. The user must enter his or her user name and password to view the media file. Users who try to access a media file with an earlier version of QuickTime installed will see an error message: "`401: Unauthorized.`"

Note: Authentication modules control access to media streamed from your server. It does not control access to media you relay. Access to media streamed from a relay server must be set up by the administrator of the relay server.

Enabling or Disabling an Authentication Module

To enable an authentication module, copy it to the QuickTime Streaming Server modules directory, which is located at `/usr/sbin/QTSSModules`.

To disable an authentication module, remove it from the modules directory, and copy it to another directory, such as the `/usr/sbin/QTSSModules(Disabled)` directory.

When you install QuickTime Streaming Server, QTSSAccessModule is enabled, and the QTSSFilePrivsModule is disabled. If you want to enable the QTSSFilePrivsModule, move it from the `/usr/sbin/QTSSModules(Disabled)` directory to the modules directory.

Setting Up an Authentication Module

After you've enabled the module you want to use, you need to set up access.

If you are using QTSSAccessModule, set up an access file and user and group files.

If you are using QTSSFilePrivsModule, use NetworkManager to set up users and groups, then set up file access.

QuickTime Streaming Server 2.0: Viewing Streamed Media From a Client Computer

This article describes how to view streamed media from a client computer when using QuickTime Streaming Server 2.0.

Notes:

1. All information in this article comes from the help file distributed with QuickTime Streaming Server 2.0. The help file includes additional help topics which are not covered in the Knowledge Base.

2. This article discusses software for use only with Mac OS X Server version 1.2, released prior to May 2001.

This article has been archived and is no longer updated by Apple.

Viewing Streamed Media From a Client Computer

Users can view media streamed from your server using software that supports QuickTime 4, such as QuickTime Player.

Viewing Streamed Media Through QuickTime Player

To view live media from any computer that has QuickTime 4 or later installed:

1. Open QuickTime Player.

2. Choose Open URL from the File menu.

3. Enter the URL for the SDP file. Do not enter the '.sdp' extension.

For example: `rtsp://www.myserver.com/mymedia`

You would replace "`www.myserver.com`" with the DNS name of your QuickTime Streaming Server computer, and "`mymedia`" with the name of your SDP file.

For more information about software that supports QuickTime streaming, see the Apple QuickTime Web site: **http://www.apple.com/quicktime**

Viewing Streamed Media Through a Web Browser

If you want users to view streamed media through a Web browser, you must set up a Web page to show streamed media. Then give the user the URL of the Web page.

If a User Cannot Connect to the Broadcast:

- Make sure the client computer has QuickTime 4 or later installed. If the user is connecting using a Web browser, be sure the QuickTime 4 Plug-in is installed correctly for the browser.
- Make sure the user has the correct URL.
- If you are trying to connect to a broadcasted playlist, make sure the broadcast description file contains the correct IP address, destination base port, and pathname for the SDP file.

If Users See Error Messages While Streaming Media:

- Error code 401 indicates unauthorized access to a protected file. The user may need to upgrade to QuickTime 4.1 or later.
- Error code 404 indicates that the server cannot locate the URL entered by a user. Make sure users have the correct URL to locate the stream.
- Error code 415 indicates the movie file is not hinted or has a compressed movie resource. You need to hint the movie again using the Pro version of QuickTime Player.
- Error code 453 indicates that the server is too busy for a user to view the stream. The user should try again later. You may want to increase the maximum connections in the Settings panel in QuickTime Streaming Admin.
- Error code 454 indicates that the connection to the server was dropped. Users must start viewing the stream again.

QuickTime Streaming Server 2.0: Viewing Access and Error Logs

This article describes how to view QuickTime Streaming Server 2.0 access and error logs.

Notes:

1. All information in this article comes from the help file distributed with QuickTime Streaming Server 2.0. The help file includes additional help topics which are not covered in the Knowledge Base.

2. This article discusses software for use only with Mac OS X Server version 1.2, released prior to May 2001.

This article has been archived and is no longer updated by Apple.

Viewing access and error logs

If logging is turned on in the Settings panel in QuickTime Streaming Admin, information about access and errors is saved to log files.

To open a log:

1. Open QuickTime Streaming Admin.

2. Choose Show Access History or Show Error Log from the Server menu.

Updating and Saving Logs

Each week the current log file is renamed with the current date and a new log file is started. Old log files are saved in `/Local/Library/QuickTimeStreaming/LogArchive`.

To save the information in the current log file at any time:

1. Open the log file

2. Click Reset
The current log file is renamed with the current date and a new log file is started.

Analyzing the Access Log

The information that's stored in the access log can be analyzed using third-party software. See Access log format* for a list of information in the log.

*Editor's note: The Access log format is covered in the article titled "**QuickTime Streaming Server 2.0: Access Log Format**".

Apple Studio Display LCD (DVI): Meaning of LED Colors

My Apple Studio Display with DVI has a green LED that is visible when looking from the rear of the display. What is this LED used for?
This article has been archived and is no longer updated by Apple.
There are two LEDs on the Apple Studio Display DVI. The LED visible from the rear of the display is a visual indication that the display's controller circuitry is on and functioning properly.

The status LED visible from the front of the display is a power indicator light. A solid green LED indicates that the display is powered on and ready to display an image. An amber LED indicates that the display is in the energy saving sleep mode.

How to Set File Type Associations in Windows 95/98

After QuickTime 4 is installed, Windows assigns QuickTime Player and Picture Viewer as the default applications for certain kinds of files. This article explains how to assign a different program as the default application to open a specific kind of file.
This article has been archived and is no longer updated by Apple.
To change file type associations do the following:

1. Right-click a file of the file type you want to change.
A menu appears.

2. Choose Open With from the pop-up menu.
A window appears with applications you can use.

3. Click the checkbox next to the application you want to open the file with.

4. Click the checkbox next to "Always use this program to open this type of file".

5. Click OK.

Setup Assistant: Selecting Canada Chooses French Canadian Format

When Canada is selected as the country of residence in Mac OS Setup Assistant, the keyboard layout, date, time, and numbers are set to French Canadian standards. This article describes how to set these items to the English standards.
This article has been archived and is no longer updated by Apple.

Symptom

The keyboard layout, date, time, and numbers are set to the French Canadian format when Canada is selected in Mac OS Setup Assistant.

Affected Products

- Mac OS 9

Solution

Manually change the appropriate Control Panel settings to the English format. You need to adjust the Numbers, Date and Time, and Keyboard Control Panels. The instructions below explain how to set each individual control panel.

Setting the Numbers Control Panel

1. Open the Numbers control panel.
2. Choose the appropriate number format from the Number Format popup menu.
3. Close the Numbers control panel.

Setting the Date and Time Control Panel

1. Open the Date & Time control panel.
2. Click the Date Formats button.
3. Choose the appropriate date format from the Region popup menu.
4. Click OK.
5. Click the Time Formats button.
6. Choose the appropriate time format from the Region popup menu.
7. Click OK
8. Close the Date & Time control panel.

Setting the Keyboard Control Panel

1. Open the Keyboard control panel.
2. Select the appropriate keyboard layout from the list.
3. Close the Keyboard control panel.

Country Flag in the Menu Bar

If a country flag appears in the right corner of your menu bar, you have more than one keyboard layout selected in the Keyboard control panel. To remove the country flag, open the Keyboard control panel and make sure only one keyboard layout is selected. After selecting only one keyboard layout and closing the Keyboard control panel, the country flag disappears.

Final Cut Pro: Audio Playback Configurations

This article explains audio playback configurations available in Final Cut Pro.

Note: This article primarily describes configurations involving digital video (DV). However, the information may also apply to other configurations.

This article has been archived and is no longer updated by Apple.

Configurations

There are two basic audio configurations which can be used in video editing, audio playback from the internal Macintosh speaker (or external speakers connected to the Macintosh Speaker output connector) and audio playback from an external device.

Figure 1, Typical Video Editing Configuration

View External Video Set to All Frames

When External Video is set to All Frames, audio and video are sent to the external video device attached to FireWire interface. The Macintosh Speaker is disabled in this configuration to prevent an echo effect caused by the latency of video and sound through the FireWire interface. If external speakers are not connected to the video device, no audio can be heard.

Because of delay in the audio coming from a device connected using FireWire, the audio on the external device is not synchronized to the video playback on your computer monitor. Externally connected audio only synchronizes to externally connected video.

For additional information on configuring your digital video system to work with an external monitor, see article 58635 "**Final Cut Pro: Viewing DV Video out of an NTSC or PAL Monitor**".

Monitoring Audio

Having All Frames selected will send both the video and audio out through FireWire. You would monitor audio using whatever video device is connected to the FireWire port. This can include:

1. A built-in camcorder speaker
2. Headphones or externally amplified speakers connected to your camcorder
3. A NTSC/PAL monitor's built-in speaker connected to your camcorder

If you are using a DV to Analog converter box, you must monitor your audio by connecting RCA cables from the audio out to

1. A video monitor's built-in speaker

or

2. Externally amplified speakers

View External Video set to Off

When External Video is set to Off under the View>External Video menu, the audio plays back only from your computer's speaker (or any external speakers or headphones connected to the speaker connector on your computer). This is true even if you do not have Mirror on desktop during Playback selected in the General Preferences tab under the Edit pulldown window.

Final Cut Pro: How to Upgrade to Final Cut Pro 1.2.5

This article describes how to upgrade Final Cut Pro to version 1.2.5, as well as when it is appropriate to upgrade, what steps to follow immediately after using the updater, what new extensions are installed, and what changes have been made to the application.
This article has been archived and is no longer updated by Apple.

Before You Upgrade

It is important to know when it is appropriate to upgrade. Generally, you should never upgrade in the middle of a project. While the Final Cut Pro update process is fast and automatic, recreating necessary preferences and other small changes that happen during the updating process make it an undesirable task to perform when you are in the middle of an edit. In all cases, you should finish your project first, output it to tape, then upgrade Final Cut Pro after the project has been successfully delivered.

If you are using Digital Video (DV) and want to take advantage of the new YUV rendering capabilities of Final Cut Pro 1.2.5, you should finish your project first. Output to tape, then upgrade. Import your project file into the new version, update the project file, re-render it, and output this final version to tape.

Important: Do not install an English version of Final Cut Pro 1.2.5 on a localized version of the Mac OS. Doing so results in extension conflicts.

Installation Requirements

Hardware Requirements

- Power Macintosh G3 computer with a 266 MHz processor or faster (300 MHz processor or faster required for DV)
- PowerBook G3 computer with a 300 MHz processor or faster
- 128 megabytes of RAM
- CD-ROM drive
- 6 Gigabyte A/V rated drive (16 GB recommended)
- ATI built-in video on G3 models or later (required for DV)
- Apple FireWire or other QuickTime compatible digital video card for capturing video from an external source or exporting video to tape.
- The correct FireWire or device control cable and any additional cables you may need for connecting your deck or camcorder to your computer.

Software Requirements

- Final Cut Pro 1.0, 1.0.1, or 1.2.1 (The Final Cut Pro 1.2.5 updater updates any of these versions.)
- Mac OS 9, Mac OS 9.04 recommended
- QuickTime 4.1.2 or later (A QuickTime Pro License is included with the Final Cut Pro CD).

Where to Find the Updater

Final Cut Pro 1.2.5

The Final Cut Pro 1.2.5 updater may be found in the document:

120026 **Final Cut Pro 1.2.5: Document and Software**

Mac OS 9.0.4

If you are using Mac OS 9 and have not updated to Mac OS 9.0.4, the necessary Mac OS updater is located in the Update Mac OS 9 folder on the Final Cut Pro CD. If you do not have Mac OS 9, you must install it first before running the updater.

Before You Run the Updater

Before opening the updater, it is important to follow these guidelines:

- Turn off any security software that you may have installed on your computer.
- Turn off any virus-protection software that you may have installed.
- Do not interrupt the installation process; doing so may result in an incomplete installation and will require you to reinstall Final Cut Pro.

After performing any necessary preinstallation instructions, double-click the Final Cut Pro 1.2.5 updater and follow the on-screen instructions.

Potential Issues when Running the Updater

- When a custom icon is attached to the previously installed version of Final Cut Pro, the 1.2.5 update fails. To resolve this issue remove the custom icon.

Follow these steps to remove the custom icon:

1. Click the Final Cut Pro application icon to select it.

2. Choose Get Info from the Finder's File menu. A new window appears. The custom icon is located in the upper left corner of the info window.

3. Click the icon to select it.

4. Choose Clear from the edit menu. This deletes the custom icon. You can now run the Final Cut Pro 1.2.5 update.

- When the name of the previously installed Final Cut Pro application has been changed, the 1.2.5 update fails. To update Final Cut Pro, rename the original 1.2 version of the application to "Final Cut Pro" All three words must be capitalized, and be separated by spaces.

After You've Run the Updater

Before you open the new version of Final Cut Pro for the first time, do not forget to readjust its memory allocation, as it was reset by the upgrade process. For additional information on allocating additional memory, see article 58630 "**Final Cut Pro: Allocating Memory**".

Now you're ready to open Final Cut Pro, but before you start editing be sure to check the following preferences to make sure that they are correct, since the preferences from your previous version of Final Cut Pro have been moved to the desktop in preparation for deletion:

1. Make sure that the Scratch Disk Preferences are set to the disks you intend to use for video capture.

2. Double-check that the Device Control method is correct for your configuration (DV or Serial).

3. If you are using a serial device for control, you should recalibrate the timecode offset.
For additional assistance in calibrating serial timecode, see article 25154, "**Final Cut Pro: How to Calibrate Serial Timecode**".

4. If you are using a third-party video capture solution, you should set your "Capture Input" and default Sequence Settings appropriately.

Updating Project Files

When updating projects from prior version of Final Cut Pro, an alert box appears with message asking if you want to delete all render files associated with that project. If you have DV footage captured using Apple FireWire you should do this because Final Cut Pro now uses YUV rendering for DV video; rendering with much higher quality than before.

The Final Cut Pro Device Qualification page can be found at http://www.apple.com/finalcutstudio/resources/devicelist.php

If you are using an analog capture card, check the Final Cut Pro Device Qualification page to determine if it takes advantage of YUV rendering. If you have a third party capture solution that does not work with YUV rendering, you should not delete your render files because there is no advantage to rerendering them.

System Software Installed by the Final Cut Pro 1.2.5 Updater

These system software extensions are installed by the Final Cut Pro updater, overwriting any previous versions:

- FireWire Enabler 2.4
- FireWire Support 2.4
- QuickTime FireWire DV Enabler 2.2
- QuickTime FireWire DV Support 2.2

New Features in Final Cut Pro 1.2.5

Final Cut Pro introduces several new features in version 1.2.5:

- Capturing, editing, and exporting of 16:9 wide-screen video
- YUV processing to preserve the values of the original video material
- "Make Reference Movies," enabling the use of pointers to source video files, saving both rendering time and disk space

Issues Addressed in Final Cut Pro 1.2.5

These are some of the known issues that have been addressed in Final Cut Pro 1.2.5:

- Edit Decision Lists (EDL) now get proper timecode when exported with subclips.
- When recapturing PAL media, Final Cut Pro no longer attempts to recapture more media than requested.
- There are memory improvements for better performance with large projects.
- There is better reel name substitution

Final Cut Pro: DV and Widescreen Video Formats Explained

This article discusses the differences between 4:3 and 16:9 video, shooting widescreen video using anamorphic lenses, and working with 16:9 video in Final Cut Pro 1.2.5.
This article has been archived and is no longer updated by Apple.

How is 16:9 different from normal video?

DV video has a frame size of 720x480 pixels. The width to height ratio of the frame is called the Aspect Ratio, and the Aspect Ratio of this frame size is 4:3. It is possible, however, to shoot video for playback using a different Aspect Ratio. The "wide-screen" Aspect Ratio commonly used by video is 16:9, and it allows video producers to create a wide screen experience similar to film.

Videographers and editors must bear in mind, however, that when shooting "wide-screen" video using standard definition DV camcorders, the recorded DV video frame is still 720x480 pixels. Shooting 16:9 visuals and recording them to a 4:3 frame size is referred to as shooting Anamorphic video. An anamorphic image is created when a wide frame is stretched into the same space as a normal frame, with the result being visible horizontal distortion (a "squished" look) in the video frame.

Figure 1 A Widescreen Image

Figure 2 Image Anamorphically Fitted into a 4:3 Aspect Ratio

The advantage of this is that producers can shoot wide-screen material using inexpensive equipment. The disadvantage of shooting anamorphic video is that everything in the Anamorphic frame looks thin and distorted on a normal monitor unless the image is adjusted, either by software or by pushing the 16:9 button found on high-end broadcast video monitors. This button rescales the video vertically as it is displayed on the monitor, giving it the proper widescreen dimensions.

Remember that 16:9 anamorphic video is supposed to look "squished" on a typical 4:3 monitor. Although this may seem odd, it is the correct behavior. When recording, transferring, editing, and outputting to tape, an anamorphic image should never be permanently rescaled in order to retain the full video resolution of the image for future use, either for display on a widescreen monitor, or for enlarging to film.

Since anamorphic video creates a widescreen experience by stretching a "squished" 4:3 image out to fill a larger area, fewer pixels are rescaled to fit a larger area. The only video format that actually has a larger frame, using more vertical and horizontal pixels to create a wide-screen image, is High-Definition video. High-Definition video is a completely different format, however, and is not covered in this article.

Rescaling anamorphic video in order to see the entire wide screen frame on a standard definition 4:3 monitor is called "letterboxing," and results in the loss of the maximum resolution available in the source footage. A letterboxed frame has two black borders both at the top and at the bottom of the frame (Laserdisc and DVD aficionados will be used to this). You should only letterbox your video when you are finished editing and want to deliver a tape that will look right on consumer equipment.

Figure 3 A 16:9 Letterbox image

Why shoot 16:9 video?

There are three main reasons to shoot 16:9, or anamorphic video:

1. Because it looks neat. Even if you end up letterboxing the eventual output for standard definition televisions, viewers tend to associate the widescreen look with a cinematic feel. A wide screen also allows video-makers more room for creativity in their shot composition.

2. Preparation for transfer to film. Film and video both have different aspect ratios. 35 mm film, with an aspect ratio of 1.85:1, is wider than the standard 4:3 ratio of broadcast video.

Figure 4 Aspect Ratios Compared

Those who shoot standard 4:3 video end up having to crop off the top and bottom of the image in order to resize it to fit the film frame, losing resolution and therefore quality.

Figure 5 Cropping 4:3 Video to Fit into a 1.85:1 Frame

Videomakers shooting 16:9 will be able to make higher resolution transfers by virtue of not having to crop out as many pixels (16:9 is still a bit narrower than the American film standard 1.85:1).

3. Looking to the future. High-Definition video also has an aspect ratio of 16:9. While High-Definition video is not in common use yet, eventually the entire broadcast industry will move to High-Definition video as the standard means of broadcast. Videomakers who want to be able to resize their productions to take advantage of the new frame size of this upcoming standard should shoot 16:9 anamorphic.

How can I acquire Anamorphic Video?

Anamorphic video can be acquired in one of two ways:

1. Using the 16:9 button found on most camcorders. This method, while easy and inexpensive, yields the lowest resolution. What is actually happening is that the camcorder crops off the top and bottom of the screen, then stretches this smaller widescreen image vertically to fit the full 4:3 aspect ratio, thus producing the necessary anamorphic distortion before recording the image to tape. This method is the less desirable of the two as it uses fewer pixels, actually reducing the available resolution, and can result in degradation of the final image. On the other hand, an advantage of this method for those seeking convenience over quality, is that many camcorders embed information in the video signal that indicates whether or not it was recorded in 16:9 mode. Final Cut Pro 1.2.5 can read this information and automatically capture and output it in the correct fashion.

2. The second method involves using an anamophic lens. An anamorphic lens is a wide angle lens that optically distorts the 16:9 image into a 4:3 frame before sending it into your camcorder's CCD (charged coupling device). Because this is done optically, the result is clean, clear, and takes advantage of the full resolution of the DV frame. This method is recommended for users looking for the best possible quality.

How Final Cut Pro 1.2.5 handles 16:9 Video

As of version 1.2.5, Final Cut Pro has the ability to properly display anamorphically captured material at the correct 16:9 aspect ratio directly on your computer display without rendering. Transitions such as the "Oval" and "Star" iris are correctly shaped, and all geometry settings automatically take the 16:9 aspect ratio into account.

The Anamorphic Display information referred to in this section affects playback display on your computer monitor only. It does not affect DV or QuickTime rendering, and it does not alter the resolution of captured QuickTime clips in any way. All DV clips are still captured and output with a frame size of 720x480.

Figure 6 Final Cut Pro with 16:9 DV Clips Loaded Into Both the Viewer and Canvas

Importing Anamorphic 16:9 Clips from Tape

Final Cut Pro gives you a great deal of flexibility when it comes to importing Anamorphic 16:9 material for editing. Some cameras have the ability to embed information regarding the user's selected aspect ratio directly onto the videotape. When a user presses the "16:9 Wide" button on these cameras, the DV stream recorded to tape includes this information, and Final Cut Pro 1.2.5 will automatically detect this and mark the resulting

imported QuickTime clip as Anamorphic 16:9. This will happen regardless of whether or not the "Anamorphic 16:9" button is checked in the "Capture" Preferences tab.

Figure 7 The Anamorphic 16:9 checkbox in the Capture Preference Tab

Those using an Anamorphic Lens to achieve the 16:9 look, as previously described, are actually recording their footage at a 4:3 aspect ratio. As a result, it is not automatically identified as 16:9 material by Final Cut Pro. If you are using an Anamorphic Lens, checking the Anamorphic 16:9 option in the "Capture" Preferences tab marks all subsequently imported clips as Anamorphic 16:9.

Note: With this option turned on, all clips are marked as 16:9 regardless of whether or not they are actually supposed to be, so be careful to deselect this box when recording regular, non-anamorphic 4:3 material.

Switching a clip between Anamorphic 16:9 and Standard 4:3

Once a clip is imported, its aspect ratio can always be changed by going into the item properties for that given clip, and clicking the Anamorphic 16:9 button. This information is available only in Final Cut Pro, and is saved back to a QuickTime file by rendering it out from an appropriately configured sequence with 16:9 either enabled or disabled.

Figure 8 The Anamorphic 16:9 checkbox in the Item Properties Window

Importing Anamorphic 16:9 QuickTime Clips

If you are importing clips already stored on your hard drives, you can have Final Cut Pro 1.2.5 automatically check to see if they are set to a 16:9 aspect ratio by turning on the "16:9 Import Check" button in the "General" Preferences tab. This 16:9 information gets embedded into QuickTime files either by capturing video clips that have it from tape, or by rendering out a sequence set to be 16:9 anamorphic as a QuickTime file.

Figure 9 The 16:9 Import Check checkbox in the General Preferences Tab

Editing with Anamorphic 16:9 Sequences

When editing, the Viewer automatically detects which clips are marked as Anamorphic 16:9 and which are not, and adjusts accordingly. Sequence playback and clips displayed in the Canvas work differently. Sequences that are not set to Anamorphic 16:9 will need to render any 16:9 clips that are edited into them, even though they are displayed properly. To avoid this, always edit 16:9 material into a sequence specifically set to Anamorphic 16:9.

New 16:9 sequences can be created by changing the default preset in the "Sequence Presets" Preferences tab. Final Cut Pro 1.2.5 has additional presets that weren't available in version 1.2 or earlier. To change the default Preset for new sequences:

1. Select a new preset from the list shown in the "Sequence Presets" tab
2. Click the "Set Default" button
3. Click the "OK" button

Notice that the new default sequence has an icon indicating this to the left of it in the list. Any new sequences created are now created with these settings.

Figure 10 The NTSC and PAL 16:9 DV Presets (the Default 4:3 preset is shown on top)

Existing Sequences with no clips edited into them can be switched to 16:9 by opening up the Sequence Settings window. This is done by selecting the sequence to be modified and either selecting the Sequence>Settings menu item, or Control + Clicking the sequence icon to bring up the contextual menu, which also has a Sequence Settings menu item. Once the Sequence Settings window is open, Anamorphic 16:9 can be enabled or disabled through a checkbox.

Note: This should only be done prior to adding any 16:9 clips. If a 16:9 clip is edited into a 4:3 sequence, it will display properly but require rendering. If that sequence is then changed to 16:9 without first removing the edited clip, the clip will not look correct.

Figure 11 The Anamorphic 16:9 checkbox in the Sequence Settings

Exporting Anamorphic Video to Tape

When outputting an edited sequence using anamorphic video to tape, you have two choices, depending on what kind equipment you want to play back from:

1. You can simply output it as is, looking "squished" on a 4:3 monitor. This is the preferable option if you're planning on playing back your video on hardware that will compensate for the proper aspect ratio or if you're planning on transferring to film. High-end broadcast monitors can rescale for 16:9 at the push of a button, and some specialty widescreen monitors popular with home theater enthusiasts will do this as well.

2. If you're unsure who is going to be viewing the tape and you want undistorted playback on a standard 4:3 monitor, you can manually letterbox your video. This will require rendering your entire edited sequence, so allocate some time for this process. To letterbox your edited sequence:

   a) Open the 16:9 sequence in the Timeline.

   b) Create a new sequence that is not 16:9 anamorphic and open it in the Timeline.

   c) Drag the 16:9 sequence's icon from the Browser to the Overwrite area of the Edit Overlay in the Canvas.

   d) Render the new sequence, then print it to tape.

Exporting Anamorphic Video to QuickTime

Instead of outputting to tape, users may also render a QuickTime movie with a rectangular, 16:9 framesize. For examples of 16:9 framesize, see some of the movie trailers at http://www.quicktime.com/trailers/ . To export your edited sequence with a 16:9 rectangular frame size:

1. Choose "Export" from the File menu and "QuickTime" from the submenu.

2. Click the "Options" button

3. In the Video section, click "Size," then click "Use Custom Size"

4. Enter values for the width and height so the desired height is 9/16 of the desired width (to determine this value, multiply the width by 0.5625), then click OK.

Two example frame sizes using this ratio are:

   a) If you are exporting from the native DV-NTSC frame size of 720 x 480, set the output frame size to be 720 x 405.

   b) An example of a smaller 16:9 frame size would be 400 x 225

Further Resources

The following manufacturers supply anamporphic lenses. See their websites for more information about lens adaptors for your individual camera:

Open Transport: TCP/IP Configuration

This article provides information for configuring Open Transport TCP/IP.
This article has been archived and is no longer updated by Apple.
Open Transport/TCP works over, but is not limited to, Ethernet, Token Ring, and AppleTalk (as MacIP). It also works over serial lines when using backward compatible MDEV support (for example, MacPPP and InterSLIP).

Open Transport/TCP is configured using the TCP/IP Control Panel. Configuration may be done manually, or through a BOOTP, DHCP, RARP, or MacIP server. The steps to follow using each of these methods are detailed below.

By default, the TCP/IP Control Panel comes up in basic mode. Advanced or administration mode may be entered via the Edit menu. These modes allow expert users additional choices as well as the ability to augment information returned from a configuration server or to fill in gaps in the returned information.

The TCP/IP Control Panel may be used at any time to reconfigure the system. However TCP will not notice the new configuration until it has unloaded from the system. By default, this takes about 2 minutes after the last application using TCP or UDP has gone away.

Figure 1: Open Transport TCP/IP control panel in Advanced mode.

Description of the fields in the TCP/IP Control Panel

Figure 1, above, shows the Open Transport TCP/IP control panel in the Advanced mode.

Connect via

This is where you select the interface the system is going to use. This can include, but is not limited to, Ethernet, Token Ring, AppleTalk (MacIP), and MacPPP.

Configure

This is where you select how the system will obtain its IP address. The choices are Manually, BootP, DHCP, and RARP.

IP Address

This is where you enter the systems IP address if you have configured it to obtain its address manually. If BootP, DHCP, or RARP were selected for the "Configure:" field, the text "<supplied by server>" will be displayed.

Domain name

This is the default domain name used for domain name searches. For example, if a domain name of "apple.com" is configured, a search for "scott" would initially search for "scott.apple.com." It is not always necessary to fill in this field when configuring from a BootP or DHCP server since it may be returned along with the IP address. It is not necessary to have a domain name entered in this field.

Admin domain

In Advanced User mode only, you may enter an Admin Domain. This is used to allow implicit searches. For example, if my domain is tech.support.apple.com, and my admin domain is set to apple.com, a search for the name "scott" would first look for scott.tech.support.apple.com, then for scott.support.apple.com, then for scott.apple.com. Implicit searching will not be done unless an Admin Domain is explicitly setup and the default domain is a subdomain of the Admin Domain (per RFC 1535). If the name "scott" is not found here and Search domains are present, they are searched as well.

Search domain names

In Advanced User mode only, you may enter Search domains. See the "Domain Name Resolver Information" for complete details on how searching and the DNR work.

Domain Name Resolver Information

When a client of the DNR requests a name-to-address mapping, the DNR checks for a "." at the end of the name. If it exists, the name is assumed to be fully qualified (see RFCs 1034 and 1035 for an explanation of the Domain Name System). Otherwise, if the name contains at least one "." internally, it is considered to be provisionally fully qualified. Otherwise, the name is assumed to be partially qualified, and the DNR will begin a search for that name in the domain name in the "Domain name:" field. If it is not found there, and there is an Admin domain configured, implicit

searches will take place as described in the "Admin domain" section. If the name is still not found, the Search domains are searched. For each search domain, the configured name servers are contacted in the order specified. If the name is resolved in the first search domain, that answer is returned. If an authoritative answer that the "name-does-not-exist" is returned, the DNR begins the search in the next configured search domain. The search continues through the domains, and if no match is found, the DNR will search the root domain if it makes sense to do so. The DNR has an overall timeout of 2 minutes after which it will abandon its search.

Subnet mask

This is for the subnet mask for the network the system is connected. For example, on a class C net which uses 4 bits of the host field for subnetting, the subnet mask should be entered as "255.255.255.240".

Router address

This is for the IP address of the default IP router located on the network the system is on.

Name server addr

This is for the IP address(es) of one or more Domain Name Servers.

Configuring Open Transport/TCP

Manual Configuration

To manually setup Open Transport/TCP, follow these steps:

1. Select the interface to use, or pick "AppleTalk (MacIP)" to run over AppleTalk on the interface selected in the AppleTalk control panel.

2. If an Ethernet interface is selected, a check box will appear offering the use of 802.3. By default, Open Transport/TCP uses Ethernet_II rather than 802.3.

3. Select "Manually" as the configuration method.

4. Fill in the IP address in dot notation (for example, 128.1.1.1).

5. Fill in the default domain extension to be used on name searches.

6. In Advanced User mode only, you may enter an Admin Domain. This is used to allow implicit searches.

7. Fill in the subnet mask in dot notation.

8. Fill in the IP address of the default IP router.

9. Fill in the IP address(es) of one or more Domain Name Servers.

10. In Advanced User mode only, additional search domains may be entered. See the preceding description of the Domain Name Resolver operation for details.

11. If a Hosts file is required, select it using the Hosts file button. For details about the Hosts file, see the description which follows.

DHCP Configuration

To use a DHCP server to setup Open Transport/TCP, follow these steps:

1. Select the interface to use in the AppleTalk control panel.

2. If an Ethernet interface is selected, a check box will appear offering the use of 802.3. By default, Open Transport/TCP uses Ethernet_II rather than 802.3.

3. Select "Using DHCP" as the configuration method.

4. In Advanced User mode only, you may enter an Admin Domain. This is used to allow implicit searches.

5. In Advanced User mode, a subnet mask may be entered but is not required. If a value is entered, it will be used if no subnet mask is returned from the DHCP server. Otherwise, any value entered is ignored.

6. In Advanced User mode, the manually entered IP addresses of routers are attached to the end of the possibly empty) list of IP routers returned by the DHCP server.

7. In Advanced User mode, the manually entered IP addresses of Domain Name Servers are attached to the end of the (possibly empty) list of Name Servers returned by the DHCP server.

8. In Advanced User mode only, additional search domains may be entered. See the preceding description of the Domain Name Resolver operation for details.

9. If a Hosts file is required, select it using the Hosts file button. For details about the Hosts file, see the description which follows.

DHCP Address Leases

DHCP provides a network administrator with the ability to configure a host's IP address either for an unlimited or for a limited period of time. The limited lease period is under the network administrator's control and is non-negotiable. Leases may, however, be renewed at the option of the configuring server.

Open Transport/TCP fully supports DHCP address leases. Should an interface's IP address lease expire, the interface will be closed down. However, Open Transport/TCP will automatically attempt to renew any address lease that reaches it's Renewal Interval, which defaults to half of the lease's lifetime, but may be configured to a different interval by the configuring server. Renewal will be attempted regardless of how many times the lease has already been renewed.

BootP Configuration

To use a BootP server to setup Open Transport/TCP, follow these steps:

1. Select the interface to use, or pick "AppleTalk (MacIP)" to run over AppleTalk on the interface selected in the AppleTalk control panel.

2. If an Ethernet interface is selected, a check box will appear offering the use of 802.3. By default, Open Transport/TCP uses Ethernet_II rather than 802.3.

3. Select "Using BootP " as the configuration method.

4. In Advanced User mode only, you may enter an Admin Domain. This is used to allow implicit searches.

5. In Advanced User mode, a subnet mask may be entered but is not required. If a value is entered, it will be used if no subnet mask is returned from the BOOTP server. Otherwise, any value entered is ignored.

6. In Advanced User mode, the manually entered IP address of the router is attached to the end of the (possibly empty) list of IP routers returned by the DHCP server.

7. In Advanced User mode, the manually entered IP addresses of Domain Name Servers are attached to the end of the (possibly empty) list of Name Servers returned by the DHCP server.

8. In Advanced User mode only, additional search domains may be entered. See the preceding description of the Domain Name Resolver operation for details.

9. If a Hosts file is required, select it using the Hosts file button. For details about the Hosts file, see the description which follows.

RARP Configuration

To use a RARP server to setup Open Transport/TCP, follow these steps:

1. Select the interface to use, or pick "AppleTalk (MacIP)" to run over AppleTalk on the interface selected in the AppleTalk control panel.

2. If an Ethernet interface is selected, a check box will appear offering the use of 802.3. By default, Open Transport/TCP uses Ethernet_II rather than 802.3.

3. Select "Using RARP" as the configuration method.

4. Fill in the default domain extension to be used on name searches.

5. In Advanced User mode only, you may enter an Admin Domain. This is used to allow implicit searches.

6. Fill in the subnet mask in dot notation.

7. Fill in the IP address of the IP router.

8. Fill in the IP address(es) of one or more Domain Name Servers.

9. In Advanced User mode only, additional search domains may be entered. See the preceding description of the Domain Name Resolver operation for details.

10. If a Hosts file is required, select it using the Hosts file button. For details about the Hosts file, see the description which follows.

MacIP Server Configuration

To use a MacIP Server to setup Open Transport/TCP, follow these steps:

1. Select "AppleTalk (MacIP)" as the interface to use. TCP will now run over AppleTalk on the interface selected in the AppleTalk control panel.

2. Select "Using MacIP Server" as the configuration method.

3. Select the zone the DDP/IP Gateway is in using the "Select Zone ╔" button.

4. Fill in the default domain extension to be used on name searches.

5. In Advanced User mode only, you may enter an Admin Domain. This is used to allow implicit searches.

6. If a Hosts file is required, select it using the Hosts file button. For details about the Hosts file, see the description which follows.

Hosts File

Open Transport/TCP supports a Hosts file that may be used to supplement and/or customize the Domain Name Resolver's initial cache of information. The Hosts file is found in the System's Preferences folder. This file is parsed when Open Transport/TCP is initialized. As in MacTCP, the supported Hosts file features follow a subset of the Domain Name System Master File Format (see RFC 1035 page 33).

Supported features include blank lines, comments (indicated by a semicolon), and data entry. Comments may begin at any location in a line; they may follow data entry on the same line. A comment extends from the semicolon to the end of the line. Data entry must follow the format:

```
<domain><rr>[<comment>]
```

where is an absolute or Fully Qualified domain name (which, however, need not be terminated by a dot, but must contain at least one dot internally) and where

```
<rr>=[<ttl>][<class>]<type><rdata> OR [<class>][<ttl>]<type><rdata>
```

The only class currently supported is IN (Internet Domain); ttl (time to live; indicates the record's configured lifetime) is in seconds; and type can be A (host address), CNAME (canonical name of an alias), or NS (name server). If ttl is not present the entry is assumed to have an infinite lifetime; this may also be indicated by specifying a ttl of minus-one (-1).

$INCLUDE and $ORIGIN are not supported.

Examples of valid data entry lines including comments:

apple.com	A	130.43.2.2	; address of host apple.com
foobar	CNAME	barfoo.apple.com	; canonical name for the host
			; whose local alias is "foobar"
mit.edu	86400 NS	achilles.mit.edu	; name server for mit.edu domain,
			; entry has a one-week lifetime

Open Transport/TCP's Hosts file support is somewhat more stringent than that of MacTCP. MacTCP permitted violation of the Fully Qualified requirement for <domain-name>, and this feature was often used to avoid the necessity for entering CNAME records by associating an address directly with a non-fully qualified name. For instance, this format:

charlie A 128.1.1.1

which was acceptable to the MacTCP DNR, is no longer permitted because of the use of domain search lists in Open Transport/TCP (charlie could potentially exist in any or all of the configured domains). If such a line exists in your hosts file, kOTBadNameError will be returned when the Hosts file is read. To accomplish the same effect, use this format instead:

charlie CNAME myhost.mydomain.edu
myhost.mydomain.edu A 128.1.1.1

This associates the local alias "charlie" with the fully qualified domain name "myhost.mydomain.edu" and resolves it to the address 128.1.1.1. Use of local aliases is limited to CNAME entries; NS and A entries must use fully qualified domain names.

In general, use of the Hosts file is discouraged, as it often simply wastes memory by permanently configuring data that may only rarely be accessed. It is also highly susceptible to misuse by users who try to configure far too much information internally in order to avoid accessing DNS servers. Besides tying up memory, this practice is exactly the reason that the Domain Name System was developed in the first place - to eliminate the performance degradation caused by use of enormous hosts files.

Should a Hosts file be used, every effort should be made to keep it as small as possible and to only include entries that will be accessed frequently.

Power Mac G4 (Gigabit Ethernet): Computer Display Is Blank

The AGP video card in the Power Mac G4 (Gigabit Ethernet) computer may move slightly out of its slot during shipping, causing the screen to remain blank when the computer is turned on. This article explains how to reinsert the card to correct this issue.
This article has been archived and is no longer updated by Apple.

Symptom

The computer and display are turned on, but the screen is blank.

Product affected

- Power Mac G4 (Gigabit Ethernet)

Solution

Sometimes during shipping the AGP video card may move slightly out of its slot, causing the display to remain blank when turned on. To correct this, the card needs to be pressed firmly back into the AGP video slot.

Warning: Read and follow the ESD precautions outlined in the "Working Inside Your Computer" section of the "Setting Up Your Power Mac G4" owner's manual.

To reinsert the video card into its slot, follow these steps:

1. Shut down the computer.
2. Open the computer by pulling on the latch.

Figure 1 Latch location

3. Press down evenly on the video card in the AGP slot to make sure it is completely inserted.

Figure 2 Reinserting the card

4. Close the computer.

Note: A QuickTime movie showing the replacement of the video card is available at http://www.info.apple.com/installparts/. This movie may provide you with additional help in locating and reinserting the AGP video card.

Other steps to try

1. Verify the display's video cable is securely connected to the video card.
2. Verify the display is turned on.
3. Verify the display cable or the monitor power cord is plugged in to the monitor and a working power outlet.

If the symptom persists, contact an Apple Authorized Service Provider or Apple for further assistance.

Apple Display Packaging Instructions

This article explains how to pack and send your display to Apple for repair.

Note: These steps should only be used once an Apple representative has provided you with authorization to send in your display for repair.

This article has been archived and is no longer updated by Apple.

Paperwork

A form is included in the express shipping package, which should contain the symptom your display exhibits. If a form is not in the express shipping package, write the symptom on a sheet of paper, and include it with the display.

By filling out this form, our technicians can more accurately identify and repair the display.

Apple Display

1. Place the display and form in the express delivery package.
Packaging instructions for the Apple Studio Display and the Apple Cinema Display are available at:

http://www.info.apple.com/support/packing/index.html

All Instructions are in PDF format. Some are also available as QuickTime movies.

2. Return the air-bill included with the express delivery package.
This step is critical. You must return the air-bill so Apple can track the shipment, and make sure it safely arrives at the repair center.

3. **U.S. customers**: Call FedEx (1-800-GO FED EX) to pick up your display.
Canadian customers: Call UPS at 1-866-876-5824 to get a waybill and schedule pick-up of the product. Provide the return address and billing account number:

Apple
7495 Birchmount Rd.
Markham, ON L3R 5G2
Account No: 0078R5

Important: The UPS waybill must include the account number, the dispatch number in the Description field, and you must mark "3rd Party" under the Payment field.

Please allow seven to ten days to complete the repair.

WebObjects 4.5 Oracle Adaptor: Reconnecting After an Oracle Connection Failure

This article describes how to get WebObjects 4.5 Oracle Adaptor to recognize additional error codes, other than the standard six, so that it can detect a connection failure.
This article has been archived and is no longer updated by Apple.

Symptom

The automatic database reconnection feature in WebObjects 4.5 fails to reconnect a client to the host Oracle database.

Solution

There are only six predefined Oracle error codes recognized by WebObjects as connection failures. When any Oracle error code other than these six occurs, the OracleAdaptor method isDroppedConnectionException returns NO/False. By default, when isDroppedConnectionException returns NO, no reconnection is attempted, and the original exception is raised as usual.

For additional error codes to be recognized, they need to be added to the WebObjects Framework and recompiled.

Recognized Oracle Error codes

1. ORA-00028: your session has been killed
2. ORA-00030: user session ID does not exist
3. ORA-00051: time-out occurred while waiting for resource
4. ORA-00060: deadlock detected while waiting for resource
5. ORA-00099: timed out while waiting for resource, potential PDML deadlock
6. ORA-01012: not logged on

Additional information on Oracle error codes is available in Oracle documentation.

Adding Additional Error Codes

To change the default behavior, include this Objective C category to your project, and add the error code. Once the error code is added, Enterprise Object Framework (EOF) will attempt an automatic reconnection.

You must add the `OracleEOAdaptor.framework` to the list of frameworks in your project to recompile your project successfully.

```
------File OracleConnectionErrorAdditions.m----------------

#include <OracleEOAdaptor/OracleAdaptor.h>

@implementation
OracleAdaptor(OracleConnectionErrorAdditions)

- (BOOL)isDroppedConnectionException:(NSException
*)exception
{
   NSDictionary *userInfo = [exception userInfo];
   if (userInfo) {
       int errCode = [[userInfo
objectForKey:OracleErrorKey] intValue];
       // 00028 session killed
       // 00030 user session no longer exists
       // 00051 time out
       // 00060 deadlock
       // 00099 PDML deadlock
       // 01012 not logged on
       switch (errCode) {
           case 28:
```

```
            case 30:
            case 51:
            case 60:
            case 1012:
            case 99:
        // ADD YOUR ERROR CODE HERE. FOR EXAMPLE ORA-01041:
                  //     ORA-01041: internal error. HOSTDEF extension
does not exist

            case 1041:
                return YES;
                // Yes, the exception comes from a dropped connection
            default:
                return NO;
                // adaptor should NOT try to reconnect, and should re-raise the exception

        }
    }
    return NO;
}
@end
```

AppleWorks 6: Locating Newsletter Templates

Creating and locating newsletter templates for AppleWorks 6 has changed from previous versions. Learn where to find newsletter templates.
This article has been archived and is no longer updated by Apple.
In AppleWorks 5 an assistant and stationary item helped in the creation of newsletters. In AppleWorks 6, no newsletter templates are shown when looking at the AppleWorks Templates available in Starting Points.

Additional templates are available from Apple through the Internet including newsletter templates.

Downloading New Templates

1. Connect to the Internet.
2. Open AppleWorks, click the Web tab in the Starting Points window.
3. Click the templates icon.

A window appears with a list of available template types. These include Just for Kids, Special Occasions, For Schools, For Home, For Business, For everyone, and AppleWorks Users Group. Newsletter templates are specifically available in the Just for Kids and For Schools areas.

Additional newsletter templates are available from the AppleWorks Educators' Resources Web site.

http://www.apple.com/education/k12/products/appleworks/ .

English

About Disk First Aid 8.6.1

Disk First Aid is a utility that verifies and repairs some problems that may occur on Mac OS Extended format hard disk drives.

Use Disk First Aid if you have any of these problems with a Mac OS Extended format disk:

- When you attempt to install some software from other manufacturers, a message says incorrectly that the disk or volume is locked.
- Some file backup utilities don't recognize the disk or volume.
- You can't start up from a disk because it is extremely fragmented.

System Requirements

Disk First Aid 8.6.1 is intended for PowerPC-based Macintosh computers using the U.S. English version of Mac OS 9.x or later.

Disk First Aid 8.6.1 Enhancements

This version of Disk First Aid repairs certain types of master directory block damage on Mac OS Extended format volumes. The previous version of Disk First Aid identifies the issue but doesn't repair the damage.

Disk First Aid 8.6.1 also improves the compatibility of Mac OS Extended format hard disks with Mac OS X.

This version of Disk First Aid can repair more kinds of problems on a startup hard disk. However, Apple recommends that you start your computer from a different disk (such as a CD or floppy disk) before repairing the startup disk.

Frequently Asked Questions about Disk First Aid 8.6.1

- **Why does my desktop disappear when Disk First Aid 8.6.1 is running?**

  To repair some hard disks safely, Disk First Aid quits all applications, including the Finder. Once the repair is complete, you can quit Disk First Aid to see the desktop.

- **How do I know a hard disk is Mac OS Extended format?**

  Select the hard disk in the Finder and choose Get Info from the File menu. The format information specifies Mac OS Standard or Mac OS Extended.

- **Should I reformat my hard disk after repairing with Disk First Aid?**

  Usually this is not necessary. However, if the hard disk was damaged by an incompatible disk repair utility, Apple recommends that you reformat or initialize the hard disk to ensure the directory structure is not damaged.

  IMPORTANT: initializing erases all the data on the hard disk. Back up your important files first.

  When initializing, choose the low-level format option only if a regular format fails. Use the "zero all data" option only if you have security concerns and you want all traces of previous data removed from the hard disk. These options take longer than the regular format option.

- **Can I use my other disk utilities with a Mac OS Extended format hard disk?**

  Some disk utilities may not be compatible with Mac OS Extended format. Before you use a disk utility with a Mac OS Extended hard disk, please consult the documentation for the utility or contact the vendor for compatibility information.

franÃ§ais

Ã propos de S.O.S. Disque 8.6.1

S.O.S. Disque est un utilitaire qui vÃ©rifie et rÃ©pare certains problÃ¨mes pouvant survenir sur les disques durs au format Mac OS Ã©tendu.

Utilisez S.O.S. Disque si vous rencontrez l'un des problÃ¨mes suivants avec un disque dur au format Mac OS Ã©tendu :

- Lorsque vous essayez d'installer certains logiciels d'autres fabricants, un message indique de faÃ§on erronÃ©e que le disque ou volume est verrouillÃ©.
- Certains utilitaires de sauvegarde ne reconnaissent pas le disque ou volume.
- Vous ne pouvez pas dÃ©marrer un disque car il est trÃ¨s fragmentÃ©.

SystÃ¨me requis

S.O.S. Disque 8.6.1 est destinÃ© aux ordinateurs Macintosh PowerPC fonctionnant avec la version franÃ§aise de Mac OS 9.0.4 ou ultÃ©rieure.

AmÃ©liorations de S.O.S. Disque 8.6.1

Cette version de S.O.S. Disque rÃ©pare certains types de dommages du bloc dans le rÃ©pertoire principal sur des volumes Mac OS Ã©tendu. La version prÃ©cÃ©dente de S.O.S. Disque identifie le problÃ¨me mais ne permet pas de le rÃ©parer.

En outre, S.O.S. Disque 8.6.1 amÃ©liore la compatibilitÃ© des disques durs Mac OS Ã©tendu avec Mac OS X.

Bien que cette version de S.O.S. Disque 8.6 puisse rÃ©parer davantage de problÃ¨mes sur un disque de dÃ©marrage, Apple vous recommande de dÃ©marrer votre ordinateur Ã partir d'un disque distinct, tel qu'un CD ou une disquette, avant de rÃ©parer le disque de dÃ©marrage.

Questions frÃ©quemment posÃ©es Ã propos de S.O.S. Disque 8.6.1

- Pourquoi le bureau disparaÃ®t-il pendant le fonctionnement de S.O.S Disque 8.6.1 ?
  Pour rÃ©parer certains disques durs, S.O.S. Disque quitte toutes les applications, y compris le Finder. Une fois la rÃ©paration terminÃ©e, il suffit de quitter S.O.S. Disque pour faire rÃ©apparaÃ®tre le bureau.
- Comment reconnaÃ®tre un disque dur au format Mac OS Ã©tendu ?
  SÃ©lectionnez le disque dur dans le Finder, puis choisissez Lire les informations dans le menu Fichier. Les informations indiquent soit Mac OS standard, soit Mac OS Ã©tendu.
- Faut-il reformater un disque dur aprÃ¨s l'avoir rÃ©parÃ© Ã l'aide de S.O.S Disque ?
  Cela n'est en gÃ©nÃ©ral pas nÃ©cessaire. Toutefois, si le disque dur a Ã©tÃ© endommagÃ© par un utilitaire de rÃ©paration non compatible, Apple vous recommande de reformater ou de rÃ©initialiser ce disque afin de vous assurer que la structure de rÃ©pertoire n'est pas endommagÃ©e.

  IMPORTANT : l'initialisation efface toutes les donnÃ©es du disque ; sauvegardez prÃ©alablement tous vos fichiers.

Lors de l'initialisation, ne choisissez l'option de formatage de bas niveau qu'en cas d'Ã©chec du formatage normal. N'utilisez l'option "donnÃ©es Ã zÃ©ro" que si vous souhaitez, par mesure de sÃ©curitÃ©, effacer toutes traces des donnÃ©es antÃ©rieures. Ces options requiÃ¨rent plus de temps que les options normales.

- Puis-je utiliser d'autres utilitaires avec un disque au format Mac OS Ã©tendu ?
  Certains utilitaires de disque peuvent s'avÃ©rer incompatibles avec le format Mac OS Ã©tendu. Avant d'employer un utilitaire de disque avec un disque dur Mac OS Ã©tendu, veuillez consulter la documentation de l'utilitaire ou contacter le vendeur au sujet des informations de compatibilitÃ©.

Deutsch

Ãber Erste Hilfe 8.6.1

Erste Hilfe ist ein Dienstprogramm, das Probleme vom Volumes im Mac OS Extended Format Ã¼berprÃ¼ft und repariert.

Benutzen Sie Erste Hilfe, falls bei Ihnen eines der folgenden Probleme auftritt:

- WÃ¤hrend der Installation der Software eines anderen Herstellers erscheint fÃ¤lschlicherweise eine Meldung, daÃ das Zielvolume geschÃ¼tzt ist.
- Manche Backup-Programme erkennen die Festplatte oder ein Volume nicht.
- Sie kÃ¶nnen von einem Volume nicht starten, da es stark fragmentiert ist.

Systemvoraussetzungen

Erste Hilfe 8.6.1 ist fÃ¼r Macintosh Computer mit PowerPC Prozessor, die Mac OS 9.0.4 oder neuer benutzen.

Verbesserungen in Erste Hilfe 8.6.1

Diese Version von Erste Hilfe behebt verschiedene Probleme des Master Directory Blocks auf Mac OS Extended Volumes. FrÃ¼here Versionen von Erste Hilfe erkennen dieses Problem, kÃ¶nnen es aber nicht reparieren.

Erste Hilfe 8.6.1 verbessert auch die KompatibilitÃ¤t von Volumes im Mac OS Extended Format mit Mac OS X.

Diese Version von Erste Hilfe kann eine grÃ¶Ãere Anzahl an Problemen mit Startvolumes lÃ¶sen. Bevor Sie jedoch die Reparatur Ihres Startvolumes beginnen, sollten Sie Ihren Computer von einem anderen Volume starten (z.B. CD oder Diskette).

HÃ¤ufig gestellte Fragen Ã¼ber Erste Hilfe 8.6.1

- Warum verschwindet mein Schreibtisch, solange Erste Hilfe 8.6.1 lÃ¤uft?
  Um Volumes sicher zu reparieren, muÃ Erste Hilfe alle Programme inklusive dem Finder beenden. Wenn die Reparatur abgeschlossen ist, kÃ¶nnen Sie Erste Hilfe beenden, um den Schreibtisch zu sehen.
- Woher weiÃ ich, ob ein Volume im Mac OS Extended Format ist?
  WÃ¤hlen Sie im Finder das Volume aus und anschlieÃend im MenÃ¼ "Ablage" den Befehl "Information". Im Informationsfenster wird als Format entweder Mac OS Standard oder Mac OS Extended angezeigt.
- Sollte ich meine Festplatte neu formatieren, nachdem ich sie mit Erste Hilfe repariert habe?
  Normalerweise ist dies nicht notwendig. Wenn jedoch die Festplatte von einem nicht kompatiblen Programm fÃ¼r die Reparatur von Festplatten beschÃ¤digt wurde, sollten Sie die Festplatte neu formatieren oder initialisieren, um auszuschlieÃen, daÃ die Verzeichnisstruktur beschÃ¤digt wurde.

  WICHTIG: Beim Initialisieren werden alle Daten auf Ihrer Festplatte gelÃ¶scht, daher sollten Sie zuerst eine Sicherungskopie aller wichtigen Dateien erstellen.

  WÃ¤hlen Sie bitte nur dann die Option "Speichermedium formatieren" aus, wenn das normale Formatieren nicht funktioniert. WÃ¤hlen Sie nur dann die Option "Volumes mit Leerdaten Ã¼berschreiben", wenn Sie Sicherheitsbedenken haben und Sie alle Spuren der vorherigen Daten von Ihrer Festplatte lÃ¶schen mÃ¶chten. Diese Optionen benÃ¶tigen mehr Zeit als die normalen Formatierungsoptionen.
- Kann ich meine anderen Dienstprogramme fÃ¼r Festplatten mit Volumes im Mac OS Extended Format benutzen?
  Einige Dienstprogramme fÃ¼r Festplatten sind mÃ¶glicherweise nicht mit dem Mac OS Extended Format kompatibel. Bevor Sie ein Dienstprogramm fÃ¼r Festplatten mit einem Volume im Mac OS Extended Format benutzen, lesen Sie bitte die dazugehÃ¶rige Dokumentation oder wenden Sie sich an den HÃ¤ndler, um Informationen zur KompatibilitÃ¤t zu erhalten.

iMac/Cube DVD-ROM Update: Additional Installation Messages

This article includes additional messages that could appear during the installation of the iMac/Cube DVD-ROM Update.

This article has been archived and is no longer updated by Apple.

Symptom

In the "About iMac/Cube DVD-ROM Update" document included in the DVD-ROM Update, only two possible installation messages are mentioned. However, there are eight messages that could appear during the installation process.

Solution

Messages that might appear are listed below.

Different version of Mac OS installed on computer than what is required for update:

- This DVD-ROM Update requires a US-version or an international English version Mac OS. Please choose a different destination disk, or perform a clean installation of a US-version Mac OS.

  Note: The message above appears in the US version of the DVD-ROM Update. Other localize languages have similar messages when the DVD-ROM Update version does not match the Mac OS version.
- This DVD-ROM Update requires a minimum of Mac OS 9.0.4 on the destination disk.

Different model of DVD-ROM drive installed than what is required for update:

- This DVD-ROM Update requires a supported DVD-ROM drive.
- This drive is not available on this system.

Macintosh model is not one requiring the DVD-ROM Update.

- This DVD-ROM Update requires a supported iMac or G4 Cube with a DVD-ROM drive.

DVD-ROM drive does not need to be updated, or has already been updated:

- This drive does not need this update.
- This drive has already been updated.

  Note: Both of these messages are documented in the "About iMac/Cube DVD-ROM Update" document.

Drive Error Message:

- This DVD-ROM drive is not able to be updated. Please contact an Apple Authorized Service Provider.

WebObjects: WebObjects 4.5.1 Post-Installation Instructions

This document describes a number of procedures that should be followed after installing WebObjects 4.5.1 on specific platforms.

Note: This document has been superseded by **WebObjects 4.5.1 Update 2**, which includes all the fixes described below for both Mac OS X 10.0 and later and HP-UX.

This article has been archived and is no longer updated by Apple.

Mac OS X

Important: You must install WebObjects on the same partition that holds your Mac OS X installation. If you do not, WebObjects will not function properly.

There are several issues that are specific to WebObjects 4.5.1 for Mac OS X that arose after the completion of the initial release. Please read through the following discussion so that it is clear what needs to be done to complete your WebObjects 4.5.1 installation on this platform.

In the WebObjectsDeploy_Install.pdf and WebObjectsDev_Install.pdf Installation Guides on the WebObjects 4.5.1 for Mac OS X CD, reference is made to "Mac OS X Server 1.3". The version number is incorrect, and actually refers to Mac OS X Server 10.0.

After installing WebObjects 4.5.1 Developer for Mac OS X, you should download and install **WebObjects 4.5.1 Update 1**. This update is not needed on a Deployment system.

The WebObjects 4.5.1 Update 1 will

1. create the file /System/Library/WebObjects/Configuration/WebServerConfig.plist, which is needed to do a "split install" of your WebObjects application from ProjectBuilderWO on a developer system.

2. update precompiled headers.

3. create the missing documentation links mentioned in the Readme.rtf on the CD. Once this has been done, you can access WebObjects documentation by launching WebObjects Builder and selecting "WebObjects Builder Help" from the Help menu. Help Viewer will then launch and display a page similar to the main page of WOInfoCenter with links to the WebObjects developer's guide, tutorials, reference documentation, release notes, and more. If you prefer to read the documentation in your web browser, you can also access the same page at `/Developer/Documentation/WebObjects/WOHomePage.html`.

HP-UX

Two HP-UX specific problems in the WebObjects adaptors have been discovered in the WebObjects 4.5.1 release. These problems will only affect your deployment if you are running your web server on an HP-UX machine. If you use an HP-UX application server with the web server (and WebObjects adaptor) on another platform, you will not encounter these problems.

The changes required to fix these issues are detailed below. Customers using an HP-UX web server can make these changes and rebuild the WebObjects adaptors to work around these problems. Additionally, new adaptor binaries incorporating these changes will be distributed in a forthcoming WebObjects 4.5.1 update.

1. The adaptor will not talk to wotaskd or application instances.
(Apple reference #2676773) The solution is to replace the original line 62 of Adaptor/nbsocket.c

```
#define WA_wouldBlock(error) (error == EWOULDBLOCK)
```

with the following line

```
#define WA_wouldBlock(error) (error == EWOULDBLOCK || error == EAGAIN)
```

2. The adaptor does not do name lookups properly. (Apple reference #2678427) The solution is to replace the original lines 289 and 290 of Adaptor/hostlookup.c

```
host = (gethostbyname(name) == 0) ?
      &__host : NULL;
```

with the following single line

```
host = gethostbyname(name);
```

After making both of the above changes to the adaptor source, you will need to rebuild and reinstall the adaptor binaries. See `$NEXT_ROOT/Developer/Examples/WebObjects/Source/Adaptors/BuildingInstructions.html` and `$NEXT_ROOT/Developer/Examples/WebObjects/Source/Adaptors/InstallationInstructions.html` for instructions on how to do this.

WebObjects 5: How to Use Oracle JDBC drivers

This document describes the Oracle JDBC drivers and how to use them with WebObjects 5.
This article has been archived and is no longer updated by Apple.

Applicable products

- WebObjects 5.0
- WebObjects 5.1
- WebObjects 5.2
- WebObjects 5.3

Types of JDBC Drivers

Only the thin JDBC driver has been qualified for Mac OS X, Windows 2000, and Solaris.

WebObjects 5.0 and WebObjects 5.1

- Oracle Thin JDBC driver 8.1.7.0.0

WebObjects 5.2

- Oracle Thin JDBC driver 8.1.7.0.0
- Oracle Thin JDBC driver 9.2.0.1.0

WebObjects 5.3

- Oracle Thin JDBC Driver 10.1.0.x

See technical document 72598 "**WebObjects Compatibility Guide**" for all other database JDBC support.

Where to Obtain Oracle JDBC Drivers

The Oracle JDBC drivers are available from Oracle's website (http://otn.oracle.com/software/content.html). You need an Oracle technet account to download the drivers. (You can set up an account on Oracle's website for free.)

Windows 2000

Download the thin JDBC drivers for both JDK 1.3.x and JDK 1.1.x.

The files are:

- For JDK 1.1.x , the thin driver is: **classes111.zip**
- For JDK 1.3.x, the thin driver is: **classes12.zip**

Mac OS X

Mac OS X 10.0.x

- Download the Oracle 8i 8.1.7 JDBC thin driver for Solaris (JDK 1.2.x only)(classes 12.zip).

Mac OS X 10.2

- Follow the instructions from the Oracle download site to download either the Oracle 8i or Oracle 9i thin JDBC driver for Mac OS X 10.2.

Please note that you should use the Oracle 9i thin JDBC driver when accessing the Oracle 9i database to avoid the possible ORA-00600 error.

Mac OS X 10.4

Follow the instructions from the Oracle download site to download the Oracle 10 g thin JDBC driver for JDK 1.4 (ojdbc14.jar).

Solaris 2.8

- Follow the instructions from the Oracle download site to download either the Oracle 8i or Oracle 9i thin JDBC driver.
- The Oracle 9i thin JDBC driver has been qualified for WebObjects 5.2 only.

Where to Install the Oracle JDBC drivers

This section contains the proper location for the Oracle JDBC drivers. The applicable platform is listed in bold.

1. The JDBC driver (classes 12.zip) must be installed where the Java VM can find it. The simplest procedure is to add the JDBC driver (zip file) to the Java VM's "extensions".

   (All Platforms)

   Examples

   Windows 2000
   The Java VM "extension" directory is generally C:\\jdk1.3.x\\jre\\lib\\ext\\ . However, the exact directory depends on where JDK 1.3.x is installed on your computer.

   Mac OS X - WebObjects 5.1 to 5.3
   Place the JDBC file in **`/Library/Java/Extensions`**

   Mac OS X - WebObjects 5.0 only
   Place the JDBC file in **`/Library/Java/Home/lib/ext/`**

   Solaris
   Place the JDBC file in **`/usr/java/jre/lib/ext`**

2. Install the JDK 1.1 driver in **`$NEXT_ROOT/Library/Java`** and modify the JavaConfig.plist file accordingly.

   Windows 2000 only

   When doing development on Windows 2000, the situation is somewhat more complicated. The WebObjects 5 runtime uses a Java 2 VM and requires a JDK 1.3.x compatible JDBC driver just like Mac OS X and other platforms. However, EOModeler uses the Java Bridge, which only supports JDK 1.1 on Windows and therefore requires a JDK 1.1 compatible driver. Consequently, in order to do development and testing on Windows 2000, two versions of a particular JDBC driver are needed. One that is JDK 1.3 compatible for the WebObjects 5 runtime, and another that is JDK 1.1 compatible for use by EOModeler and the Java Bridge.

   To use a JDBC 1.1 driver with EOModeler on Windows 2000, you should add it to the JavaConfig.plist. This is the Oracle driver **classes111.zip** in this case. If your WebObjects installation is not in **C:/Apple**, substitute the appropriate path below. The Unix notation of "/" for the directory separator is used in the samples

   a. Log in with an administrator account.
   b. Copy classes111.zip to `C:/Apple/Library/Java/`
   c. Edit the file `C:/Apple/Library/Java/JavaConfig.plist`
   d. Add `$NEXT_ROOT/Library/Java/classes111.zip` to the entry for the "DefaultClasspath". Items in the list should be separated by a semicolon ";". Use the term "$NEXT_ROOT" literally, following the pattern of the other entries.

   Note: If Windows is used only as a deployment platform, then the JDK 1.1 compatible driver is not needed.

Setting up the proper connection dictionary for EOModeler and Oracle JDBC drivers

The EOModeler login panel shows three textfields:

Username: Enter the username such as `scott`

Password: Enter the password such as `tiger`

URL: By definition, the JDBC URL has the following format:

`jdbc:oracle:drivertype:user/password@database`

drivertype - Is thin for the Oracle thin driver, or oci8 if you have downloaded the OCI driver that includes the jdbcoci8.dll file. The oci8 driver can access either an Oracle7 or an Oracle8 server.

user/password - Is not needed in the EOModeler URL textfield, since it is already specified in the two other textfields.

@database - For JDBC OCI drivers: An entry in the tnsnames.ora file.

For JDBC Thin: A string of the form **host:port:sid**

Example 1: Oracle JDBC Thin driver

Username: scott

Password: tiger

URL: jdbc:oracle:thin:@myServer:1521:myServerID

`myServer` is the hostname

`myServerID` is an Oracle sid defined in your **`tnsnames.ora`** file.

Note: If you installed the OCI client libraries on Windows, the tnsnames.ora file resides in: $ORACLE_HOME/network/admin

Troubleshooting connection errors

- If your connection dictionary is incorrect, you may see the following error:

  SQLException raised when connecting : java.sql.SQLException: ORA-06401: NETCMN: invalid driver designator

  Check if you have the proper drivertype in your URL, or if the @database entry matches an alias in your tnsnames.ora file, and so forth.

- **Windows 2000** - If you did not update your Default Classpath in the file JavaConfig.plist to include the classes111.zip (JDBC driver), you may see the following error:<

  JDBC connection failed for driver :'oracle.jdbc.driver.OracleDriver'. Driver not found in Java Runtime! Please verify your CLASSPATH environment variable. The current CLASSPATH for your application is :C:\\Apple\\Library\\Frameworks\\JDBCEOAdaptor.framework\\Resources\\Java\\.;/Library/Java; C:/Apple/Local/Library/Java;C:/Apple/Library/Java;C:/Apple/Library/JDK/lib/classes.zip; C:/Apple/Library/Frameworks/JavaVM.framework/Classes/awt.jar;C:/Apple/Library/JDK/lib/swingall.jar

- WebObjects 5.2 - If you use an old Oracle 8i JDBC driver to access an Oracle 9i database server, you may see the following error:

  ORA-00600: internal error code, arguments: [19944], [], [], [], [], [], [], []

  Make sure that you are using an Oracle 9i JDBC driver to access the Oracle 9i database server.

Published Date: Feb 20, 2012

WebObjects 5: How to Convert WebObjects 4.5 EOModel Files to WebObjects 5

This document describes how to convert WebObjects 4.5 EOModel files into a compatible format for WebObjects 5.
This article has been archived and is no longer updated by Apple.

Overview

WebObjects 4.5/4.5.1 provides a choice of adaptors depending on your development platform, such as Sybase, Infomix, Oracle, or FlatFile adaptor. In WebObjects 5, these model files need to be converted to a compatible format depending on the type of adaptor you have selected (JDBC or JNDI).

This document provides the steps needed to convert WebObjects 4.5 EOModel files into WebObjects 5 EOModel files for the JDBC adaptor and supported databases. See technical document 72598 "**WebObjects Compatibility Guide**" for additional information on the list of supported databases for each WebObjects version.

Setting up the New Connection Dictionary

The EOModeler should always start from a known good state before converting EOModels. The best way to do this is to quit the WebObjects 5 EOModeler, if open, before proceeding with the conversion steps listed below.

1. Open a 4.5 EOModel file with WebObjects 5 EOModeler.

   Important: Do not click on any item in the model file since the adaptor used in WebObjects 4.5 is not available in WebObjects 5. Otherwise, an alert will appear when you click on an item in the model. After closing the error panel, you can proceed with viewing other entities. Below is a typical error message:

   "Unable to load the OpenBaseLite adaptor: classForAdaptorNamed:: Unable to get the name of the class to instantiate an adaptor with the name OpenBaseLite. The possible causes for this error are: you don't have the adaptor installed on your system, you are on PDO and have not linked the adaptor into your application, or the info dictionary for this adaptor is corrupted."

2. Choose Model > Switch Adaptor.

3. Select JDBC from the list of adaptors.

4. Enter the JDBC connection dictionary information. For help setting the Oracle JDBC connection dictionary, see technical document 75145, "**WebObjects 5: How to use Oracle JDBC Drivers**". For other databases, consult your JDBC driver documentation.

5. Save the new model file.

6. Close the model file.

7. Verify the connection dictionary is set correctly.

Re-open the model file and choose Model > Set Adaptor Info.

WebObjects 5.0 Only

Do not use the inspector to see the connection dictionary on the root item in the entity list. If you do, you must quit EOModeler and re-open the model file before you can switch to a new adaptor, or set a new connection dictionary (Apple Reference 2700580). This issue only occurs in WebObjects 5.0, and has been corrected in WebObjects 5.0 Update 1 as well as WebObjects 5.1 and WebObjects 5.2.

Setting the Correct Attributes

After completing Step 1 in Setting up the New Connection Dictionary for each entity in the model file, use the Add Column pop-up menu in the Attributes window, and add the column "Value Class (Java)" and "Value Type" to make the Value Type and Value Class visible. The Value Type needs to be set for any object whose superclass is Number. For example, if the Java Class for the attribute is BigDecimal, then the JDBC Value Type should be set manually to B.

Additional reference:

For a complete discussion of value types, see (http://developer.apple.com/techpubs/webobjects/UsingEOModeler/4WorkingWithAttributes/chapter_4_section_11.html).

Known Issues With Attribute Settings

Converting Oracle CHAR types to JDBC

Check that EOModeler does not convert string attributes of CHAR types into VARCHAR2 or VARCHAR. In addition to the CHAR external type, you also need to manually set the JDBC value type to 'c'.

Converting Oracle9i TIMESTAMP type to JDBC (WebObjects 5.2 only)

Apple Reference 3157719

Using the Oracle 9.2.01 JDBC Driver, EOModeler incorrectly reverse engineers the TIMESTAMP external data type to an internal type `NSData`.

Manually fix this issue by using the following settings:

External type: TIMESTAMP

Internal type: NSTimestamp

Value type: T

Important: Installing WebObjects 5.2.1 resolves this issue. Using WebObjects 5.2.1, EOModeler can now correctly handle the Oracle 9i external time TIMESTAMP

Converting DATE's from OpenBase (in WebObjects 4.5/4.5.1) to JDBC

Apple Reference 2712976

WebObjects 5.0

When switching your adaptor from OpenBase to JDBC, make sure the external type for the date attributes are defined as "datetime". If they are not, make the appropriate change in the model and in the database. Otherwise, an INSERT operation will fail.

WebObjects 5.1 or WebObjects 5.2

This issue has been corrected in WebObjects 5.1 and 5.2. To convert DATES from OpenBase to JDBC, use the following settings:

External type: datetime

Internal type: NSTimestamp

Value type: T

External type: date

Internal type: NSTimestamp

Value type: D

Troubleshooting

If a WebObjects 4.5 model file fails to open with the WebObjects 5 EOModeler Tool

If WebObjects 4.5 or 4.5.1 Development Environment is available:

1. Open the model file using the EOModeler from WebObjects 4.5.
2. Switch the Adaptor type to "none"
3. Save the model file.
4. Open the modified model file using the EOModeler from WebObjects 5
5. Complete the conversion process described in sections Setting the Connection Dictionary and Setting the Correct Attributes.

Steps if only WebObjects 5 Development Environment is available:

Mac OS X

1. Locate the Model file in the Finder.
2. Choose Show Package Contents from shortcut menu. (Control-click the file's icon). A new Finder window appears with an index.eomodeld file.
3. Open the index.eomodeld file using TextEdit.
4. Locate the line that contains "adaptorName = your_old_adaptor".
5. Change your_old_adaptor to JDBC.
6. Save the file, then restart EOModeler. EOModeler can now open the modified model file.
7. Complete the conversion process described in sections Setting the Connection Dictionary and Setting the Correct Attributes.

Microsoft Windows 2000

1. Open the index.eomodeld file for your model using TextEdit.
2. Find the line that contains "adaptorName = your_old_adaptor".
3. Change your_old_adaptor to JDBC.
4. Save the file, then restart EOModeler. EOModeler can now open the modified model file.
5. Complete the conversion process described in sections Setting the Connection Dictionary and Setting the Correct Attributes.

WebObjects 5: Technical Specifications

This document provides the technical specifications for WebObjects 5.

Additional information on the WebObjects is available at: http://www.info.apple.com/usen/webobjects/

This article has been archived and is no longer updated by Apple.

System Requirements

Development platforms

- Mac OS X 10.0
- Windows 2000 Pro

Deployment platforms

WebObjects applications are designed to work with any Java 2 Platform, Standard Edition 1.3 runtime environment, using JDBC 2.0 for universal database connectivity. The following platforms are fully qualified and supported:

- Mac OS X Server 10.0
- Windows 2000 Pro
- Solaris 8

Supported data sources

- Oracle 8i

Automated data access

Object-relational mapping

- Eliminates the need to write JDBC or SQL code

- Manages one-to-one, one-to-many, many-to-many, and inter-database relationships

- Automatically handles object fetching, caching, and committing

- Provides automatic transaction management, including support for undo, redo, commit, and rollback

- Allows you to embed referential integrity constraints directly into the model rather than depending on programmer conformance

Database independence

- Enables developers to replace the underlying database by simply updating the model, without changing any code

- Lets you customize the object model for a particular application without having to modify the database

- Supports the seamless incorporation of multiple databases into a single object model

XML interchange

- Allows your applications to easily consume and generate XML data streams

- Interoperates with other XML-based applications

- Lets you manage XML just like any other data source

- Generates dynamic SMIL for use in multimedia applications

Streamlined web-page generation

WebObjects template engine

- Allows the creation of virtually any form of markup: HTML, XML, SMIL, and others

- Hides the actual object model from the web designer, preventing scripting errors from corrupting the database

- Works with the bundled WebObjects Builder (which understands the object model), or with standard HTML authoring tools

Reusable components

- Integrates templates, mappings, and related code into a single reusable package
- Supports the updating of mappings independently of the web-page design
- Includes dozens of ready-to-use system components
- Allows you to easily create and reuse your own components

Built-in session management

- Eliminates the need to write your own session management code
- Does not require cookies on the user's system
- Allows developers to manage sessions at the object level rather than the HTTP level

Integrated tool support

Project Builder

- Provides a broad array of prebuilt application templates for rapid startup
- Includes powerful assistants for creating Direct to Web and Direct to Java Client applications
- When run on Mac OS X, supports CVS and graphical debugging

Direct to Web/Direct to Java Client

- Enables quick creation of front ends for browsing, searching, and editing any database
- Derives relevant entities and fields heuristically, directly from the object model
- Scalable user interface dynamically adjusts to any number of entries
- Lets you use a Java applet to easily customize the layout and appearance
- Simplifies maintenance by making it possible to reuse framework code rather than generating application-specific code

Enterprise Object Modeler

- Allows you to extract and view a schema from any JDBC database, and to write new schemas
- Lets you graphically view and edit entity-relationship diagrams
- Cleanly integrates business logic with fine-grained data objects

WebObjects Builder

- Lets you freely view and edit HTML in either markup or preview mode
- Makes it easy to quickly assemble prebuilt or custom WebObjects components into a single dynamic page
- Enables you to graphically map components onto the underlying object model

Interface Builder

- Helps you rapidly generate and test user interfaces in Swing (Java, cross-platform) and Cocoa (Objective-C or Java, MacOS X
- Allows you to graphically create and edit connections between user interface widgets and the underlying database objects
- Ensures an Aqua-compliant look and feel on Mac OS X

WebObjects Monitor

- Makes it possible to remotely view and manage application server instances
- Generates statistics of server usage patterns

Record and Playback Manager

- Lets you record web sessions and store them for testing purposes

- Permits the scheduling of a single playback or groups of playbacks for testing across multiple clients

- Allows you to view graphical displays of results

- Supports access from any web browser

Comprehensive desktop application support

Abstract interface management layer

- Automatically handles caching and synchronization of the user interface with the underlying frameworks

- Avoids database roundtrips for many operations by providing a local object store

- Supports both Swing (for Java 2) and Cocoa (for Mac OS X)

- Supports rich media types, including QuickTime movies and RTSP streams

Three-tier Java client support

- Delivers all data over the HTTP server for maximum reach and scalability

- Handles all session management, transport, and data access transparently with the underlying frameworks

- Gives you the optimal tradeoff between performance and security by letting you freely move business logic between a client and the application server

- Works with either browser-based applets or stand-alone Java applications

Two-tier Cocoa clients on Mac OS X

- Provides a fully native UI that's tightly integrated with Mac OS X technologies

- Includes sophisticated multilingual string manipulation using the Cocoa text engine

- Ensures that stand-alone applications access the database directly, without requiring a web server

Straightforward pure-Java deployment

Java 2 compatibility

- Runs on any Java 2, Standard Edition v1.3 virtual machine*

- Supports full access to all Java 2 APIs, including RMI/IIOP and JNDI

- Provides easy interoperability with other Java applications

*** Note:** WebObjects 5 is officially qualified for use only on Mac OS X, Windows 2000 Pro, and Solaris 8 using Oracle 8i with JDBC 2 and the Java 2 Platform, Standard Edition 1.3.

Flexible, low-cost licensing

- Requires only one license per machine, regardless of platform, speed, or number of processors

- Includes no restrictions on the number of transactions, application instances, or threads

- Each license includes full database connectivity and integration support

Reliable, scalable deployment services

- Lets you easily add servers using a variety of prebuilt scheduling mechanisms

- Includes no restrictions on the number of transactions, application instances, or threads

- Allows you to run both WebObjects 4.5.1 and WebObjects 5 applications on the same system

Published Date: Feb 19, 2012

WebObjects: Using WebObjects Log Files

This document explains how to read and use WebObjects 4.5.1 and WebObjects 5.0 log files using Solaris, Microsoft Windows NT or Windows 2000, and Mac OS X.
This article has been archived and is no longer updated by Apple.
Before you start: In order to access WebObject log files you need to have root or administrator access to the WebObjects application server.

The location of the wotaskd log file varies depending on the computer operating system and version of WebObjects used. The table below lists the location of the wotaskd log file.

	Windows 2000	Solaris	Mac OS X
WebObjects 4.5.1	Event Viewer	/tmp/wotaskd.log	/var/log/webobjects.log
WebObjects 5.0	Event Viewer	none by default. See "Creating a wotaskd log file on Solaris running WebObjects 5.0", below for how to specify.	/var/log/webobjects.log

Using tail (Solaris and Mac OS X)

The tail command is used to view the last lines of a file from a terminal window. This is helpful since WebObjects processes add the most recent information into the last lines of the log file. Three options are described in this section, tail, tail -f, and tail -N.

`tail`

Example: `tail webobjects.log`

If the tail command is used without any options, it displays the last ten lines of a text file on the computer monitor.

`tail -f`

Examples: `tail -f webobjects.log`

Solaris: `tail -f /tmp/wotaskd.log`
Mac OS X: `tail -f /var/log/webobjects.log`

When used with the -f option, tail continues to run and displays all output on the screen. The -f option is very useful when trying to determine when something is happening.

`tail -N`

Where `N` is a number of lines.

Examples: `tail -50 webobjects.log`

Solaris: `tail -50 /tmp/wotaskd.log`
Mac OS X: `tail -50 /var/log/webobjects.log`

The example above displays the last 50 lines of the log file on the computer monitor. It might be necessary to use the more command in conjunction with the line number option to ensure all the output is visible on the computer display. The space bar is used to display the next screen of output.

Example of using `tail` **with** `more`**:** `tail -50 webobjects.log | more`

Additional information on using the tail command is available in the tail manpage.

Example: `man tail`

Using the Event Viewer (Microsoft Windows NT and Windows 2000)

The Event Viewer is used on Microsoft Windows NT and Windows 2000 to view log files for running processes. However, the Event Viewer is accessed differently on Windows NT than on Windows 2000.

Microsoft Windows NT

1. Choose Programs -> Administrative Tools (Common) -> "Event Viewer" from the Start Menu.
2. Choose System from the Log Menu.
3. Double-click machd, nmserver, or pbs to view their contents

Microsoft Windows 2000

1. Choose Settings -> Control Panels
2. Open Event Viewer
3. Click the Tree tab
4. Select System Log
Several columns appear in the window.
5. Click Source to sort the Source column.
The source column contains the process that made the log entry.
6. Double-click machd, nmserver, or pbs to view their contents.

Creating a wotaskd log file on Solaris running WebObjects 5.0

By default, the output of `wotaskd` is redirected to `/dev/null` which means the output is not stored. In order to store the output of wotaskd, the output needs to be redirected to a file.

1. Edit /etc/rc2.d/S79WOServices
2. Locate the line of the file that starts `wotaskd`
3. Change the line from /dev/null to `/tmp/wotaskd.log`
This redirects the output of `wotaskd` to the `/tmp/wotaskd.log` file.

Example:

Before:

```
 "$WOSERVICE" -appPath "$WOTASKD" -WOPort "$PORT" >/dev/null 2>&1 &
```

After:

```
 "$WOSERVICE" -appPath "$WOTASKD" -WOPort "$PORT" >/tmp/wotaskd.log 2>&1 &
```

Important: You must restart wotaskd in order for this change to take effect.

The commands for stopping and restarting wotaskd on Solaris are:

```
/etc/rc2.d/S79WOServices stop
```

```
/etc/rc2.d/S79WOServices start
```

LaserWriter Pro 810, 600, 630: Generating a Startup Page

This document explains how to generate a LaserWriter Pro 600, LaserWriter Pro 630, and LaserWriter 810 startup page. It also provides a sample startup page for the printers.

This article has been archived and is no longer updated by Apple.

Generating the Startup Page

- The startup page for the LaserWriter Pro series is automatic.
- Turning the printer off and then back on generates the startup page.
- The startup page can be disabled or enabled by using the Apple Printer Utility.

Figure 1 Startup page for the LaserWriter Pro 600 and 630.

Note: The model information and types of connections are different on the LaserWriter Pro 600 and 630 startup page.

Figure 2 Startup page of the LaserWriter Pro 810.

Published Date: Feb 20, 2012

LaserWriter 12/640, 12/600, 12/660, 16/600, 4/600 PS: Generating a Startup Page

This document explains how to generate a startup page for the LaserWriter 12/640 PS, Color LaserWriter 12/600 PS, Color LaserWriter 12/660 PS, and LaserWriter 4/600 PS printer. It also provides a sample startup page for the printers.

This article has been archived and is no longer updated by Apple.

Generating the Startup Page

- The startup page for the LaserWriter Pro series is automatic.
- Turning the printer off and then back on generates the startup page.
- The startup page can be disabled or enabled by using the Apple Printer Utility.

Figure 1 Startup page for the LaserWriter 12/640 PS

Note: The startup page is automatically generated, by default, on startup. See Related Documents for information on turning off the startup page.

Figure 2 Startup page of the Color LaserWriter 12/600 and 12/660 PS

Figure 3 Alternate startup page for the Color LaserWriter 12/600 PS and 12/660 PS

Notes:

1. The Color LaserWriter 12/600 PS and Color LaserWriter 12/660 PS startup pages are identical except for the model information and amount of RAM.

2. The Color LaserWriter 12/600 PS and Color LaserWriter 12/660 PS have more than one test page. You can select which page, if any, you want to print at startup using the Apple Printer Utility.

Figure 4 Startup page for the LaserWriter 16/600 PS.

Figure 5 Startup page for the LaserWriter 4/600 PS

Note: The LaserWriter 4/600 PS has no power switch, you must unplug the printer to generate a startup page.

WebObjects: Mac OS X 10.1 Compatibility Statement

This document contains the WebObjects and Mac OS X 10.1 compatibility statement.
This article has been archived and is no longer updated by Apple.

WebObjects and Mac OS X 10.1

Apple has released **WebObjects 5 Update 3** to enable users to upgrade their Mac OS X systems to Mac OS X 10.1 and continue using WebObjects 5. After upgrading the operating system to 10.1, you must also download and install the Mac OS X 10.1 Development Tools, which are available from **Apple Developer Connection**, before installing WebObjects 5 Update 3.

Due to several incompatibilities between Mac OS X 10.1 and WebObjects 4.5.1, you should not upgrade your WebObjects 4.5.1 systems from Mac OS X 10.0.4 at this time. Apple is hard at work on an update to WebObjects 4.5.1 that will resolve the known incompatibilities and allow developers to upgrade their WebObjects 4.5.1 systems to Mac OS X 10.1. This update is expected to be available soon.

Published Date: Oct 10, 2016

Macintosh Diagnostic Starter Kit: Test Disc 2 CD Not a Startup Disc

This document explains why Test Disc 2 of the Macintosh Diagnostic Starter Kit cannot be used as a startup disc.

This article has been archived and is no longer updated by Apple.

Symptom

Test Disc 2 of the Macintosh Diagnostic Starter Kit cannot be used as a startup disc.

Product affected

- Macintosh Diagnostic Starter Kit

Solution

Test Disc 2 is not designed to be used as a startup disc. It is designed to be used in conjunction with the MacTest Pro CD when testing a CD-ROM disc drive. Test Disc 2 cannot be used on itself or used as a startup disc. When running the CD-ROM test with MacTest Pro, you will be prompted for the Test Disk 2 CD to do further testing.

Published Date: Feb 20, 2012

WebObjects 5: WebObjects 5 Update 3 Overview

This document contains an overview and download information for Apple's Update 3 for WebObjects Release 5. This update corrects the known incompatibilities between WebObjects 5 and Mac OS X 10.1 and is required on that platform. This update should not be installed on Mac OS X versions earlier than 10.1.

The WebObjects Current Patch List, document 70037, contains information on all available patches and updates for all versions of WebObjects. Read this document if you're not sure which patches you need on your system.

Related Documents

70037 WebObjects Current Patch List

This article has been archived and is no longer updated by Apple.

IMPORTANT

WebObjects 5 Update 3 includes an API change which corrects an incompatibility between WebObjects 4.5(.1) and WebObjects 5. This change will also be made in future versions of WebObjects. Specifically, the return type of WORequest.formValueForKey() has been changed to Object. Due to the nature of Java, an application that uses this method which was built using a version of WebObjects 5 prior to Update 2 will generate exceptions if it is run on a system with WebObjects 5 Update 2 or later installed. These applications will need to be rebuilt with minor source code changes to run on systems with WebObjects 5 Update 2 or later installed. This change is further documented below as Apple Reference #2736189.

Language/OS Required	Release Date	Version	Read Me	Software
Any language (multicountry) Mac OS X 10.1 **Developer Update**	2001-10-22	1.0	English	Developer Update 14.6 MB
Any language (multicountry) Mac OS X 10.1 **Deployment Update**	2001-10-22	1.0	English	Deployment Update 10.6 MB

WebObjects 5 Update 3 for Mac OS X (Server) 10.1

Important: There are two mutually exclusive updates for this platform. If you have WebObjects 5 Developer installed on Mac OS X 10.1, you need WebObjects 5 Developer Update 3. If you have WebObjects 5 Deployment installed on Mac OS X Server 10.1, you need WebObjects 5 Deployment Update 3. You do not need both on any system.

This update includes all changes made in WebObjects 5 Updates 1 and 2. Therefore, you do not need to install either of the earlier WebObjects 5 updates before installing this one. If you already have one or both of the earlier updates installed on your system, you can install WebObjects 5 Update 3 on top of them.

This update is available through the Software Update feature of Mac OS X. If you use this method, only the proper update for the software which you have installed on your system will be visible and available for download. If you prefer to download and install the package manually, follow the instructions below.

Note: WebObjects 5 Deployment Update 3 requires Mac OS X Server 10.1 or later. WebObjects 5 Developer Update 3 requires Mac OS X 10.1 or later as well as the Mac OS X 10.1 Development Tools (Not the December 2001 Mac OS X 10.1 Developer Tools). If you have not yet updated to the correct version of Mac OS X (Server) and Tools, you must do so before installing WebObjects 5 Update 3. The Mac OS X 10.0.1 and Mac OS X 10.1 Development Tools images are still available on the Apple Developer web site.

Note: If you are creating a new Mac OS X WebObjects 5 development system, you should install the software in the following order:

1. Mac OS X 10.1
2. Mac OS X 10.1 Development Tools
3. WebObjects 5 Developer
4. WebObjects 5 Developer Update 3

If you are upgrading an existing Mac OS X 10.0.x WebObjects 5 development system, you should install the software in the following order:

1. Mac OS X 10.1 upgrade
2. Mac OS X 10.1 Development Tools
3. WebObjects 5 Developer Update 3

Important: Whether you are using Software Update or installing the update manually, you must be logged in as "root" user in order to perform the installation. Logging in as "Administrator", or authenticating as "root" is insufficient. Failure to follow this requirement will result in an installation failure. You must also ensure that no WebObjects or EOF applications are running during the installation of the update.

Manually Installing WebObjects 5 Developer Update 3 on Mac OS X 10.1

These instructions are for manually downloading and installing WebObjects 5 Developer Update 3. If you are installing using Software Update, see the section titled "WebObjects 5 Update 3 for Mac OS X 10.1", above.

Note: This update requires Mac OS X 10.1 or later. If you have not updated to this version of Mac OS X, you must do so before installing WebObjects 5 Update 3.

1. Download WO5MacOSXDevUpdate3.dmg.bin, the disk image containing the update installer for Mac OS X 10.1.

The update is available from:

FTP: ftp://ftp.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/5.0/WO5MacOSXDevUpdate3.dmg.bin

HTTP:
http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/5.0/WO5MacOSXDevUpdate3.dmg.bin

Stuffit Expander should automatically expand the .bin, leaving WO5MacOSXDevUpdate3.dmg.

2. Double-click WO5MacOSXDevUpdate3.dmg.
Disk Copy will mount the update disk image as "WebObjects 5 Developer Update 3 for Mac OS X" on your Desktop.

3. Double-click the "WebObjects 5 Developer Update 3 for Mac OS X" icon to view the disk image in Finder.

4. Double-click on WO5MacOSXDevUpdate3.pkg.
The Authorization panel opens.

5. You need to install the update as root. If you do not have the Administrator password, see your system administrator. Click the lock icon at the bottom left of the panel to authenticate as the root user. Enter Name: "root" and Password: "<root password>", then click OK.

Important: You have to be logged in as "root" user in order to perform the installation. Logging in as "Administrator", or authenticating as "root" is insufficient. Failure to follow this requirement results in an installation failure.

6. Click Continue in the Introduction panel.

7. Read the software license agreement then click Continue.
To agree to the license and continue the installation, click Agree.

8. Select the volume containing Mac OS X and WebObjects 5 Developer, then click Continue.

9. Make sure that there are no WebObjects or EOF applications running.

10. Click Install to proceed with installation. The Installer window displays information about the progress of the installation, which may take several minutes.

11. Restart your computer.

Manually Installing WebObjects 5 Deployment Update 3 on Mac OS X Server 10.1

These instructions are for manually downloading and installing WebObjects 5 Deployment Update 3. If you are installing using Software Update, see the section titled "WebObjects 5 Update 3 for Mac OS X 10.1", above.

Note: This update requires Mac OS X Server 10.1 or later. If you have not updated to this version of Mac OS X Server, you must do so before installing WebObjects 5 Update 3.

1. Download WO5MacOSXDepUpdate3.dmg.bin, the disk image containing the update installer for Mac OS X Server 10.1.

The update is available from:

FTP: ftp://ftp.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/5.0/WO5MacOSXDepUpdate3.dmg.bin

HTTP:
http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/5.0/WO5MacOSXDepUpdate3.dmg.bin

Stuffit Expander should automatically expand the .bin, leaving WO5MacOSXDepUpdate3.dmg.

2. Double-click WO5MacOSXDepUpdate3.dmg.
Disk Copy will mount the update disk image as "WebObjects 5 Deployment Update 3 for Mac OS X" on your Desktop.

3. Double-click the "WebObjects 5 Deployment Update 3 for Mac OS X" icon to view the disk image in Finder.

4. Double-click on WO5MacOSXDepUpdate3.pkg.
The Authorization panel will open.

5. You need to install the update as root. If you do not have the Administrator password, see your system administrator. Click the lock icon at the bottom left of the panel to authenticate as the root user. Enter Name: "root" and Password: "<root password>" and click the OK button.

Important: You have to be logged in as "root" user in order to perform the installation. Logging in as "Administrator", or authenticating as "root" is insufficient. Failure to follow this requirement will result in an installation failure.

6. Click the Continue button in the Introduction panel.

7. Read the software license agreement and then click the Continue button. To agree to the license and continue the installation, click the Agree button.

8. Select the volume that contains Mac OS X Server and WebObjects 5 Deployment and then click the Continue button.

9. Make sure that there are no WebObjects or EOF applications running.

10. Click the Install button to proceed with installation. The Installer window displays information about the progress of the installation, which may take several minutes.

11. Restart your computer.

Corrected in WebObjects 5 Update 3

OpenBase JDBC drivers installed in the wrong java home dir for Mac OS X 10.1

Apple Reference # 2737345

ISSUE:

Mac OS X 10.1 includes an updated Java 1.3.1 VM, which has its Java home extensions directory in a different location than the 1.3 VM included with Mac OS X 10.0.x. WebObjects applications can therefore not find the OpenBase JDBC drivers after installing WebObjects 5 on Mac OS X 10.1.

RESOLUTION:

During installation of this update, a post-install script copies the OpenBase JDBC drivers to the new 1.3.1 JVM extensions directory (/Library/Java/Extensions).

WOAssistant doesn't work on 10.1

Apple Reference # 2767516

ISSUE:

When creating a new project, the dialogs to add frameworks and models to the project did not function properly. The predefined lists could not be modified.

RESOLUTION:

The framework and model lists can now be modified as expected.

Creating Java Client application fails on 10.1

Apple Reference # 2768399

ISSUE:

Java Client projects cannot be created. The project setup fails, which appears in the GUI as though it never completes. (Project Builder does not hang.)

RESOLUTION:

This problem has been corrected.

Need updated java eopalette to work with 10.1

Apple Reference # 2779596

ISSUE:

There are incompatibilities in Interface Builder between Mac OS X 10.0.x and Mac OS X 10.1.

RESOLUTION:

The java eopalette has been upgraded to work with Interface Builder on Mac OS X 10.1.

WebObjects Builder broken after upgrading to 10.1

Apple Reference # 2780028

ISSUE:

The upgrade installer for Mac OS X 10.1 removes HTMLEditing.framework from the system. Since WebObjects Builder depends on this framework, it no longer runs. Upon launching WebObjects
Builder, you see the following error message:

```
dyld: /Developer/Applications/WebObjectsBuilder.app/Contents/MacOS/WebObjects Builder can't open library:

/System/Library/PrivateFrameworks/HTMLEditing.framework/Versions/A/HTMLEditing

(No such file or directory, errno = 2)
```

RESOLUTION:

The update installs the version of HTMLEditing.framework shipped with WebObjects 5.

Need correct version of genclasspath

Apple Reference # 2780497

ISSUE:

The version of /usr/lib/genclasspath included with the Mac OS X 10.1 Developer Tools does not work properly with WebObjects.

RESOLUTION:

The update installs the version of /usr/lib/genclasspath shipped with WebObjects 5.

Apache adaptor doesn't build on Mac OS X 10.1

Apple Reference # 2795562

ISSUE:

The Apache adaptor fails to build on Mac OS X 10.1 with an "Undefined symbols" link error. The error is related to the two level namespace changes in Mac OS X 10.1.

RESOLUTION:

Customers who need to rebuild the Apache adaptor can add the linker flag "-flat_namespace". This can be added in ProjectBuilderWO using the Build Attributes panel in the Project Inspector.

Corrected in WebObjects 5 Update 2

to-one and to-many browser icons look the same on Mac OS X

Apple Reference # 2704283

ISSUE:

It was difficult to distinguish to-one and to-many relationships in the variables browser of WebObjects Builder.

RESOLUTION:

The icons are now drawn with a more distinct appearance.

Truncated binding character does not display properly in Japanese environment

Apple Reference # 2704286

ISSUE:

Due to an incorrect setting of the system encoding, the character displayed in WebObjects Builder when a binding was too long was not the intended ellipsis, but a kanji character.

RESOLUTION:

The truncated binding character is now displayed as an ellipsis in a Japanese environment.

Adaptor XML parser can crash with bad syntax

Apple Reference # 2706425

ISSUE:

Certain textual formatting errors in the XML configuration file for the WebObjects adaptor can cause the adaptor to crash. (Note that wotaskd produces correct XML, so this only applies if a file is being used to configure the adaptor.)

RESOLUTION:

The XML parser has been modified to correctly handle the case that was causing the crash.

Error when adding a JavaClient palette element to a component

Apple Reference # 2709167

ISSUE:

Dragging a JavaClient palette element into a component results in an alert panel containing the message "This palette resource requires 'nil' which is not part of this project." The palette item does not get added to the component even after the 'Add framework' button is clicked in the alert panel.

RESOLUTION:

This problem has been corrected.

WebObjects Builder does not properly display Display Group array attributes

Apple Reference # 2717487

ISSUE:

Arrays of objects with attributes were sometimes displayed as a single object in Display Groups.

RESOLUTION:

Arrays are now handled properly in Display Groups.

WOActiveImage height and width attributes in wrong place

Apple Reference # 2718064

ISSUE:

For a WOActiveImage located outside of a form WebObjects uses the combination of an image and a hyperlink to provide the WOActiveImage functionality. Attributes of the WOActiveImage have to be set on either the image or the hyperlink. In the case of the height and width these attributes were set on the hyperlink component instead of the image, which caused sizing issues.

RESOLUTION:

Height and width are now set as image attributes.

NSArray's key value coding operators (@min, @max, etc.) don't work

Apple Reference # 2718082

ISSUE:

Using valueForKey()/valueForKeyPath() with @min or @max operators on NSArrays only worked with numbers.

RESOLUTION:

The operators were rewritten to work with more data types (numbers, timestamps, strings, and comparables where possible).

International characters are not passed correctly using WOFileUpload

Apple Reference # 2721949

ISSUE:

The form values passed as part of a mutipart/form-data form (FileUpload functionality) were not encoded properly.

RESOLUTION:

The form values passed as part of mutipart/form-data form are now encoded properly.

WOHTTPConnection returns a WOResponse with no associated real content when content-length=0

Apple Reference # 2722156

ISSUE:

WOHTTPConnection was HTTP/1.0 compliant. In HTTP/1.1, servers are allowed to skip the the content-length entry in the returned headers or even return content-length=0. These servers employ several different ways to allow the client to deduce the actual length, including chunking (Transfer-Encoding="chunked") and using the "multipart/byteranges" media type. Since WOHTTPConnection was HTTP/1.0 compliant, it couldn't figure out the actual content length and data.

RESOLUTION:

WOHTTPConnection is now HTTP/1.1 compliant. When you create a WORequest you should set the version to "HTTP/1.1".

Building frameworks for Deployment doesn't install Info.plist

Apple Reference # 2722167

ISSUE:

Building a WebObjects framework project with the Deployment build style results in a framework without a Resources/Info.plist file. This causes a null pointer exception in the app when trying to access the component in the framework.

RESOLUTION:

The Info.plist file is now correctly generated for framework projects.

Key value coding issues with booleans

Apple Reference # 2725731

ISSUE:

Some key value coding operations with boolean/Boolean methods/variables were not executed correctly and raised exceptions.

RESOLUTION:

Key value coding now properly handles boolean variables and methods..

EOModel objects not sorted correctly

Apple Reference # 2725732

ISSUE:

Most arrays of model objects (like entities, attributes, and relationships) were not sorted by name.

RESOLUTION:

Sorting has been fixed for model objects.

WODisplayGroup does not reset batch index count after fetch

Apple Reference # 2727686

ISSUE:

WODisplayGroup did not reset the batch index count after qualifying its datasource. This sometimes caused the display group to not show the fetched objects.

RESOLUTION:

The display group batch index count is now reset when the datasource is requalified.

Compiling does not re-compile changed source files

Apple Reference # 2730063

ISSUE:

Rebuilding a running application would fail to update the jar file on Mac OS X.

RESOLUTION:

Build scripts were using 'CpMac' instead of cp for certain file copies. 'CpMac' will not copy over files which are in use. The build scripts now use 'cp' instead, which does copy over files which are in use.

D2WQueryBoolean throws IllegalStateException

Apple Reference # 2730164

ISSUE:

D2WQueryBoolean is represented as a WOCheckBoxList, which was calling a deprecated API at creation time. The deprecated API then threw an exception.

RESOLUTION:

WOCheckBoxList no longer uses the deprecated API and therefore D2WQueryBoolean does not throw the IllegalStateException.

JSImageFlyover throws exception

Apple Reference # 2731214

ISSUE:

JSImageFlyover throws an exception "lookup of unknown key: 'uniqueID'" in the appendToRespose cycle.

RESOLUTION:

JSImageFlyover now works correctly.

NullPointerException in EODistributionContext

Apple Reference # 2732498

ISSUE:

EODistributionContext did not handle some notifications from other object stores well and raised NullPointerExceptions.

RESOLUTION:

The handling of notifications in EODistributionContext is now null-pointer safe.

EODatabaseContext sometimes incorrectly ignores the result of the delegate method subEntityForEntity

Apple Reference # 2735570

ISSUE:

When creating a fault for a destination entity that has subentities, EODatabaseContext sometimes ignores the result of the delegate method subEntityForEntity. This can lead to an unnecessary fetch to resolve the ambiguity about the exact entity for the fault.

RESOLUTION:

EODatabaseContext now uses the result of the delegate method subEntityForEntity to determine the final subentity for the destination object.

WORequest formValueForKey( ) should return Object, not String

Apple Reference # 2736189

ISSUE:

In some cases a form needs to return a value different than a String, e.g. in WOFileUpload. In such cases there is no way to get the proper value unless the type returned is Object.

RESOLUTION:

The return type for `WORequest.formValueForKey()` has been changed to Object. This change requires developers using the `formValueForKey()` method to modify their code. New methods have been added to allow developers to retrieve specific value types:

```
public String stringFormValueForKey( String aKey )

public Number numericFormValueForKey( String aKey, NSNumberFormatter numericFormatter )

public NSTimestamp dateFormValueForKey( String aKey, NSTimestampFormatter dateFormatter )
```

Applications which previously called `formValueForKey()` to retrieve a String value should be changed to call the new method `stringFormValueForKey()` instead.

Display Group Component lacks button icons

Apple Reference # 2745375

ISSUE:

The Display Group Assistant does not add all required graphics to the project.

RESOLUTION:

The Display Group Assistant now correctly adds all button graphics to the project.

IIS adaptor cannot upload a file larger than 64 KB

Apple Reference # 2747535

ISSUE:

Due to a problem in the native ISAPI call ReadClient, the WebObjects IIS adaptor could not upload a file larger than 64 KB.

RESOLUTION:

The IIS adaptor now works around the bug in ReadClient and can upload files larger than 64 KB.

Exception when using distributionContext binding on WOJavaClientApplet

Apple Reference # 2755813

ISSUE:

WOJavaClientApplets have a binding "distributionContext" which can be used to return a special EODistributionContext (or a subclass of it). There was a problem causing exceptions when this binding was used.

RESOLUTION:

The problem has been fixed and the distributionContext binding can now be used to create EODistributionContext instances.

Client arguments incomplete on client-side in Java Client

Apple Reference # 2765206

ISSUE:

Some arguments needed to initialize EOF completely were not sent to the client in some situations. Most applications were probably unaffected, but there might have been issues with temporary global IDs if many clients were used.

RESOLUTION:

The problem has been fixed and EOF is now completely initialized .

Launch scripts are generated badly on Windows

Apple Reference # 2769581

ISSUE:

If you build an application on Windows and transfer it to a Mac OS X system, it will not run because of the following two issues:

1. The launch script is not executable, and you will get a permission denied error.
2. The classpath file had Windows linebreaks (CTRL-Ms), and so wouldn't launch.

However, the reverse (moving an application from Mac OS X to Windows) works well.

RESOLUTION:

1. There is no way to guarantee that permissions are preserved when transferring files. The 'chmod' command can be used to make the launch script executable.
2. The Mac OS X launch scripts now strip out any CTRL-M characters from the classpath file.

EOModeler gives "No Reason Provided" when reverse engineering a database

Apple Reference # 2773149

ISSUE:

There is an issue with the version of OpenBase that ships with WebObjects 5 that wasn't handled in a robust manner.

RESOLUTION:

Tables are now correctly reverse engineered from OpenBase databases. However, relationships are not reverse engineered and will need to be created in EOModeler.

Can't update Oracle LOBs

Apple Reference # 2772901

ISSUE:

Inserting an Oracle CLOB or BLOB works. However, trying to update that LOB fails with an exception "com.webobjects.jdbcadaptor.JDBCAdaptorException: Expected a LOB count of 2 but could not fetch that many objects". This is caused by an error in the generated SQL statement that attempts to update the LOB.

RESOLUTION:

The update now generates the correct SQL statement so that the Oracle LOB will be updated as expected.

Sorting: JDK compareTo() not compatible with NSComparator

Apple Reference # 2727709

ISSUE:

NSComparator expects {-1,0,1}, but the JDK compareTo() methods return different values which more loosely conform to { < 0, 0, > 0 }. Developers attempting to use compareTo() while implementing methods used by NSComparator will experience incorrectly sorted results.

RESOLUTION:

NSComparator now accepts less well defined input.

Cannot use char with OpenBase > 254 characters

Apple Reference # 2750823

ISSUE:

The meta data (type information) WebObjects uses for OpenBase is incorrect. The precision for char types has been increased to 4096 (as supported in OpenBase v6.5.7).

RESOLUTION:

WebObjects now has the OpenBase metadata in a file which is current for OpenBase v6.5.7. The file is in `/System/Library/Frameworks/JDBCEOAdaptor.framework/Resources/Info-macos.plist` for EOModeler and `/System/Library/Frameworks/JavaJDBCAdaptor.framework/Resources/Info.plist` for WebObjects applications.

Fetching OpenBase metadata (type information) hangs

Apple Reference # 2750824

ISSUE:

OpenBase expects a non-standard commit() after an invocation of getMetaData() on its JDBC Connection class. Otherwise, a transaction is left open, which can later cause a client application to hang.

RESOLUTION:

WebObjects now has the OpenBase metadata in a file which is current for OpenBase v6.5.7. The file is in `/System/Library/Frameworks/JDBCEOAdaptor.framework/Resources/Info-macos.plist` for EOModeler and `/System/Library/Frameworks/JavaJDBCAdaptor.framework/Resources/Info.plist` for WebObjects applications.

Corrected in WebObjects 5 Update 1

WOB hangs after quitting ProjectBuilder

Apple Reference # 2695877

ISSUE:

Quitting ProjectBuilder with unsaved components open in WOB would result in WOB hanging.

RESOLUTION:

Quitting ProjectBuilder now has no effect on WOB.

WOB crashes after project manipulations in ProjectBuilder

Apple Reference #2695881

ISSUE

Under certain circumstances WOB could crash after receiving project update messages from ProjectBuilder.

RESOLUTION

This problem has been fixed.

Using lots of WOComponents from non-project frameworks like JavaWOExtensions.framework causes slow performance during rapid turnaround

Apple Reference #2695952

ISSUE:

The resource name/path caches used by rapid turnaround might be improperly invalidated in some cases, causing them to be refreshed too often. In the case of projects that use lots of reusable components, particularly those projects that link against many frameworks, these extra refreshes significantly slow performance. There is no such performance issue for deployed applications.

RESOLUTION:

Rapid turnaround performance in this configuration has been significantly improved.

Can't switch adaptor in EOModeler when the inspector window is open

Apple Reference #2700580

ISSUE:

If the inspector window has been opened, it will be impossible to switch the adaptor or set the adaptor info from the file menu. The inspector continually puts the old values back into the model.

RESOLUTION:

The connection dictionary inspector window now allows you to switch the adaptor and set adaptor info.

Dragging an Entity from EOModeler into WOB would not copy model correctly

Apple Reference #2700581

ISSUE:

Because WOB would not see the model in the project, it would attempt to add it multiple times. In certain circumstances the .eomodeld file could end up being deleted.

RESOLUTION:

WOB and ProjectBuilder now handle the .eomodeld correctly in this case.

ParseException while using EOQualifier.qualifierWithQualifierFormat()

Apple Reference # 2702519

ISSUE:

One would see an exception like:
[com.webobjects.eocontrol._private.ParseException] Encountered "and" at line 1, column 38. Was expecting: ")" .... This happened when trying to use a compound qualifier within a parenthetical expression.

RESOLUTION:

EOQualifier.qualifierWithQualifierFormat() now correctly handles this case.

Formatters were not created for Java Client detail relationship controls

Apple Reference # 2703810

ISSUE:

When the assistant on Mac OS X created a JavaClient nib, the formatter would not be applied to the detail-side controls of a master-detail relationship.

RESOLUTION:

Formatters are now created properly for master-detail relationship controls.

Prototypes do not work

Apple Reference # 2703989

ISSUE:

At runtime, a NullPointerException would be raised when a model using prototype attributes was loaded.

RESOLUTION:

Models with prototype attributes will now work as expected.

To-many relationships not displayed properly in WOB's variables browser

Apple Reference # 2704287

ISSUE:

To-many relationships in eomodels were not properly displayed as aggregate keys.

RESOLUTION:

WOB now displays these relationships accurately.

EOEditingContextDidSaveChanges notification has bad userInfo dictionary

Apple Reference # 2707102

ISSUE:

EOEditingContext mistakenly put the wrong objects in the userInfo dictionary for the notification.

RESOLUTION:

This has been corrected.

In some cases, one cannot catch an NSValidation.ValidationException

Apple Reference # 2707105

ISSUE:

In a few places within EOControl, validation exceptions were erroneously being placed within an NSForwardException instead of simply being rethrown.

RESOLUTION:

These validation exceptions are now simply rethrown.

An exception in an action causes a NullPointerException in the Exception Page display page itself.

Apple Reference # 2707125

ISSUE:

The exception display page failed to initialize its own state correctly.

RESOLUTION:

This has been corrected.

With entity inheritance, NullPointerException in EODatabaseContext.arrayFaultWithSourceGlobalID()

Apple Reference # 2708798

ISSUE:

In some situations while using entity inheritance, the EOGlobalID used for a fault would not become final when necessary, leaving it in an inconsistent state. Eventually, use of this EOGlobalID object would cause a crash.

RESOLUTION:

The EOGlobalID now becomes final appropriately.

Object graphs not kept in sync with entity inheritance in Java Client

Apple Reference # 2708954

ISSUE:

Due to a problem in the EODistribution layer, the client side of Java Client applications did not recognize inverse relationships of inherited entities correctly. As a result, methods like addObjectToBothSidesOfRelationshipWithKey were not functional on the client side.

RESOLUTION:

The EODistribution layer now correctly identifies inverse relationships even with entity inheritance.

Rapid turnaround does not work properly with frameworks

Apple Reference # 2709211

ISSUE:

WOB was not finding framework projects that were open in ProjectBuilder. This resulted in some keys and actions not showing up in the variables browser. The framework must be installed in the system and its project open in ProjectBuilder in order for WOB to find it.

RESOLUTION:

WOB now finds framework projects that are open in ProjectBuilder.

EOCustomObject does not work with deferred faulting

Apple Reference # 2709919

ISSUE:

Due to a problem in the EOAccess layer, using public accessor methods for to-one relationships (for example, public void setStudio(Studio value)) and deferred faulting (for example, subclasses of EOGenericRecord with explicit public accessors or subclasses of EOCustomObject with deferred faulting explicitly turned on) did not work and produced IllegalArgumentExceptions when objects were initialized. Also, if you have a relationship to an abstract entity, the object class representing that abstract entity in memory cannot be declared abstract (you can declare the entity abstract in the EOModel, but not the class used for that entity).

RESOLUTION:

This has been corrected, but you cannot use abstract classes for abstract entities.

EOCustomObject does not work with deferred faulting in Java Client

Apple Reference # 2709931

ISSUE:

Due to a problem in the client side EODistribution layer, using public accessor methods for to-one relationships (for example, public void setStudio(Studio value)) and deferred faulting (for example, subclasses of EOGenericRecord with explicit public accessors or subclasses of EOCustomObject with deferred faulting explicitly turned on) did not work and produced IllegalArgumentExceptions when objects were initialized. Also, if you have a relationship to an abstract entity, the object class representing that abstract entity in memory cannot be declared abstract (you can declare the entity abstract in the EOModel, but not the class used for that entity).

RESOLUTION:

This has been corrected, but you cannot use abstract classes for abstract entities.

Unable to create a WOCookie that expires when the browser window is closed

Apple Reference # 2712534

ISSUE:

The main non-deprecated WOCookie constructor (the one with six arguments) specifies timeouts, which specify values for the "max-age" header for a cookie. The "max-age" header doesn't support the old cookie feature wherein a cookie can be expired upon closing of a browser window. However, the old "expires" header does support the expire-on-browser-window-close behavior, in that a missing "expires" header indicates the behavior. Unfortunately, "max-age" supercedes the "expires" header (present or not) if the "max-age" header is present.

RESOLUTION:

In order to take advantage of the expire-on-browser-window-close feature, you must do the following. If you invoke the non-deprecated, six-argument WOCookie constructor (the one that uses an int timeout instead of an NSTimestamp date), specify a "-1" value for the timeout parameter. If you use the two-argument constructor, there's nothing more to do, because it already specifies a "-1" value for the timeout parameter. Then, as you did in previous WebObjects releases, ensure that you avoid calling setExpires on the WOCookie object you get back from the constructor, or make sure that you call "setExpires(null)" on the WOCookie object before using it. This will prevent the WOCookie object from generating either a "max-age" or an "expires" header, which will indicate the expiration behavior you desire. For example:
WOCookie cookie = new WOCookie ("cookieName", "cookieValue", "/", null, -1, false);
cookie.setExpires(null);

Client-side jars are not copied into doc root on Mac OS X Server

Apple Reference # 2719079

ISSUE:

Installing WebObjects 5 Deployment on Mac OS X Server installs the client-side jars and other files needed on the web server into a temporary directory on the system, but does not move them to the web server's doc root.

RESOLUTION:

WebObjects 5 Deployment Update 1 installs the updated client-side files that are part of the update into the temporary directory and then correctly moves all the files into the web server's doc root.

Published Date: Oct 10, 2016

WebObjects 4.5.1: WebObjects 4.5.1 Update 3 Overview

Note: This document has been superseded. Refer to article 70037: "**WebObjects Current Patch List**", for information on the most current updates for WebObjects. This article is provided here as a convenience to our customers who have not yet upgraded to the most current update.

This document contains an overview and download information for Apple's Update 3 for WebObjects Release 4.5.1. This update corrects the known incompatibilities between WebObjects 4.5.1 and Mac OS X 10.1 and is required on that platform. This update should not be installed on Mac OS X versions earlier than 10.1.

WebObjects 4.5.1 Update 3 includes all of the fixes from **WebObjects 4.5.1 Update 2**. If you have already installed WebObjects 4.5.1 Update 2, you can install Update 3 over your existing installation. If you have not installed Update 2, you do not need to install it prior to installing Update 3.

The **WebObjects Current Patch List**, document 70037, contains information on all available patches and updates for all versions of WebObjects. Please read this document if you're not sure which updates you need on your system.

This article has been archived and is no longer updated by Apple.
This update includes modified WebObjects HTTP Adaptor binaries. On Mac OS X (Server) 10.1 and later, the update installer automatically places the modified adaptor binaries in the appropriate Web server directory. The update also includes a complete set of updated adaptor source files to match the modified binaries.

If you attempt to rebuild the Apache adaptor, you will see an "Undefined symbols" link error related to the two level namespace changes in Mac OS X 10.1 (Apple reference #2795562). In order to build this adaptor successfully on Mac OS X 10.1, you will need to add the linker flag "-flat_namespace". This can be added in ProjectBuilderWO using the Build Attributes panel in the Project Inspector.

WebObjects 4.5.1 Update 3 for Mac OS X (Server) 10.1 and later

There are two mutually exclusive updates for this platform. If you have WebObjects 4.5.1 Developer installed on Mac OS X, you need WebObjects 4.5.1 Developer Update 3. If you have WebObjects 4.5.1 Deployment installed on Mac OS X Server, you need WebObjects 4.5.1 Deployment Update 3. You do not need both on any system.

This update is available through the Software Update feature of Mac OS X. If you use this method, only the proper update for the software which you have installed on your system will be visible and available for download. If you prefer to download and install the package manually, follow the instructions below.

Note: WebObjects 4.5.1 Developer Update 3 requires Mac OS X 10.1.1 or later plus the 10-19-01 Security Update as well as the Mac OS X 10.1 Development Tools. WebObjects 4.5.1 Deployment Update 3 requires Mac OS X Server 10.1.1 or later plus the 10-19-01 Security Update and the 10.1.1 Server Update. If you have not updated to the correct version of Mac OS X (Server), you must do so before installing WebObjects 4.5.1 Update 3.

If you are creating a new Mac OS X WebObjects 4.5.1 development system, you should install the software in the following order:

1. Mac OS X 10.1
2. Mac OS X 10.1 Development Tools
3. 10-19-01 Security Update
4. 10.1.1 Update
5. WebObjects 4.5.1 Developer
6. WebObjects 4.5.1 Developer Update 3

If you are upgrading an existing Mac OS X 10.0.x WebObjects 4.5.1 development system, you should install the software in the following order:

1. Mac OS X 10.1 upgrade
2. Mac OS X 10.1 Development Tools
3. 10-19-01 Security Update
4. 10.1.1 Update
5. WebObjects 4.5.1 Developer Update 3

Important: Whether you are using Software Update or installing the update manually, you must be logged in as "root" user in order to perform the installation. Logging in as "Administrator", or authenticating as "root" is insufficient. Failure to follow this requirement will result in an installation failure. You must also ensure that no WebObjects or EOF applications are running during the installation of the update.

Manually Installing WebObjects 4.5.1 Update 3 on Mac OS X (Server) 10.1

These instructions are for manually downloading and installing WebObjects 4.5.1 Update 3. If you are installing using Software Update, see the section titled "WebObjects 4.5.1 Update 3 for Mac OS X (Server) 10.1", above.

Note: The Developer update requires Mac OS X 10.1.1 or later plus the 10-19-01 Security Update as well as the Mac OS X 10.1 Development Tools. The Deployment update requires Mac OS X Server 10.1.1 or later plus the 10-19-01 Security Update and the 10.1.1 Server Update. If you have not updated to the correct version of Mac OS X (Server), you must do so before installing WebObjects 4.5.1 Update 3.

1. Download WO451MacOSXDevUpdate3.pkg.tar, the update installer for WebObjects 4.5.1 Developer on Mac OS X 10.1, or WO451MacOSXDepUpdate3.pkg.tar, the update installer for WebObjects 4.5.1 Deployment on Mac OS X Server 10.1.
The updates are available from:

FTP:

ftp://ftp.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/4.5.1/WO451MacOSXDevUpdate3.pkg.tar

HTTP:
http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/4.5.1/WO451MacOSXDevUpdate3.pkg.tar

2. Untar the update package.
Your web browser or FTP client may perform this step for you.

3. Double-click on the update package you downloaded in step 1.
The Authorization panel will open.

4. You need to install the update as root. If you do not have the Administrator password, see your system administrator. Click the lock icon at the bottom left of the panel to authenticate as the root user. Enter Name: "root" and Password: "<root password>" and click the OK button.

Important: You have to be logged in as "root" user in order to perform the installation. Logging in as "Administrator", or authenticating as "root" is insufficient. Failure to follow this requirement will result in an installation failure.

5. Click Continue in the Introduction panel.

6. Read the software license agreement then click Continue.

7. To agree to the license and continue the installation, click Agree.

8. Select the volume that contains Mac OS X (Server) and WebObjects 4.5.1, then click Continue.

9. Make sure that there are no WebObjects or EOF applications running.

10. Click Install to proceed with installation.
The Installer window displays information about the progress of the installation, which may take several minutes.

11. Restart your computer.

Corrected in WebObjects 4.5.1 Update 3

wotaskd sometimes returns content length 0

Apple Reference 2744196

ISSUE:

On Mac OS X 10.1 wotaskd sometimes returns empty content for all requests, depending on how it is started.

RESOLUTION:

This problem has been corrected.

ObjC apps raise when running on Mac OS X 10.1

Apple Reference 2757892

ISSUE:

In Mac OS X 10.0.x, immutable collections in Foundation were implemented as mutable collections. In Mac OS X 10.1, the collection implementations were changed so that immutable collections were actually immutable. This change was incompatible with WebObjects 4.5.1.

RESOLUTION:

WebObjects.framework now uses a compatibility mode in Foundation in which all collections are mutable.

WebObjects Builder broken after upgrading to Mac OS X 10.1

Apple Reference 2782527

ISSUE:

The upgrade installer for Mac OS X 10.1 removes HTMLEditing.framework from the system. Since WebObjects Builder depends on this framework, it will no longer run. Upon launching WebObjects Builder, you will see the following error message:

dyld: /Developer/Applications/WebObjects Builder.app/Contents/MacOS/WebObjects Builder can't open library:
/System/Library/PrivateFrameworks/HTMLEditing.framework/Versions/A/HTMLEditing
(No such file or directory, errno = 2)

RESOLUTION:

The update installs the version of HTMLEditing.framework shipped with WebObjects 4.5.1.

"Save as" does not change the name in the title bar for a model

Apple Reference 2796022

ISSUE:

After performing a "Save as" operation, EOModeler does not change the name of the model in the window title bar.

RESOLUTION:

The window title bar now properly reflects the new name of the model.

WOSendMail calls obsolete methods on NSUserDefaults

Apple Reference 2798848

ISSUE:

WOSendMail calls several obsolete NSUserDefaults methods, which caused warning messages to be printed.

RESOLUTION:

WOSendMail no longer calls the obsolete methods.

wotaskd and Monitor run with unexpected defaults on Mac OS X 10.1

Apple Reference 2802265

ISSUE:

The user defaults system changed between Mac OS X 10.0.x and Mac OS X 10.1. This causes Monitor and wotaskd to run with an unexpected set of defaults.

RESOLUTION:

Monitor and wotaskd have been modified to work properly with the user defaults system on Mac OS X 10.1.

Corrected in WebObjects 4.5.1 Update 2

Wrong Swing method in IB code generation for NSTableView

Apple Reference 2453148

ISSUE:

Swing code generated by InterfaceBuilder improperly uses setWidth instead of setPreferredWidth for NSTableView.

RESOLUTION:

This has been corrected.

woservice has a small memory leak

Apple Reference 2491807

ISSUE:

woservice has a small memory leak each time it launches the application it watches.

RESOLUTION:

The leak has been removed.

WOSession leaks an ivar

Apple Reference 2503730

ISSUE:

WOSession leaked an ivar when deallocated.

RESOLUTION:

This has been corrected.

NSAttributeDictionary methods crash if +initialize hasn't completed

Apple Reference 2529298

ISSUE:

A multithreaded application can crash if NSAttributeDictionary methods are called before its +initialize method has finished executing.

RESOLUTION:

NSAttributeDictionary is now initialized early in the application's startup.

Snapshot ref counting problem when inserting into and deleting parent/child ECs

Apple Reference 2609375

ISSUE:

Certain sequences of operations involving nested editing contexts can cause problems with the snapshot reference count.

RESOLUTION:

Snapshot reference counts are now properly maintained. Correcting this problem required adding an instance variable to the EOEditingContext class, changing the size of an

EOEditingContext instance. This breaks binary compatibility for customers that subclass EOEditingContext and add ivars. Customers who do this must recompile.

direct action URL generation missing instance numbers

Apple Reference 2616937

ISSUE:

Under certain circumstances WebObjects would not include an instance number when generating a URL for a direct action. This could cause the WebObjects adaptor to load balance to a different instance which does not contain the user's session.

RESOLUTION:

URL generation for direct actions has been modified to preserve the instance number when appropriate.

Monitor/wotaskd could not tell the difference between Mac OS X Server 1.2 and Mac OS X Server 10.0.x

Apple Reference 2657074

ISSUE:

Monitor/wotaskd used a compile time method to determine the OS reported in Monitor's Hosts page. A Mac OS X 10.0.x machine was reported as Mac OS X Server.

RESOLUTION:

Mac OS X (Server) 10.0.x now reports the information in /System/Library/CoreServices/SystemVersion.plist. Mac OS X Server 1.2 will report as "Mac OS X Server".

Server-side WebAssistant launch line incorrect

Apple Reference 2661845

ISSUE:

If your DirectToWeb application uses '-D2WWebAssistantEnabled YES' as a command line argument rather than programmatically setting it after the application has finished launching, the port number will not yet be set and the server-side WebAssistant launch line will print with the incorrect port number -1, as in the following example:

```
appletviewer http://localhost:-1/cgi-bin/WebObjects/Administrate.woa/wa/D2WActions/openWebAssistant
```

RESOLUTION:

Specify a real port number in the appletviewer launch command, or specify a port at launch using the -WOPort <#> command line argument.

Adding an object to an owns relationship always puts it in the "inserted" list

Apple Reference 2663566

ISSUE:

Adding an object which has already been saved to an owns relationship always puts it in the list of 'inserted' objects. This creates an inconsistency when saving changes.

RESOLUTION:

EOControl has been modified to check whether the object is already in the editing context before adding it to the inserted list.

Sessionless direct action development apps inaccessible via web server

Apple Reference 2663739

ISSUE:

An instance of a sessionless direct action application does not include the instance id in the URL generated by WOHyperlink. As a result, this type of application is not accessible through the WebObjects web server adaptor when running as a development instance.

RESOLUTION:

URL generation has been modified to include the instance number for development instances.

Adaptor XML parser can crash with bad syntax

Apple Reference 2664670

ISSUE:

Certain textual formatting errors in the XML configuration file for the WebObjects HTTP adaptor can cause the adaptor to crash. (Note that wotaskd produces correct XML, so this only applies if a file is being used to configure the adaptor.)

RESOLUTION:

The XML parser has been modified to correctly handle the case that was causing the crash.

CreatePlots and LongRequest examples fail to clean or build on MOSXS 1.2

Apple Reference 2667045

ISSUE:

These two examples cannot be cleaned or built on Mac OS X Server 1.2 because the path to gnumake defined in PB.project is incorrect for this platform.

RESOLUTION:

The PB.project files for these two examples have been corrected.

NSUnarchive exception when running SetupWizard.app in the EOF Examples on MacOS X Server 1.2

Apple Reference 2673597

ISSUE:

The nibs in the EOF examples were corrupted in the shipping version of WebObjects 4.5.1.

RESOLUTION:

The update replaces the corrupted nibs with the correct files.

Time zone updates missing on Windows

Apple Reference 2678768

ISSUE:

Several files needed to resolve the issues originally resolved in WebObjects 4.0.1 Patch 2 and WebObjects 4.5 Update 3 (see Apple reference #2406610 in either update overview in the Knowledge Base for details) were omitted from WebObjects 4.5.1 on the Windows platform only.

RESOLUTION:

This update includes the missing files for Windows.

Update 4.5.1 adaptor to 5.0 GM version

Apple Reference 2691647

ISSUE:

Some changes were made to the WebObjects adaptor between the WebObjects 4.5.1 release and the WebObjects 5.0 release.

RESOLUTION:

This update includes all the source changes to the WebObjects adaptor up to the WebObjects 5.0 release. (This update also includes changes which were made after the WebObjects 5.0 release. These are documented separately.)

EOTextAssociation does not recognize Mac OS X rtf header "{\\\\rtf1" and throws an exception

Apple Reference 2695698

ISSUE:

New RTF data generated on Mac OS X 10.0.x uses the header "{\\\\rtf1" where previous WebObjects platforms used "{\\\\rtf0".

RESOLUTION:

EOTextAssociation has been updated to handle the new RTF signature properly.

WebObjects 4.5.1 adaptor source won't compile on MOSXS 1.2

Apple Reference 2696008

ISSUE:

The Mac OS X Server 1.2 installation includes sources for the WebObjects 4.0.1 adaptor. Installing the WebObjects 4.5.1 adaptor on a system with the 4.0.1 sources results in an incompatible mix of files from the two versions.

RESOLUTION:

This update removes any existing installed adaptor source on Mac OS X Server 1.2 and Mac OS X (Server) 10.0.x. The full WebObjects adaptor source is included in the update and installed on all platforms.

EOPalette raises when opening connection inspector

Apple Reference 2732969

ISSUE:

EOPalette sometimes raised an exception when the user selected the Connections inspector. This prevented the developer from changing or creating connections in existing nib files.

RESOLUTION:

This has been corrected.

Corrected in WebObjects 4.5.1 Update 1

WebObjects 4.5.1 Update 1 was applicable only to Mac OS X 10.0.x systems with WebObjects 4.5.1 Developer installed. It did the following:

- created the file /System/Library/WebObjects/Configuration/WebServerConfig.plist, which is needed to do a "split install" of your WebObjects application from

ProjectBuilderWO on a developer system.

- updated precompiled headers.
- created the missing documentation links mentioned in the Readme.rtf on the CD.

Published Date: Feb 19, 2012

WebObjects 5: Deployment License Key Is Not Recognized By Installation Script

Solaris, Linux and other UNIX-style platforms translate the file and directory names on the WebObjects Deployment CD-ROM to lower case when the CD is mounted. This prevents the installer script from finding the correct Java files it needs to verify the WebObjects license key. The installer script expects the files and directories to be mixed case (upper and lower case).
This article has been archived and is no longer updated by Apple.

Symptom

The installer script does not recognize a valid license key under Solaris, Linux or other UNIX-style platform.

Solution

Modify how the operating system mounts the CD-ROM, so that the file and directory names aren't translated. Instructions for modifying the operating system are listed below. If your Operating System is not listed below, consult your operating system's documentation for more information.

Solaris (2.8)

1. If the WebObjects 5 CD is in the CD-ROM drive, eject it.
2. Log in as root.
3. As root, edit `/etc/rmount.conf` and look for the heading `# Mount`
4. Add the option "nomaplcase" to the mount options:

```
# Mount
mount * hsfs udfs ufs -o nosuid,nomaplcase
```

5. Save the file
6. Reinsert the WebObjects 5 CD.
7. The installation should proceed normally.

Linux (RedHat >6.2)

1. If the WebObjects 5 CD is currently mounted, unmount it.
2. Log in as root.
3. As root, manually mount the CD adding "map=off" to the command:

```
# mount -t iso9660 -o ro,nosuid,map=off /dev/cdrom /mnt/cdrom
```

Note: Your options, devices, and mount points may be different according to your hardware configuration.

4. The installation should proceed normally.

Knowledge Base: Language Codes Used

This document contains a explanation of the language codes used in the software download documents in the Knowledge Base.

This article has been archived and is no longer updated by Apple.

Language Codes

The Knowledge Base, with limited exceptions, uses standard ISO-639 language codes. Below is a list of the most common language codes used in the Knowledge Base.

Note: When a single software download can update any language a single letter, Z, is used as the language code.

Language	ISO-639 code	
English	EN	**EN-NA** is used for North American English **EN-Z** is used for International English
French (français)	FR	
German (Deutsch)	DE	
Spanish (Español)	ES	
Italian (Italiano)	IT	
Dutch (Nederlands)	NL	
Japanese	JA	
Norwegian (Norsk)	NO	
Swedish (Svensk)	SV	
Finnish (Suomi)	FI	
Danish (Dansk)	DA	
Brazilian/Portuguese (Portugues Brasileiro)	PT	
Chinese	ZH	**ZH-S** is used for Simplified Chinese **ZH-T** is used for Traditional Chinese
Korean	KO	

Country Codes

The Apple Specifications are published specifically for a country. ISO-1366 country codes are used for each country.

Note: In Europe specifications may be available in multiple languages for a given country.

Country	ISO-3166 code
Australia	AU
Austria	AT
Belgium	BE
Canada	CA
Denmark	DK
Finland	FI
France	FR
Germany	DE
Ireland	IE
Italy	IT
Japan	JP
Netherlands	NL
Norway	NO
South Africa	ZA
Sweden	SE
Switzerland	CH
United Kingdom	GB
United States	US

WebObjects: How to Change Carriage Returns When Porting Applications

This document describes how to convert Windows to UNIX carriage returns when porting WebObjects applications.
This article has been archived and is no longer updated by Apple.
When building a WebObjects application developed on Microsoft Windows and ported to Solaris, sometimes compilation errors, link errors, or runtime errors result. One cause of these types of errors is Microsoft Windows form for indicating a carriage return, which differs from Solaris.

Determining the cause of compilation errors

If your projects build properly on Windows, but on Solaris produces errors like the following, the problem may be Windows-style carriage returns and end of file characters in your source or make files.

```
Undefined symbol   first referenced in file

ologof             /opt/Apple/Local/Library/Frameworks/OracleEOAdaptor.framework/libOracleEOAdaptor.so

.

.

.

ld: fatal: Symbol referencing errors. No output written to /users/install/apps/WOApp.woa/WOApp

make: *** [/users/install/apps/WOApp.woa/WOApp] Error 1
```

Evaluate any listed source files which you had previously edited on Windows and check all of your Makefiles for Windows style control characters such as carriage returns. Windows files and editing tools use carriage return (CR) + line feed (LF) to separate lines of ASCII Text. Solaris uses just line feed (LF).

When tools on Solaris encounter the carriage return characters, the tools can exhibit erratic behavior. You can determine if your files contain these CR characters after moving them to your Solaris system by issuing the following command:

```
cat -v filename
```

You could also open the suspect files in the vi editor to see if the carriage return characters appear.

When a Windows style carriage returns exist, `^M` appears at the end of every line. In order to properly compile your project, you need to strip these characters out of the file. You should run the Solaris dos2unix utility to remove the unwanted CR characters. Detailed information about the dos2unix utility is available on a Solaris computer in the dos2unix man page.

Here's an example of running the dos2unix command which copies all text except carriage returns and Windows end of file characters from *oldfilename* to *newfilename*.

```
dos2unix -ascii oldfilename newfilename
```

If you want to replace the file inline, you can issue the command as follows:

```
dos2unix -ascii filename filename
```

If you wish to run a recursive batch processing of dos2unix on all the files within a directory tree, cd to the directory containing your WebObjects application's PB.project file. Then issue the following command:

```
find . -type f -print | xargs -I {} dos2unix -ascii {} {}
```

Note: You may safely disregard the following warnings issued by the dos2unix command as it does its processing.

```
could not open /dev/kbd to get keyboard type US keyboard assumed

could not get keyboard type US keyboard assumed
```

Other factors can lead to build problems on Solaris including incorrect environment variables and improper installations of frameworks, but attempts to resolve those problems will be futile if your source and make files contain Windows-style carriage returns and end of file characters. After uploading your files from Windows to UNIX in ASCII mode, searching for and removing carriage returns from your source files and makefiles should be the next step you take in your efforts to resolve your build problems.

iTunes: Unable to import copy-protected audio discs

This article has been archived and is no longer updated by Apple.

iTunes is unable to import ("rip") tracks from certain audio discs that have a copy protection system.

Copy protection or dirty or scratched disc?

There's not always an easy way to identify which discs have copy protection. So, verify that you can import tracks from other audio CDs with your CD/DVD drive. If you can import tracks from other CDs, make sure the disc is clean and free from debris and scratches. To clean, wipe the shiny surface with a soft, damp cloth, working from center to edge. If the disc is scratched, it may be unreadable.

Non-standard discs

Discs that adhere to the CD Digital Audio (CDDA) specification will usually display this logo on the disc or disc case:

If the disc does not have this logo, it may not conform to the CDDA standard. Reasons for this can include:

- The disc contains additional multimedia.
- The disc may have been created in a way that does not allow the audio portion to be imported into iTunes (a form of copy protection).
- The disc may contain a specific copyright protection mechanism to prevent reproducing the contents of the disc.

You should contact the manufacturer of the disc for additional assistance with these types of discs and for possible ways to import the audio files onto a computer or iPod.

PowerBook G3 Series: Computer Stops Responding When Using Zip Drive in Drive Bay

After updating to Mac OS 9.2.1 or later, inserting or accessing a Zip drive placed in a PowerBook G3 Series computer drive bay results in the computer no longer responding to mouse clicks or other input.

This article has been archived and is no longer updated by Apple.

Symptom

After updating to Mac OS 9.2.1 or higher, inserting or accessing a Zip drive placed in a PowerBook G3 series drive bay results in the computer no longer responding to mouse clicks or other input.

Solution

1. Open the Extensions Manager control panel.
2. Turn off the Iomega Driver extension.
3. Restart the computer.
4. Open the Iomega Guest application after inserting the drive or disk.

The Iomega Guest application is included as part of the IomegaWare software package, available from Iomega's Web site. (http://www.iomega.com/).

WebObjects 4.5.1: WebObjects 4.5.1 Update 4 Overview

This document contains an overview and download information for Apple's Update 4 for WebObjects Release 4.5.1. Apple recommends that all users of WebObjects 4.5.1 install this update on all platforms.

WebObjects 4.5.1 Update 4 includes all of the fixes from all previous WebObjects 4.5.1 Updates. If you have already installed any WebObjects 4.5.1 Update, you can install Update 4 over your existing installation. If you have not installed any WebObjects 4.5.1 Update, you only need to install Update 4.

The **WebObjects Current Patch List**, document 70037, contains information on all available patches and updates for all versions of WebObjects. Please read this document if you're not sure which updates you need on your system.

This article has been archived and is no longer updated by Apple.
This update includes modified WebObjects HTTP Adaptor binaries. On Mac OS X (Server) 10.1 and later, the update installer automatically places the modified adaptor binaries in the appropriate Web server directory. On Mac OS X Server 1.2, Windows, Solaris, and HP-UX, an extra step is needed to use the new adaptor binaries after installing the update. After the update installer places the modified adaptor binaries in the WebObjects installation, you must manually install them in the correct location for the Web server being used. Refer to the WebObjects documentation for more detailed instructions on how to do this on your system. The update also includes a complete set of updated adaptor source files to match the modified binaries.

If you attempt to rebuild the Apache adaptor on Mac OS X (Server) 10.1.x, you will see an "Undefined symbols" link error related to the two level namespace changes in Mac OS X 10.1 (Apple reference #2795562). In order to build the adaptor successfully on Mac OS X 10.1, you will need to add the linker flag "-flat_namespace". This can be added in ProjectBuilderWO using the Build Attributes panel in the Project Inspector.

WebObjects 4.5.1 Update 4 for Mac OS X (Server) 10.1 and later (Software Update)

There are two mutually exclusive updates for this platform. If you have WebObjects 4.5.1 Developer installed on Mac OS X, you need WebObjects 4.5.1 Developer Update 4. If you have WebObjects 4.5.1 Deployment installed on Mac OS X Server, you need WebObjects 4.5.1 Deployment Update 4. You do not need both on any system.

This update is available through the Software Update feature of Mac OS X. If you use SoftwareÂ Update to install this update, only the proper update for the software which you have installed on your system will be visible and available for download. If you prefer to download and install the package manually, follow the instructions in the section titled "Installing WebObjects 4.5.1 Update 4 on Mac OS X (Server) 10.1 (Manual Download)", below.

Note: WebObjects 4.5.1 Developer Update 4 requires Mac OS X 10.1.3 or later plus the December 2001 Mac OS X Development Tools. WebObjects 4.5.1 Deployment Update 4 requires Mac OS X Server 10.1.3 plus the 10.1.2 Server Update or later. If you have not updated to the correct version of Mac OS X (Server), you must do so before installing WebObjects 4.5.1 Update 4.

If you are creating a new Mac OS X WebObjects 4.5.1 development system, you should install the software in the following order:

1. Mac OS X 10.1
2. Mac OS X 10.1.3 update
3. December 2001 Mac OS X Development Tools
4. WebObjects 4.5.1 Developer
5. WebObjects 4.5.1 Developer Update 4

If you are upgrading an existing Mac OS X WebObjects 4.5.1 development system, you should install the software in the following order:

1. Mac OS X 10.1.3 update
2. December 2001 Mac OS X 10.1 Development Tools
3. WebObjects 4.5.1 Developer Update 4

Important: Whether you are using Software Update or installing the update manually, you must be logged in as "root" user in order to perform the installation. Logging in as "Administrator", or authenticating as "root" is insufficient. Failure to follow this requirement results in a failed installation. You must also ensure that no WebObjects or EOF applications are running during the installation of the update.

Installing WebObjects 4.5.1 Update 4 on Mac OS X (Server) 10.1 (Manual Download)

These instructions are for manually downloading and installing WebObjects 4.5.1 Update 4. If you are installing using Software Update, see the section titled "WebObjects 4.5.1 Update 4 for Mac OS X (Server) 10.1 and later (Software Update)", above.

Note: WebObjects 4.5.1 Developer Update 4 requires Mac OS X 10.1.3 or later plus the December 2001 Mac OS X Development Tools. WebObjects 4.5.1 Deployment Update 4 requires Mac OS X Server 10.1.3 plus the 10.1.2 Server Update or later. If you have not updated to the correct version of Mac OS X (Server), you must do so before installing WebObjects 4.5.1 Update 4.

1. Download WO451MacOSXDevUpdate4.pkg.tar, the update installer for WebObjects 4.5.1 Developer on Mac OS X 10.1, or WO451MacOSXDepUpdate4.pkg.tar, the update installer for WebObjects 4.5.1 Deployment on Mac OS X Server 10.1.The updates are available from:

HTTP:

../WO451MacOSXDevUpdate4.pkg.tar

../WO451MacOSXDepUpdate4.pkg.tar

2. Untar the update package.
Your web browser may perform this step for you.

3. Double-click on the update package you downloaded in step 1.
The Authorization panel opens.

4. You need to install the update as root.
If you do not have the Administrator password, see your system administrator. Click the lock icon at the bottom left of the panel to authenticate as the root user. Enter Name: "root" and Password: "<root password>" and click the OK button.

Important: You have to be logged in as "root" user in order to perform the installation. Logging in as "Administrator", or authenticating as "root" is insufficient. Failure to follow this requirement will result in an installation failure.

5. Click Continue in the Introduction panel.

6. Read the software license agreement then click Continue.

7. To agree to the license and continue the installation, click Agree.

8. Select the volume that contains Mac OS X (Server) and WebObjects 4.5.1, then click Continue.

9. Make sure that there are no WebObjects or EOF applications running.

10. Click Install to proceed with installation.The Installer window displays information about the progress of the installation, which may take several minutes.

11. Restart your computer.

Installing WebObjects 4.5.1 Update 4 on Mac OS X Server 1.2

There are two mutually exclusive updates for this platform. If you have WebObjects 4.5.1 Developer installed, you need WebObjects 4.5.1 Developer Update 4. If you have WebObjects 4.5.1 Deployment installed, you need WebObjects 4.5.1 Deployment Update 4. You do not need both on any system.

1. Download WO451MOSXSDevUpdate4.pkg.tar, the update installer for WebObjects 4.5.1 Developer on Mac OS X Server 1.2, or WO451MOSXSDepUpdate4.pkg.tar, the update installer for WebObjects 4.5.1 Deployment on Mac OS X Server 1.2.The updates are available from:

HTTP:

../WO451MOSXSDevUpdate4.pkg.tar

../WO451MOSXSDepUpdate4.pkg.tar

2. Untar the update package.
Your web browser may perform this step for you.

3. Log in as root on your Mac OS X Server 1.2 system.

If you're not sure how to log in as root, see your system administrator.

4. Double-click on the update package you downloaded in step 1.

5. Click the Install button in the Installer package window.
An Install Package panel opens.

6. Make sure that there are no WebObjects or EOF applications running.

7. Click 'Install' in the Install Package panel and, when prompted for confirmation, click OK to proceed. The Installer window displays information about the progress of the installation, which may take several minutes.

8. If desired, manually install the updated .jar file needed to resolve "WOCollapsibleContent doesn't initialize correctly (Apple reference #2709677)" by copying them to your web server's document root as described in detail in the release note below.

9. When the installation completes, restart the computer.
Log out and use the reboot button on the login panel.

Installing WebObjects 4.5.1 Update 4 on Windows NT 4.0 or Windows 2000

There are two mutually exclusive updates for this platform. If you have WebObjects 4.5.1 Developer installed, you need WebObjects 4.5.1 Developer Update 4. If you have WebObjects 4.5.1 Deployment installed, you need WebObjects 4.5.1 Deployment Update 4. You do not need both on any computer.

1. Download WO451WinDevUpdate4.exe, the self-extracting update installer for WebObjects 4.5.1 Developer on Windows, or WO451WinDepUpdate4.exe, the self-extracting update installer for WebObjects 4.5.1 Deployment on Windows.
The updates are available from:

HTTP:

../WO451WinDevUpdate4.exe

../WO451WinDepUpdate4.exe

2. Log in as a user with Administrator privileges.

3. Make sure that there are no WebObjects or EOF applications running.

4. Double-click on the update installer you downloaded in step 1 to start the installation process.
A screen with information about this update appears.

5. Read the update information.

6. Click "Next" to continue.

7. The license agreement for this update appears.
To agree to the license and continue the installation, click "Yes".

8. The update will be installed on your computer and you will be asked if you want to restart.
Select "Yes, I want to restart my computer now" to restart your computer. There will be a brief delay while the WinZip self-extractor removes its temporary files.

9. If desired, manually install the updated .jar file needed to resolve "WOCollapsibleContent doesn't initialize correctly (Apple reference #2709677)" by copying them to your web server's document root as described in detail in the release note below.

Installing WebObjects 4.5.1 Update 4 on Solaris and HP-UX

1. Download WO451SolarisUpdate4.TAR.Z, the update installer for Solaris, and/or WO451HPUXUpdate4.TAR.Z, the update installer for HP-UX.
You will also need to download the update installation script, patcher.sh.
The updates are available from:

HTTP:

../WO451SolarisUpdate4.TAR.Z

../WO451HPUXUpdate4.TAR.Z

The installation script is available at:
../Enterprise/scripts/patcher.sh

After you have downloaded the files, the patcher.sh script needs its executable bit set. At the command prompt enter:

chmod 511 patcher.sh

2. Log in as root.

3. Make sure that there are no WebObjects or EOF applications running, including Monitor.

4. If a web server is running on the computer on which you are installing the update, stop it.

5. Stop WebObjects services (wotaskd and woservice) using the WOServices script.
At the command prompt enter:
cd $NEXT_ROOT/Library/WebObjects/Executables
./WOServices stop

These services will be restarted when you restart after installing the update.

6. To Install the update, cd to the directory containing the update and the patcher.sh installation script.
At the command prompt enter:

patcher.sh -install WO451SolarisUpdate2.TAR.Zorpatcher.sh -install WO451HPUXUpdate2.TAR.Z

For more information on using patcher.sh, at the command prompt enter:
patcher.sh -help

7. If desired, manually install the updated .jar file needed to resolve "WOCollapsibleContent doesn't initialize correctly (Apple reference #2709677)" by copying them to your web server's document root as described in detail in the release note below.

8. Restart your computer.

Corrected in WebObjects 4.5.1 Update 4

Test configuration data left in obj.conf file for the NSAPI adaptor

Apple Reference 2420536

ISSUE:

Some test configuration data was left in the sample obj.conf file for the NSAPI plugin adaptor.

RESOLUTION:

The extra text has been removed.

Monitor Adaptor settings are inconsistent between display, Monitor, and Adaptor

Apple Reference 2464532

ISSUE:

Adaptor settings in Monitor were displayed as integers but stored as decimals. They were then sent as decimals to the adaptor, where they were translated back to integers.

RESOLUTION:

Monitor now stores adaptor settings as integers.

ISAPI does not upload files larger than 64k

Apple Reference 2488931

ISSUE:

Some customers have reported receiving socket errors ("socket not connected") when attempting to upload large files using the ISAPI adaptor.

RESOLUTION:

The ISAPI adaptor has been modified to allow successful uploading of files larger than 64 KB.

Oracle adaptor raises with pessimistic locking

Apple Reference 2512093

ISSUE:

Fetching objects using pessimistic locking and then attempting to save changes to the fetched objects results in the Oracle adaptor raising an exception. The exception says "attempted to begin a transaction within a transaction".

RESOLUTION:

EOF has been modified to not begin a new transaction when saving changes to an object that was fetched with pessimistic locking enabled.

WOCollapsibleContent doesn't initialize correctly

Apple Reference 2709677

ISSUE:

WOCollapsibleContent's -isVisible method incorrectly initializes the visible state when dynamically bound.

RESOLUTION:

This problem has been corrected. This change affects the following file in the WODocument root:

```
$NEXT_ROOT/Library/WebObjects/WODocumentRoot/WebObjects/Java/woextensions.jar
```

This update places an upgraded version of this file in the WebObjects installation. To enable this fix for deployment this file must be manually replaced in the web server document root in the following location:

```
{web server doc root}/WebObjects/Java/woextensions.jar
```

WOMultiThreadedAdaptor hardcodes '256' rather than using FD_SETSIZE

Apple Reference 2730943

ISSUE:

WOMultiThreadedAdaptor uses a hardcoded '256' as a limit for the maximum number of simultaneous open connections, but uses select() along with the FD_SET and related macros to service the connections. On Windows the default FD_SETSIZE is less than 256, so it is possible that on a busy site some connections will be accepted but never serviced.

RESOLUTION:

On the Windows platform only the WebObjects framework has been modified to change the limit for the maximum number of simultaneous open connections to 64. On the other platforms the number remains unchanged at 256.

FD_xxx macros used without locks

Apple Reference 2730945

ISSUE:

The FD_SET and related macros are used by WebObject applications in servicing requests. When the application side adaptor is running multithreaded there may be synchronization issues in its use of these macros. (These issues are most likely to manifest as problems on Windows due to the way the macros are implemented on that platform.)

RESOLUTION:

Locking code has been added to the WebObjects framework to prevent data synchronization issues associated with the FD_xxx macros in the application side adaptor.

WONonBlockingAccept can return 0 on windows

Apple Reference 2730951

ISSUE:

Under heavy load on an MP Windows system, low level socket functions can be blocked because of interaction between the NT/MP code and the NIC. This can cause an incorrect value (0) to be returned from accept() to WebObjects applications.

RESOLUTION:

A Windows specific change has been made to the WebObjects framework to detect and work around this situation.

Monitor identified P4 processor as PowerPC (603e)

Apple Reference 2731079

ISSUE:

Wotaskd running on Microsoft Windows would report the processor as a PowerPC 603e when the real processor was a P4.

RESOLUTION:

This problem has been corrected.

HTTP Adaptors catch wrong error message on Microsoft Windows

Apple Reference 2751677

ISSUE:

The WebObjects adaptor uses the error codes EPIPE and EMSGSIZE when checking return values from certain system calls. These are incorrect on the Windows platform.

RESOLUTION:

The adaptor has been changed to use WSACONNECTABORTED and WSAEMSGSIZE on Windows instead.

WOHyperlink queryDictionary/fragmentIdentifier combo results in wrong HTML

Apple Reference 2789133

ISSUE:

In some circumstances the WebObjects framework generates URLs which have the query string and fragment identifier interchanged.

RESOLUTION:

This problem has been corrected.

WOAdaptor does not set request->content when request->method is not 'POST'

Apple Reference 2793625

ISSUE:

If the request method is other than 'POST' and the request content length is nonzero, the request content is not properly initialized. This can cause a web server crash.

RESOLUTION:

The request content is now properly initialized in this case.

Buffer overflow in WOAdaptors

Apple Reference 2795823

ISSUE:

The WebObjects adaptor code allocates a buffer which could be one byte too small. This could cause a one byte buffer overrun if a very long host name is used.

RESOLUTION:

This problem has been corrected.

Instance launched on the wrong host

Apple Reference 2796516

ISSUE:

There was a race condition where an incoming lifebeat could cause wotaskd to launch an instance on the wrong host.

RESOLUTION:

This problem has been corrected.

malloc off-by-one in adaptors

Apple Reference 2802333

ISSUE:

The WebObjects adaptor allocates a buffer which is one byte too small.

RESOLUTION:

This problem has been corrected.

Monitor becomes unusable when server is down

Apple Reference 2823824

ISSUE:

Several of Monitor's pages (Hosts, Applications, DetailPage) attempt to contact each host's wotaskd for each instance configured. This causes Monitor to be very slow to respond when a server is down.

RESOLUTION:

Monitor has been changed to cache the state of hosts and instances. The cache timeouts can be changed using the defaults mentioned below. During development you will likely want to set the timeouts to a lower value.

WOMonitorHostCacheTimeout	40 seconds by default
WOMonitorInstanceCacheTimeout	25 seconds by default

old Foundation version installed

Apple Reference 2830592

ISSUE:

Some installation configurations could result in an old version of Foundation being installed. See Apple Knowledge Base article 75198, "**WebObjects 4.5.1: Earlier Foundation Framework Installed In Certain Configurations**" for the details.

RESOLUTION:

The update for Windows Deployment installs the correct version of Foundation.dll. For other affected configurations, follow the instructions in the KBase article.

Corrected in WebObjects 4.5.1 Update 3

wotaskd sometimes returns content length 0

Apple Reference 2744196

ISSUE:

On Mac OS X 10.1 wotaskd sometimes returns empty content for all requests, depending on how it is started.

RESOLUTION:

This problem has been corrected.

ObjC apps raise when running on Mac OS X 10.1

Apple Reference 2757892

ISSUE:

In Mac OS X 10.0.x, immutable collections in Foundation were implemented as mutable collections. In Mac OS X 10.1, the collection implementations were changed so that immutable collections were actually immutable. This change was incompatible with WebObjects 4.5.1.

RESOLUTION:

WebObjects.framework now uses a compatibility mode in Foundation in which all collections are mutable.

WebObjects Builder broken after upgrading to Mac OS X 10.1

Apple Reference 2782527

ISSUE:

The upgrade installer for Mac OS X 10.1 removes HTMLEditing.framework from the system. Since WebObjects Builder depends on this framework, it will no longer run. Upon launching WebObjects Builder, you will see the following error message:

dyld: /Developer/Applications/WebObjects Builder.app/Contents/MacOS/WebObjects Builder can't open library:
/System/Library/PrivateFrameworks/HTMLEditing.framework/Versions/A/HTMLEditing
(No such file or directory, errno = 2)

RESOLUTION:

The update installs the version of HTMLEditing.framework shipped with WebObjects 4.5.1.

"Save as" does not change the name in the title bar for a model

Apple Reference 2796022

ISSUE:

After performing a "Save as" operation, EOModeler does not change the name of the model in the window title bar.

RESOLUTION:

The window title bar now properly reflects the new name of the model.

WOSendMail calls obsolete methods on NSUserDefaults

Apple Reference 2798848

ISSUE:

WOSendMail calls several obsolete NSUserDefaults methods, which caused warning messages to be printed.

RESOLUTION:

WOSendMail no longer calls the obsolete methods.

wotaskd and Monitor run with unexpected defaults on Mac OS X 10.1

Apple Reference 2802265

ISSUE:

The user defaults system changed between Mac OS X 10.0.x and Mac OS X 10.1. This causes Monitor and wotaskd to run with an unexpected set of defaults.

RESOLUTION:

Monitor and wotaskd have been modified to work properly with the user defaults system on Mac OS X 10.1.

Corrected in WebObjects 4.5.1 Update 2

Wrong Swing method in IB code generation for NSTableView

Apple Reference 2453148

ISSUE:

Swing code generated by InterfaceBuilder improperly uses setWidth instead of setPreferredWidth for NSTableView.

RESOLUTION:

This has been corrected.

woservice has a small memory leak

Apple Reference 2491807

ISSUE:

woservice has a small memory leak each time it launches the application it watches.

RESOLUTION:

The leak has been removed.

WOSession leaks an ivar

Apple Reference 2503730

ISSUE:

WOSession leaked an ivar when deallocated.

RESOLUTION:

This has been corrected.

NSAttributeDictionary methods crash if +initialize hasn't completed

Apple Reference 2529298

ISSUE:

A multithreaded application can crash if NSAttributeDictionary methods are called before its +initialize method has finished executing.

RESOLUTION:

NSAttributeDictionary is now initialized early in the application's startup.

Snapshot ref counting problem when inserting into and deleting parent/child ECs

Apple Reference 2609375

ISSUE:

Certain sequences of operations involving nested editing contexts can cause problems with the snapshot reference count.

RESOLUTION:

Snapshot reference counts are now properly maintained. Correcting this problem required adding an instance variable to the EOEditingContext class, changing the size of an EOEditingContext instance. This breaks binary compatibility for customers that subclass EOEditingContext and add ivars. Customers who do this must recompile.

direct action URL generation missing instance numbers

Apple Reference 2616937

ISSUE:

Under certain circumstances WebObjects would not include an instance number when generating a URL for a direct action. This could cause the WebObjects adaptor to load balance to a different instance which does not contain the user's session.

RESOLUTION:

URL generation for direct actions has been modified to preserve the instance number when appropriate.

Monitor/wotaskd could not tell the difference between Mac OS X Server 1.2 and Mac OS X Server 10.0.x

Apple Reference 2657074

ISSUE:

Monitor/wotaskd used a compile time method to determine the OS reported in Monitor's Hosts page. A Mac OS X 10.0.x machine was reported as Mac OS X Server.

RESOLUTION:

Mac OS X (Server) 10.0.x now reports the information in /System/Library/CoreServices/SystemVersion.plist. Mac OS X Server 1.2 will report as "Mac OS X Server".

Server-side WebAssistant launch line incorrect

Apple Reference 2661845

ISSUE:

If your DirectToWeb application uses '-D2WWebAssistantEnabled YES' as a command line argument rather than programmatically setting it after the application has finished launching, the port number will not yet be set and the server-side WebAssistant launch line will print with the incorrect port number -1, as in the following example:

```
appletviewer http://localhost:-1/cgi-bin/WebObjects/Administrate.woa/wa/D2WActions/openWebAssistant
```

RESOLUTION:

Specify a real port number in the appletviewer launch command, or specify a port at launch using the -WOPort <#> command line argument.

Adding an object to an owns relationship always puts it in the "inserted" list

Apple Reference 2663566

ISSUE:

Adding an object which has already been saved to an owns relationship always puts it in the list of 'inserted' objects. This creates an inconsistency when saving changes.

RESOLUTION:

EOControl has been modified to check whether the object is already in the editing context before adding it to the inserted list.

Sessionless direct action development apps inaccessible via web server

Apple Reference 2663739

ISSUE:

An instance of a sessionless direct action application does not include the instance id in the URL generated by WOHyperlink. As a result, this type of application is not accessible through the WebObjects web server adaptor when running as a development instance.

RESOLUTION:

URL generation has been modified to include the instance number for development instances.

Adaptor XML parser can crash with bad syntax

Apple Reference 2664670

ISSUE:

Certain textual formatting errors in the XML configuration file for the WebObjects HTTP adaptor can cause the adaptor to crash. (Note that wotaskd produces correct XML, so this only applies if a file is being used to configure the adaptor.)

RESOLUTION:

The XML parser has been modified to correctly handle the case that was causing the crash.

CreatePlots and LongRequest examples fail to clean or build on MOSXS 1.2

Apple Reference 2667045

ISSUE:

These two examples cannot be cleaned or built on Mac OS X Server 1.2 because the path to gnumake defined in PB.project is incorrect for this platform.

RESOLUTION:

The PB.project files for these two examples have been corrected.

NSUnarchive exception when running SetupWizard.app in the EOF Examples on MacOS X Server 1.2

Apple Reference 2673597

ISSUE:

The nibs in the EOF examples were corrupted in the shipping version of WebObjects 4.5.1.

RESOLUTION:

The update replaces the corrupted nibs with the correct files.

Time zone updates missing on Windows

Apple Reference 2678768

ISSUE:

Several files needed to resolve the issues originally resolved in WebObjects 4.0.1 Patch 2 and WebObjects 4.5 Update 3 (see Apple reference #2406610 in either update overview in the Knowledge Base for details) were omitted from WebObjects 4.5.1 on the Windows platform only.

RESOLUTION:

This update includes the missing files for Windows.

Update 4.5.1 adaptor to 5.0 GM version

Apple Reference 2691647

ISSUE:

Some changes were made to the WebObjects adaptor between the WebObjects 4.5.1 release and the WebObjects 5.0 release.

RESOLUTION:

This update includes all the source changes to the WebObjects adaptor up to the WebObjects 5.0 release. (This update also includes changes which were made after the WebObjects 5.0 release. These are documented separately.)

EOTextAssociation does not recognize Mac OS X rtf header "{\\\\rtf1" and throws an exception

Apple Reference 2695698

ISSUE:

New RTF data generated on Mac OS X 10.0.x uses the header "{\\\\rtf1" where previous WebObjects platforms used "{\\\\rtf0".

RESOLUTION:

EOTextAssociation has been updated to handle the new RTF signature properly.

WebObjects 4.5.1 adaptor source won't compile on MOSXS 1.2

Apple Reference 2696008

ISSUE:

The Mac OS X Server 1.2 installation includes sources for the WebObjects 4.0.1 adaptor. Installing the WebObjects 4.5.1 adaptor on a system with the 4.0.1 sources results in an incompatible mix of files from the two versions.

RESOLUTION:

This update removes any existing installed adaptor source on Mac OS X Server 1.2 and Mac OS X (Server) 10.0.x. The full WebObjects adaptor source is included in the update and installed on all platforms.

EOPalette raises when opening connection inspector

TA26815_WebObjects_WebObjects_Update_Overview.pdf

Apple Reference 2732969

ISSUE:

EOPalette sometimes raised an exception when the user selected the Connections inspector. This prevented the developer from changing or creating connections in existing nib files.

RESOLUTION:

This has been corrected.

Corrected in WebObjects 4.5.1 Update 1

WebObjects 4.5.1 Update 1 was applicable only to Mac OS X 10.0.x systems with WebObjects 4.5.1 Developer installed. It did the following:

- created the file /System/Library/WebObjects/Configuration/WebServerConfig.plist, which is needed to do a "split install" of your WebObjects application from ProjectBuilderWO on a developer system.
- updated precompiled headers.
- created the missing documentation links mentioned in the Readme.rtf on the CD.

Published Date: Oct 10, 2016

WebObjects 4.5.1: Earlier Foundation Framework Installed In Certain Configurations

Certain WebObjects 4.5.1 installation configurations contain an incorrect version of the Foundation framework. The incorrect version is the version that originally came with WebObjects 4.5. Several important issues in the Foundation framework were fixed in the WebObjects 4.5.1 release. The correct Foundation version is expected to be included in a future WebObjects 4.5.1 update for affected configurations. Affected customers can work around this issue until the updates are available by installing the correct version of Foundation as described below.

Note: WebObjects 4.5.1 Update 4 has been released. Update 4 installs the correct version of Foundation on Windows deployment. If you install Update 4 on your Windows computer you will not be affected by this issue. Refer to article 70037: "**WebObjects Current Patch List**", for information on the most current updates for WebObjects.

The installation configurations which are affected by this issue are:

- WebObjects Deployment on Windows
- A minimal WebObjects installation on Solaris

This issue does not occur in the other supported installation configurations for WebObjects 4.5.1:

- Mac OS X (Server) 10.0.3 or later
- Mac OS X Server 1.2
- WebObjects Developer on Windows
- A full WebObjects install on Solaris.

This article has been archived and is no longer updated by Apple.
There were several issues fixed in Foundation between WebObjects 4.5 and WebObjects 4.5.1. You can find them documented in the release notes
for **WebObjects 4.5 Update 3** (which includes all fixes in Updates 1 and 2) and **WebObjects 4.5.1**. The most serious and time-critical is described in the following release note and was originally fixed in WebObjects 4.5 Update 2:

> Adding days hangs at 1/1/2002
>
> Apple reference #2437169
>
> ISSUE:
>
> The NSCalendarDate method -dateByAddingYears:months:days:hours:minutes:seconds: could get stuck in an infinite loop for some values of the calculated resulting date.
>
> RESOLUTION:
>
> NSCalendarDate now correctly calculates the resulting date.

To avoid this issue on Solaris, simply do a full WebObjects installation and not a minimal installation. If you have an existing deployment system on which you did a minimal installation, you can correct the problem by extracting `Library/Frameworks/Foundation.framework/Versions/C/libFoundation.so.C` from the `wodev.TAR.Z` package inside the `Solaris/WebObjects` directory on your WebObjects 4.5.1 Deployment CD. You can also reinstall WebObjects 4.5.1 performing a full installation.

To make it easier to tell the right version from the wrong version, here are the pertinent details for each:

Incorrect Version: WebObjects 4.5 libFoundation.so.C: size = 2972836, date = Jan 24 2000

Correct Version: WebObjects 4.5.1 libFoundation.so.C: size = 2973980, date = Feb 22 2001

On Windows, an existing deployment system can be corrected by copying the `C:/Apple/Library/Executables/Foundation.dll` from a WebObjects 4.5.1 Developer system to your deployment system. Alternatively, you can install WebObjects 4.5.1 Developer on your deployment system. To make
it easier to tell the right version from the wrong version, here are the pertinent details for each:

Incorrect Version: WebObjects 4.5 Foundation.dll: size = 1818339, date = Jan 24 2000

TA26817_WebObjects_Earlier_Foundation_Framework_Installed_In_Certain_Configurations.p

Correct Version: WebObjects 4.5.1 Foundation.dll: size = 1818974, date = Feb 22 2001

This issue is expected to be corrected in a future update to WebObjects 4.5.1 Deployment. Once that update has been released, installing it will be the best way to correct this issue.

Published Date: Feb 19, 2012

WebObjects 5.1.2: Update Overview

This document contains an overview and download information for Apple's WebObjects 5.1.2 update. Apple recommends that all users of WebObjects 5.1 install this update on all platforms.

The **WebObjects Current Patch List**, document 70037, contains information on all available patches and updates for all versions of WebObjects. Read this document if you're not sure which update you need on your system.

This article has been archived and is no longer updated by Apple.
WebObjects 5.1.2 includes updated versions of several WebObjects class and jar files. Some WebObjects project types make copies of these files when the project is built. As a result, some projects may need to be rebuilt to take advantage of the issues addressed in the update. For example, when a JSP/Servlet war archive is created, several jars are copied into the war file. At least one jar (WOJSPServlet_client.jar, from the WOJSPServlet.framework) is always copied, and additional framework jars may be copied into the war as well, depending on the project. After installing WebObjects 5.1.2, either the application must be rebuilt (recreating the war archive), or the war archive must be manually updated, using the jar tool.

This update includes modified WebObjects client-side Java classes and jars. On Mac OS X Server and Microsoft Windows the update installer automatically places the modified classes and jars in your web server's document root directory. On Sun Solaris, the update installer places the modified classes in the WebObjects installation (in `$NEXT_ROOT/Library/WebObjects/WODocumentRoot/WebObjects`) but does not copy them to your web server's document root directory. To use the new files, you must install them in the correct location for the web server being used.

WebObjects 5.1.2 for Mac OS X (Server) 10.1.4

Important: There are two mutually exclusive updates for this platform. If you have WebObjects 5.1 Developer installed on Mac OS X 10.1.4, you need the WebObjects 5.1.2 Developer update. If you have WebObjects 5.1 Deployment installed on Mac OS X Server 10.1.4, you need the WebObjects 5.1.2 Deployment update. You do not need both on any system.

This update is available through the Software Update feature of Mac OS X. If you use this method, only the proper update for the software which you have installed on your system is visible and available for download. If you prefer to download and install the package manually, follow the instructions below.

Note: WebObjects 5.1.2 Deployment requires:

- Mac OS X Server 10.1.4 or later
- Mac OS X 10.1.4 Server Update
- April 2002 Security Update
- Java 1.3.1 Update 1

WebObjects 5.1.2 Developer requires:

- Mac OS X 10.1.4 or later
- December 2001 Mac OS X 10.1 Developer Tools
- April 2002 Security Update,
- Java 1.3.1 Update 1

If you have not yet updated to the correct version of Mac OS X Server, Developer Tools, and Java, you **must** do so before installing WebObjects 5.1.2. The Mac OS X 10.1.4 and December 2001 Mac OS X 10.1 Developer Tools images are available on the Apple web site.

If you are creating a new Mac OS X WebObjects 5.1 development system, you should install the software in the following order:

1. Mac OS X 10.1.4
2. December 2001 Mac OS X 10.1 Developer Tools
3. Java 1.3.1 Update 1
4. April 2002 Security Update
5. WebObjects 5.1 Developer
6. WebObjects 5.1.2 Developer

Manually Installing WebObjects 5.1.2 Developer on Mac OS X 10.1.4

These instructions are for manually downloading and installing WebObjects 5.1.2 Developer. If you are installing using Software Update, see **WebObjects 5.1.2 for Mac OS X Server 10.1.4**, above.

Note: WebObjects 5.1.2 Developer requires:

- Mac OS X 10.1.4 or later
- December 2001 Mac OS X 10.1 Developer Tools
- April 2002 Security Update,
- Java 1.3.1 Update 1

If you have not yet updated to the correct version of Mac OS X, Developer Tools, and Java, you **must** do so before installing WebObjects 5.1.2. The Mac OS X 10.1.4 and December 2001 Mac OS X 10.1 Developer Tools images are available on the Apple web site.

1. Download `WO51MacOSXDevUpdate2.pkg.tar`, the update package for Mac OS X 10.1.

The update is available from:

http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/5.1/WO51MacOSXDevUpdate2.pkg.tar

Stuffit Expander should automatically expand the .tar file, leaving `WO51MacOSXDevUpdate2.pkg`.

2. Double-click WO51MacOSXDevUpdate2.pkg.
The Authorization panel opens.

Only an administrator can install the update.

3. Click the lock icon at the bottom left of the panel to authenticate for administrative access, then click OK.

4. Click Continue in the Introduction panel.

5. Read the software license agreement then click Continue.

6. To agree to the license and continue the installation, click Agree.

7. Select the volume containing Mac OS X and WebObjects 5.1 Developer, then click Continue.

8. Make sure that there are no WebObjects or EOF applications running.

9. Click Install to proceed with installation.
The Installer window displays information about the progress of the installation, which may take several minutes.

10. Restart your computer.

Manually Installing WebObjects 5.1.2 Deployment on Mac OS X Server 10.1.4

These instructions are for manually downloading and installing WebObjects 5.1.2 Deployment. If you are installing using Software Update, see **WebObjects 5.1.2 for Mac OS X Server 10.1.4**, above.

Note: WebObjects 5.1.2 Deployment requires:

- Mac OS X Server 10.1.4 or later
- Mac OS X 10.1.4 Server Update
- Java 1.3.1 Update 1

If you have not yet updated to the correct version of Mac OS X Server and Java, you must do so before installing WebObjects 5.1.2. The Mac OS X Server 10.1.4 image is available on the Apple web site.

1. Download `WO51MacOSXDepUpdate2.pkg.tar`, the update package for Mac OS X Server 10.1.

The update is available from:

http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/5.1/WO51MacOSXDepUpdate2.pkg.tar

Stuffit Expander should automatically expand the .tar file, leaving `WO51MacOSXDepUpdate2.pkg`.

2. Double-click `WO51MacOSXDepUpdate2.pkg`.
The Authorization panel opens.

Only an administrator can install the update.

3. Click the lock icon at the bottom left of the panel to authenticate for administrative access, then click OK.

4. Click the Continue button in the Introduction panel.

5. Read the software license agreement and then click Continue.

6. To agree to the license and continue the installation, click Agree.

7. Select the volume that contains Mac OS X Server and WebObjects 5.1 Deployment and then click Continue.

8. Make sure that there are no WebObjects or EOF applications running.

9. Click Install to proceed with installation.
The Installer window displays information about the progress of the installation, which may take several minutes.

10. Restart your computer.

Installing WebObjects 5.1.2 on Windows 2000

Notes:

- During the installation, if you see panels indicating that certain files being replaced by the update are "locked", click Reboot to continue the installation. The files will then be replaced upon restarting.
- This update cannot be uninstalled alone. Once you have upgraded to WebObjects 5.1.2 you cannot revert to WebObjects 5.1. However, the entire WebObjects 5.1.2 installation can be uninstalled using the Add/Remove Programs control panel.
- The WebObjects 5.1.2 update includes updated reference documentation in the standard JavaDoc format for the changes to the NSTimeZone, NSTimestamp, and

NSTimestampFormatter classes. The files are placed in `$NEXT_ROOT\\Developer\\Documentation\\WebObjects\\Reference`.

1. Download `WO51WinUpdate2.exe`, the self-extracting update installer for Windows 2000.

The update is available from:

http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/5.1/WO51WinUpdate2.exe

2. Log in as a user with Administrator privileges.

3. Make sure that there are no WebObjects or EOF applications running.

4. Double-click on the update installer, `WO51WinUpdate2.exe`, to start the installation process.
A screen appears with some information about this update.

5. After you have read the information screen, click Next to continue.
The license agreement for this update appears.

6. To agree to the license and continue the installation, click Yes.
The update will be installed on your system and you will be asked if you want to restart.

7. Select Yes, I want to restart my computer now to restart Windows.
The WinZip self-extractor automatically quits and removes its temporary files in about 20 seconds.

Installing WebObjects 5.1.2 on Solaris

1. Download `WO51SolarisUpdate2.TAR.Z`, the update installer for Solaris.

You will also need to download the update installation script, `patcher.sh`.

The update is available from:

http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/5.1/WO51SolarisUpdate2.TAR.Z

The installation script is available at:

http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/scripts/patcher.sh

After you have downloaded the files, the patcher.sh script needs its executable bit set. At the command prompt enter:

```
chmod 511 patcher.sh
```

2. Log in as root.

3. Make sure that there are no WebObjects or EOF applications running, including Monitor.

4. If a web server is running on the computer on which you are installing the update, stop it.

5. Stop WebObjects services (`wotaskd` and `woservice`) using the WOServices script. At the command prompt enter:

```
cd $NEXT_ROOT/Library/WebObjects/Executables
./WOServices stop
```

These services will restart when you restart the computer after installing the update.

6. To Install the update, cd to the directory containing the update and the patcher.sh installation script. Then at the command prompt enter:

patcher.sh -install WO51SolarisUpdate2.TAR.Z

For more information on using patcher.sh, at the command prompt enter:

patcher.sh -help

7. Copy the updated WODocument root to your web server's document root.

cp -r $NEXT_ROOT/Library/WebObjects/WODocumentRoot/WebObjects <webserver doc root>/WebObjects

8. restart your computer.

Corrected in WebObjects 5.1.2

NPE with a compound primary key whose value types are other than 'i'

Apple Reference 2838002

ISSUE:

In some circumstances, using a compound primary key with a value type other than 'i' would result in EOF replacing one component of the key with null.

RESOLUTION:

This issue has been corrected.

WOResourceManager generating incorrect URLs when WOApp accessed via web server

Apple Reference 2838073

ISSUE:

WOResourceManager generates incorrect URLs when an app started in ProjectBuilder is accessed via a web server. This can cause images to fail to load.

RESOLUTION:

This issue has been corrected. It only occurs if the app detects that its project is currently open in ProjectBuilder when the instance is launched. This issue does not affect deployed apps.

EOModeler fails to launch FileMerge when merging .java files (Windows)

Apple Reference 2851049

ISSUE:

EOModeler fails to merge .java files in FileMerge because FileMerge does not launch. Also, FileMerge fails to show differences when the path to the eomodel has a directory with a space in its name. This issue is specific to the Windows platform.

RESOLUTION:

This issue has been corrected.

EOModeler fails to overwrite existing .java file (Windows)

Apple Reference 2851267

ISSUE:

EOModeler fails to overwrite previously generated files when generating java files for an entity. This issue is specific to the Windows platform.

RESOLUTION:

This issue has been corrected. In addition, EOModeler now includes an option to merge any differences using FileMerge.

In-memory qualification returns too many objects

Apple Reference 2852347

ISSUE:

Qualification of in-memory objects returns objects with null values in addition to the desired objects.

RESOLUTION:

For EOQualifier on in-memory objects, the operators <, >, <=, and >= always return false if either operand is null. However, = and != treat null values as equal to null and return the appropriate result. EOSortingOrder treats null as negative infinity.

NPE in EOClassDescription when propagating deletes

Apple Reference 2856718

ISSUE:

If a to-many relationship was set to null, EOClassDescription throws a null pointer exception when propagating deletes through the to-many relationship.

RESOLUTION:

This issue has been corrected.

The command "opendiff" does not launch FileMerge (Windows)

Apple Reference 2869320

ISSUE:

On Windows the "opendiff" command will not launch FileMerge.

RESOLUTION:

This issue has been corrected.

"unable to increment snapshot count for object" exception in fetch

Apple Reference 2869648

ISSUE:

`EOEditingContext.objectsWithFetchSpecification()` fails sometimes with an exception similar to: java.lang.IllegalStateException: incrementSnapshotCountForGlobalID: com.webobjects.eoaccess.EODatabase - unable to increment snapshot count for object with global ID xxx - no snapshot exists.

RESOLUTION:

WebObjects 5.1.2 corrects one possible way this exception can occur. However, the issue remains under investigation.

NSTimeZone.setDefault() should accept java.util.TimeZone

Apple Reference 2881499

ISSUE:

NSTimeZone.setDefault() throws an IllegalArgumentException when passed a java.util.TimeZone.

RESOLUTION:

NSTimeZone.setDefault() has been modified to accept a java.util.TimeZone.

NSTimeZones hash to zero

Apple Reference 2894077

ISSUE:

All NSTimeZones hash to zero.

RESOLUTION:

This issue has been corrected.

NSTimestamp() creates an incorrect timestamp

Apple Reference 2894102

ISSUE:

If an NSTimestamp is created using NSTimestamp(int year, int month, int date, int hour, int minute, int second, TimeZone tz) with values which refer to a time before the reference date, the created NSTimestamp is off by one second.

RESOLUTION:

This issue has been corrected.

NSTimeZone.getGMT() should be public

Apple Reference 2894146

ISSUE:

NSTimeZone.getGMT() should be public.

RESOLUTION:

NSTimeZone.getGMT() is now public and returns an NSTimeZone corresponding to Etc/GMT (GMT) offset 0.

NSTimestamp throws when using custom Java time zone

Apple Reference 2894493

ISSUE:

NSTimestamp throws an exception when using a custom Java time zone like GMT+06:00.

RESOLUTION:

NSTimeZone now supports time zones of the form GMT[+|-]hh:mm. They can be generated using NSTimeZone.timeZoneForSecondsFromGMT(int secondsOffsetFromGMT).

NSTimestamp(System.currentTimeMillis(), 999999999) throws an exception

Apple Reference 2894495

ISSUE:

NSTimestamp(System.currentTimeMillis(), 999999999) throws an exception. This method should only throw an exception when the nanos argument is greater than 999999999.

RESOLUTION:

This issue has been corrected.

NSTImeZone.setDefault() to NSLocalTimeZone should throw

Apple Reference 2894496

ISSUE:

It should be invalid to set the default time zone to NSLocalTimeZone.

RESOLUTION:

NSTimeZone.setDefault() now throws an IllegalArgumentException when passed an NSLocalTimeZone.

NPE if you call hashCode() on an NSLocalTimeZone object

Apple Reference 2894498

ISSUE:

Calling hashCode() on an NSLocalTimeZone object results in a null pointer exception.

RESOLUTION:

NSLocalTimeZone.hashCode() now returns the hash code of defaultTimeZone().

NSTimestampFormatter.parseObject() cannot parse arbitrary GMT timezone strings

Apple Reference 2894500

ISSUE:

NSTimestampFormatter.parseObject() cannot parse arbitrary GMT timezone strings like "GMT+12:15".

RESOLUTION:

This issue has been corrected.

Some abbreviations don't have corresponding time zone.

Apple Reference 2894502

ISSUE:

Some abbreviations don't have a corresponding NSTimeZone.

RESOLUTION:

This issue has been corrected.

timeZoneForSecondsFromGMT doesn't deal with extra seconds

Apple Reference 2894503

ISSUE:

Any extra seconds that were not part of whole hours and minutes were included in the offset of the apolitical time zone created.

RESOLUTION:

Extra seconds are now rounded to the nearest minute. For example:

NSTimeZone.timeZoneForSecondsFromGMT(-30) = GMT-00:01 () offset -60
NSTimeZone.timeZoneForSecondsFromGMT(-29) = GMT-00:00 () offset 0
NSTimeZone.timeZoneForSecondsFromGMT(30) = GMT+00:01 () offset 60
NSTimeZone.timeZoneForSecondsFromGMT(29) = GMT+00:00 () offset 0

NSTimestampFormatter.parseObjectInUTC can fail

Apple Reference 2894504

ISSUE:

NSTimestampFormatter.parseObjectInUTC() fails when the parse position is not at the beginning of the string.

RESOLUTION:

This issue has been corrected.

Apolitical time zones always return a zero offset from GMT

Apple Reference 2894505

ISSUE:

NSTimeZone.getRawOffset() is returning zero for apolitical time zones like "Etc/GMT+9".

RESOLUTION:

Apolitical time zones now return their offset from GMT. Geopolitical time zones will return zero, as many do not have one generic offset.

NSTimeZone.getAvailableIDs() contains "Factory"

Apple Reference 2894507

ISSUE:

NSTimeZone.getAvailableIDs() returns an incorrect entry "Factory".

RESOLUTION:

This issue has been corrected.

Corrected in WebObjects 5.1.1

NSTimeZone : timeZoneFromSecondsFromGMT() returns no time zone even when value is valid

Apple Reference 2814979

ISSUE:

NSTimeZone.timeZoneFromSecondsFromGMT() returned null when the offset was a valid value for an apolitical time zone.

RESOLUTION:

If the seconds offset from GMT corresponds to a whole hour between 12 and -12 inclusive, this method reuses an existing, well-known, apolitical NSTimeZone object for that offset. Only whole hour offsets should by passed to this method in WebObjects 5.1.1.

NSPathUtilities.stringByDeletingLastPathComponent() returns incorrect result on Windows

Apple Reference 2822553

ISSUE:

On Windows, NSPathUtilities.stringByDeletingLastPathComponent() returns an incorrect result if the root directory is specified. For example, an input of "C:/" incorrectly returns "C:" rather than "C:/".

RESOLUTION:

This problem has been corrected.

NSTimestamp.microsecondOfSecond is off by a factor of 1000

Apple Reference 2837997

ISSUE:

In WebObjects 5.1, NSTimestamp.microsecondOfSecond() actually returns milliseconds.

RESOLUTION:

This problem has been corrected.

NSTimestampFormatter does not format NSTimestamp in the local time zone

Apple Reference 2838080

ISSUE:

In WebObjects 5.1, NSTimestampFormatter does not format NSTimestamp in the local time zone.

RESOLUTION:

NSTImestampFormatter now defaults to the local time zone.

WOEventDisplay gives an error screen when logging is on

Apple Reference 2844727

ISSUE:

Viewing the event display page can result in a ClassCastException.

RESOLUTION:

This problem has been corrected.

NSTimestamp does not have SUID for serialization

Apple Reference 2847504

ISSUE:

WebObjects 5.1 cannot read NSTimestamps serialized in WebObjects 5.0.

RESOLUTION:

The serialID in WebObjects 5.1.1 has been changed to match the serialID in WebObjects 5.0. In WebObjects 5.1.1, NSTimestamp will read WebObjects 5.0/5.1.1 serialized Timestamps and write WebObjects 5.1.1 NSTimestamps.

NSTimestamp data that was serialized using WebObjects 5.1 cannot be deserialized using WebObjects 5.1.1. However, data can be migrated using NSTimestampFormatter. A WebObjects 5.1 tool can use NSTimestampFormatter to convert NSTimestamps to Strings. Then a WebObjects 5.1.1 tool can use NSTimestampFormatter to convert the Strings back to NSTimestamps.

NSTimestampFormatter.parseObject creates incorrect timestamp

Apple Reference 2849628

ISSUE:

NSTimestampFormatter.parseObject creates an incorrect timestamp when the string being parsed does not use GMT for the time zone.

RESOLUTION:

This problem has been corrected. Please review any subclasses of NSTimestampFormatter you may have used to work around this problem in your WebObjects 5.1 applications.

NSTimeZone.localTimeZone() raises

Apple Reference 2849630

ISSUE:

Using NSTimeZone.localTimeZone() with NSTimestampFormatter raises an exception.

RESOLUTION:

This problem has been corrected.

backtracking page cache not working properly

Apple Reference 2849640

ISSUE:

Backtracking in a browser and repeating a request or reloading a previously generated page incorrectly causes the request/response loop to execute rather than simply returning the cached page. (See WOApplication.setPageRefreshOnBacktrackEnabled().)

RESOLUTION:

The page cache now functions properly. Additionally, a request's form values (if any) are now considered when determining whether to return a cached page. If the user backtracks and repeats a request with modified form values, the request/response loop will execute. However, with the current implementation, the responses for both sets of form values remain in the cache. If the user backtracks a second time and makes another request with the original form values, the request/response loop will not execute and the cached page will be returned.

The documentation for WOApplication.setPageRefreshOnBacktrackEnabled() is incorrect on one point. The documentation states "By default, this attribute is set to false." The default in WebObjects 5.1 is true.

WO5.1 Win2K Cannot Launch Apps

Apple Reference 2849676

ISSUE:

Launching WebObjects 5.1 applications on Windows 2000 with European localization can fail with an error similar to:

```
Configuring launch environment for HelloWorld...

443 was unexpected at this time.
```

RESOLUTION:

This is a problem in the application launcher .cmd file generated when the application is built. The WebObjects build tools have been modified to produce correct .cmd files. However, existing .cmd files must be regenerated to incorporate this change. If you are experiencing this problem you must rebuild your application after installing WebObjects 5.1.1.

NullPointerException in WO5.1 with many to many relationships

Apple Reference 2850322

ISSUE:

In WebObjects 5.1, if an EOModel defines a many to many relationship that is only modeled in one direction, an error occurs attempting to access the entity which does not have the relationship modeled.

RESOLUTION:

This problem has been corrected.

An optimistic locking failure can cause subsequent fetch failures

Apple Reference 2852342

ISSUE:

An exception can leave the JDBCChannel in a bad state. Thereafter, a SELECT query can be incorrectly sent via a JDBC executeUpdate() call, raising a JDBCAdaptorException.

RESOLUTION:

This problem has been corrected.

Opening Components in WOBuilder

Apple Reference 2863520

ISSUE:

WOBuilder sometimes fails to open a component when double clicking on a .wo in ProjectBuilder. WOBuilder displays the message "Failed to open component".

RESOLUTION:

This problem has been corrected.

EOModeler fails to overwrite existing *.java file

Apple Reference 2880006

ISSUE:

When generating java files for an entity, EOModeler fails to overwrite previously generated files.

RESOLUTION:

This has been fixed for WebObjects on Mac OS X. In addition, EOModeler now includes an option to merge any differences using FileMerge.

Published Date: Feb 19, 2012

AppleScript 1.7 for Mac OS X 10.1: Release Notes

This document contains the AppleScript 1.7 for Mac OS X 10.1 Release Notes.
This article has been archived and is no longer updated by Apple.

AppleScript 1.7 for Mac OS X 10.1 - Release Notes

FEATURES:

Program Linking. AppleScript Language Mac OS X version 10.0 through 10.0.4 did not support Program Linking. With Mac OS X version 10.1 and later, and AppleScript version 1.7 and later, Program Linking works between Mac OS X machines as well as between Mac OS 9 and Mac OS X machines.

When targeting applications running on a Mac OS X machine, you must use TCP/IP networking and addressing; AppleTalk is not supported. (In addition, AppleScript 1.7 now supports encoding the login name and password into the "eppc" URL.) For a Mac OS X machine to respond to Program Linking requests, "Allow Remote Apple Events" must be enabled in the Sharing panel of System Preferences.

SOAP and XML-RPC Support. AppleScript 1.7 for Mac OS X 10.1 can use Internet applications as targets of Tell blocks. The syntax is:

```
tell application "http://server.domain.com/application"
    call xmlrpc {methodName:"XMLRPCMethod", parameters: {"hello", 25}}
    -- or
    call soap {methodName:"SOAPMethod", ¬
        method namespace uri: "urn:xmethodsTest", ¬
        parameters: {{name:"Fred", age:32}}, ¬
        SOAPAction:"urn:xmethodsTest#Test"}
end tell
```

The URL for the application reference must be a correct URL for a SOAP (Simple Object Access Protocol) or XML-RPC (eXtended Markup Language Remote Procedure Call) Web server.

An alternate syntax is: `tell application "webapplication" of machine "http://server.domain.com"`

but this form will be converted to the form above when the script is compiled.

New Icons. AppleScript 1.7 includes new icons for script files, scripting additions, and applets and droplets in Mac OS X. You should note that the new icons for compiled and uncompiled script files are more similar in X than they were in 9; you can tell the difference by the word "TEXT" in the icon for uncompiled text. Note also that while scripting additions and script files will appear with new icons automatically after a 10.1 upgrade, applets and droplets will not get the new icons until they are opened in Script Editor 1.7 and re-saved.

File Extensions. Like most other Mac OS X functions, AppleScript now supports file extensions (as well as the historical file types) on all the file kinds it deals with. The file types for AppleScript are:

script text	.applescript
compiled script	.scpt
scripting addition	.osax
scripting dictionary	.asdictionary

Line Endings. Because many Mac OS X files use "UNIX-style" line endings (using the linefeed character, or ASCII character 10), AppleScript versions 1.7 and later explicitly support embedding the linefeed character in strings with \\n. Scripts that use this feature can be run on older versions of AppleScript, but if decompiled, the linefeed character will not be visible in the decompiled output (but will recompile correctly).

Applets. Prior to AppleScript 1.4.3, script applications (applets) were stored in a "universal" format that worked on both 680x0-based and Power PC-based Macintosh models. Because that format was 680x0-based, it would not work on Mac OS X, so a "Mac OS X applet" format was introduced in AppleScript 1.4.3. With improvements in Mac OS X since that time, it is now possible to produce a script application that works on 680x0-based, Power PC-based Mac OS 9, and Mac OS X configurations. Script Editor 1.7 again offers only one choice for saving script applications. Older formats continue to work on the configurations they were saved for.

Command-Line Tools. The osacompile and osascript tools now have an "include" option ('-i') that allows you to specify application terminology to be used when compiling the given scripts. This frees you from having to specify applications in Tell blocks in the script itself. You can also use this to specify the static terminology for an application with dynamic terms, so you can prevent that application from being launched when you compile the script.

TA26819_AppleScript_for_Mac_OS_X_Release_Notes.pdf

BUG FIXES:

AppleScript Language In AppleScript 1.5 through 1.6, a script's global variables could be lost under certain rare circumstances. If a script contains a Tell block that targets a variable, and that variable specifies an application that does not exist, the "Where is application <name>?" dialog would be presented when the script is executed. After that point, further references to global variables in the handler that included the Tell block would fail. This has been fixed in AppleScript 1.7 for Mac OS X and Classic.

In AppleScript 1.5 and 1.6 for Mac OS X, scripting additions behaved fundamentally differently than in Mac OS 9: they were only installed in certain applications that were AppleScript-aware. If a scripting addition command (such as 'display dialog') was sent to an application that was not AppleScript-aware, the event would instead be executed in the application running the script (e.g. Script Editor); that means the dialog would come up in the Script Editor layer, not the Tell target application. In AppleScript 1.7 in Mac OS 10.1, the scripting additions mechanism has been redesigned to behave more like Mac OS 9, and scripting addition commands sent to applications will be executed in the process space and window layer of the target application.

AppleScript 1.5 through 1.6 often launched applications unnecessarily in order to get their terminology, and often used the terminology of the script editing application (such as Script Debugger) instead of application terminology. This has been fixed in AppleScript 1.7.

In AppleScript 1.5 through 1.6 for Mac OS X, the version property of AppleScript or an application would be displayed as raw data rather than a string (unless the version property was explicitly converted to a string). This has been fixed in AppleScript 1.7.

In AppleScript 1.5 and 1.6 for Mac OS X, certain operations with 'file' object specifiers (e.g. "'file Mac OS X:Applications:Terminal.app:" as alias) would fail, when similar operations would succeed on AppleScript 1.3 through 1.6 for Mac OS 9. These operations now work in AppleScript 1.7 for Mac OS X. Note that, as always, while you can pass a 'file' object specifier as a parameter to an event, or perform certain operations on it (like assignment and coercion), simply evaluating "'file pathname"' is itself an AppleScript error.

AppleScript 1.5 and 1.6 for Mac OS X could not target Mac OS 9 control panels running in the Classic environment. This has been fixed in AppleScript 1.7. Note that the Classic environment only supports a small number of control panels from Mac OS 9 (such as the Launcher).

Accessing paragraphs of AppleScript strings did not work correctly in AppleScript 1.5 through 1.6 if the line endings were Windows-style (CRLF). The result would be only the first half of the text paragraphs, interspersed with an equal number of blank strings. This has been fixed in AppleScript 1.7 and later.

Occasionally with AppleScript 1.5 and 1.6, recompiling a script would get an End of File error reading an application's terminology. This has been fixed in AppleScript 1.7.

In AppleScript 1.6, under certain circumstances calling a handler in an applet that has not been launched could cause an "Cannot continue" error. This has been fixed in AppleScript 1.7 and later.

In AppleScript 1.6, Unicode text values stored in script properties of a saved script could not be reloaded reliably. This has been fixed in AppleScript 1.7.

In AppleScript 1.6, Unicode text received from certain applications that included a Unicode byte-order mark would behave incorrectly; the text would appear to begin with the Euro symbol, and some operations would fail. AppleScript 1.7 handles Unicode text with byte-order marks correctly.

In somewhat rare circumstances, comparing two references to the same file for equality can fail even if both references refer to the same file. This is true in AppleScript 1.0 through 1.6 and has been fixed in AppleScript 1.7.

Due to a problem in AppleScript's script parser, the language formations "isn't", "doesn't", and possessives ending with "'s" would all accept a vertical bar or a double-quote character in place of the "s" or "t" following the apostrophe. In AppleScript 1.7 and later, these constructions (for example, "doesn'|" or "AppleScript"' version") are correctly noted as syntax errors.

Script Applications ("applets") In AppleScript 1.5 and 1.6, a running AppleScript applet will become non-responsive to any events (except command-period) after processing more than one incoming event. This has been fixed in AppleScript 1.7.

Script Editor In Script Editor 1.6 for Mac OS X 10.0.0 through 10.0.4, you could not choose the Finder with the "Browse" option from the "Open Dictionary..." dialog box. This has been fixed by Standard Additions 1.7 on Mac OS 10.1.

In Script Editor 1.6 in Mac OS X, attempting to paste Unicode text into the script window would result in an error. This has been fixed in Script Editor 1.7.

In Script Editor 1.6, printing a script to the printer would result in random characters being printed in the place of the script file name. This has been fixed in Script Editor 1.7.

Under certain circumstances in Mac OS 10.0.0 through 10.0.4, double-clicking generic TEXT files in the Finder would cause them to be opened by the Script Editor. This has been fixed in Script Editor 1.7, which will now be chosen to open only AppleScript-generated script text files. Script Editor 1.7 can also open files with the file extension ".applescript" even if they have no file type.

Standard Additions All disks formatted as Enhanced Macintosh File System ("HFS Plus") are able to store files with file names greater than 32 characters and stored as Unicode text. When older software accesses such files, those names are represented in an encoded form (with something like "#28AF" in the name). With AppleScript 1.6 and earlier, the results of many Standard Additions commands (like 'path to', 'info for', and 'list folder'), as well as creation and display of alias objects, would require and return encoded names. In AppleScript 1.7, long and Unicode file names in aliases and for scripting additions are represented by styled or Unicode text. Encoded file names are no longer supported.

From AppleScript 1.1, the 'offset' scripting addition command has not worked correctly when the direct parameter is styled text. It also has not worked correctly with the newly-introduced Unicode text type. In Standard Additions 1.7 and later it produces correct results with both styled and Unicode text.

In versions of Standard Additions prior to 1.7, the 'choose URL' command's 'using editable URL' parameter was present in the Scripting Additions dictionary but was nonfunctional (URLs were always editable regardless of the setting of the parameter). It behaves correctly in Standard Additions 1.7 and later: if set to false, the user can choose a URL only by browsing, not by editing the URL in the text box.

The 'choose from list' command in Scripting Additions 1.4 through 1.6 allowed the scripter to create a situation where it would return an empty selection even if the scripter specifically disallowed that case. (This can be done by supplying a default item that does not appear in the list). In Scripting Additions 1.7 and later, the "OK" button will not be enabled in such cases.

In Mac OS X, the 'info for' scripting addition in Standard Additions 1.7 now returns additional record items that provide information about the file's extensions. The 'displayed name' item returns the name of the item as the user sees it in the Finder or file dialogs, and the 'name extension' item now returns the file extension (if any) that is on the indicated file (without the ".", which is considered a separator, and not part of either the name or the extension). Both of these fields (along with the 'name' field itself) are Unicode text values.

In Standard Additions 1.6 and earlier, the 'info for' scripting addition would fail if any piece of information in the requested file or directory was unavailable. On UFS (Mac OS X) disks and mounted NFS volumes, the file creation date is unavailable, and accessing it causes a -8850 error (in trying to convert it to Universal Time). Starting with Standard Additions 1.7, any missing piece of information in the 'info for' result is provided as the value 'missing value' without failure. In AppleScript 1.6 and earlier, magnitude comparisons (<, ≤, >, ≥) against the 'missing value' would signal a coercion error for most types; i n 1.7 and later, these comparisons always return 'false' without error. These two changes ensure that scripts that use 'info for' against UFS and NFS volumes do not fail, though they may not get correct results because any comparison to the creation date is always false.

In Standard Additions 1.6 on both Mac OS 9 and Mac OS X, the 'info for' scripting addition would return an error -1401 for a nonexistent file, rather than the normal -35 returned in previous versions. In Standard Additions 1.7 trying to get the info for a nonexistent file (or a file in a nonexistent directory or inaccessible disk) will return the -35 error.

The 'read' command in Scripting Additions 1.6 had specific problems with the "using delimiters" parameter: in previous versions, 'read f as list using delimiters {tab}' would return a list, but in AppleScript 1.6, it returns a list of one-item lists. In AppleScript 1.7 and later it behaves as it did prior to version 1.6

The 'read' command in Scripting Additions 1.6 had specific problems with the 'before' and 'until' parameters if used in conjunction with the 'as' parameter. Instead of returning a value of a given type, it would return random data or an error. This has been fixed in Scripting Additions 1.7 and later.

Mac OS 9.1 introduced the concept of a "package", that is, a file composed of a folder of several files and folders, which is treated as an integral file by the Finder and other applications. The 'info for' scripting addition in AppleScript 1.6 and earlier treated such packaged data application files as folders, not files, and would not return file- or application-related information about them. In Standard Additions 1.7 and later, getting the information for any directory (including package folders) returns an additional record item "package folder" (if this Boolean value is true, then the directory is a package), and the file's type and creator.

Standard Additions 1.5 through 1.6 changed the way that the random number seed worked in the 'random number' scripting addition. Older versions used the system clock as the seed value if no seed value (or a seed value of 0) was provided; Scripting Additions 1.5 and 1.6 always use a seed value of 0 in these cases. In Scripting Additions 1.7 the older behavior has been restored. In addition, the seed value is now taken from the 60Hz 'ticks' counter rather than the system clock, because the increased speed of new machines makes it more likely that two consecutive random number calls may receive the same system clock time as their seed value.

In Mac OS X 10.0 through 10.0.4, the 'choose file name' scripting addition in Standard Additions 1.6 would crash if given an empty string ("") as the default file name. This has been fixed in Standard Additions 1.7. In addition, on Mac OS X the default file name can be a Unicode string.

Command-Line Tools For the osacompile and osascript command-line tools, the requirement that they be invoked with full paths (i.e. /usr/bin/osacompile) has been eliminated. They can now be invoked with implicit paths like any other command-line tool.

In Mac OS X 10.0.0 through 10.0.4, the '-l' and '-d' options for the osalang tool did not work as documented. In Mac OS X 10.1 and later, -l prints the subtype, manufacturer, flags, and name; and -L also prints the description in parentheses after the name.

The osacompile and osascript tools previously had a limit of 32K of input text. This limit has been lifted in Mac OS 10.1.

The osacompile and osascript tools execute as background applications; they cannot involve any user interface. If you want to call 'display dialog', 'choose from list', or other user-interface scripting additions from a script being executed by osascript, you must enclose it in a Tell block targeting a running application (such as the Finder).

KNOWN PROBLEMS:

AppleScript In AppleScript 1.0 and later, when you save a script using the 'store script' command it saves the script's entire parentage chain (which includes the script that calls the 'store script' command). This results in a stored script size that is much larger than would be expected. This is necessary in order for the script to have access to its parent's properties, globals, and handlers.

AppleScript 1.1 and later has a 32,767-character limit on string literals at compile time. If you need to compile scripts that contain string literals longer than 32K, use concatenation.

In AppleScript 1.1 and later, comparing two strings for equality will fail if one string contains more than 32,767 characters, even if the strings are obviously different.

In AppleScript 1.2 and later, certain mathematical operations on a small percentage of real numbers will return unexpected results. This is because many exact decimal fractions cannot be represented accurately in binary numbers. For example, (2.32 * 100) div 1 will compute to 231 rather than 232.

AppleScript supports recursive lists and records, that is, lists or records that include themselves. These are of limited utility. While they are handled correctly inside AppleScript itself, they cannot be sent to other applications or scripting additions, or a Stack Overflow error will result.

AppleScript compiles 4294967296 as 0, and numbers larger than that to their value minus 4294967296. The workaround is to use real-number format (e.g. 4294967296.0) instead.

If a script sends a Quit event to an application, the application will be launched if it is not running and be told to quit immediately. To prevent this, check the Processes class of the Finder to see if the application is running before sending it the Quit event.

The values of a list can be filtered by type with the syntax <plural class> of <list> or every <class> of <list>, e.g "integers of {1, 2.0, 3, true, "string"}. This does not work, however, with the class 'class': "classes of {string, 2, integer, "goodbye"}" returns an empty list, not {string, integer} as expected.

In AppleScript 1.6 and later, compiling certain numbers in scientific notation (such as 1.0e-12) will decompile in decimal form (i.e. 0.000000000001).

If an application object has an illegal URL in its "machine" container (e.g. application "Finder" of machine "eppc:/www.apple.com" – notice only one "/"), the "machine" container will be omitted and the application object will target the local machine, not a remote machine.

Pathnames of 'alias' objects may have problems if they contain accented characters. They may fail to compile, or produce errors on attempting to

display them.

Script Editor In very rare circumstances, on some computers, Script Editor 1.6 and later will stop displaying results in the Results window after a multi-line result has been displayed. Quit the Script Editor and re-launch it to see results again.

When resizing a Script Editor script window in Mac OS X, the vertical line at the left of the window is not drawn correctly. Minimize and reopen the window to redraw it correctly.

In Mac OS X, if you change your primary Language preference in System Preferences while the Script Editor is open, the Script Editor will partially -- but not completely -- adopt the new language choice. It will be better if you quit the Script Editor and restart it, but only complete after you log out and log back in again.

If you are using the Event Log window to show event results, if the result of any event contains more than 20,000 characters, the script will terminate with an error -20013. Turn off 'Show Event Results' or close the Event Log.

Script Applications ("applets") AppleScript applets handle incoming events in a last-in, first-out manner. If an applet is executing a script in response to an incoming event, and receives another incoming event, the second event will be completed before execution of the first event resumes. This is necessary so that events generated by the applet's script itself can be processed, but this may have an effect on applications (such as web servers) that send events to applets. If an applet receives a lot of events in a short period of time, the earlier events may receive timeout errors while the later events are processed.

In Script Editor 1.7, editing an applet saved as a Classic script application ("applet") and re-saving it will change its format to a "universal" applet. It can then be run in either Mac OS 9, Classic, or Mac OS X, but by default if double-clicked it will run in Mac OS X. If the applet is intended to be run in Classic (for example, if it uses Classic scripting additions), it may not function correctly. To fix this, use the Finder's Get Info command and check the "Open in the Classic environment" check box in the General Information pane.

In AppleScript 1.6 for Mac OS X, the 'Disable Startup Screen' menu item in script applications does not work. Open the script application in the Script Editor and save it again, checking the "Never show startup screen" checkbox.

Scripting Additions The Keychain Scripting application has a 'volume' property that conflicts with the 'set volume' Scripting Addition command. To set the 'volume' property in Keychain Scripting, enclose the volume property reference in parenthesis:

```
tell application "Keychain Scripting"
    set (volume of AppleShare key 1 of current keychain) to "Matia"
end tell
```

In AppleScript 1.5 and later on Mac OS X, the 'choose application' dialog box does not handle application aliases and symbolic links well. They may show up in the 'choose application' dialog box but won't necessarily behave correctly if chosen.

In AppleScript 1.5 and later in Mac OS X, using the 'choose application' scripting addition (or choosing an application during compilation) can take a long time to come up if you are connected to a network with a large number of applications on remote servers.

The prompt in the 'choose from list' command does not display correctly if it is long or contains return characters.

The Standard Additions dictionary shows many possible parameters for the 'path to' command, some of which are only available on Mac OS 9 and others that are only available on Mac OS X. In addition, the command works on many other values ("four-character codes") that do not have terms defined for them.

When using the 'path to' scripting addition, if the request is for a system folder that does not exist, it will not be created; instead, the error 'Folder is not available in this operating system version' is returned.

When the direct parameter of the 'path to' scripting addition is an application object, the result is always the path to the current application, regardless of which application is indicated by the application object.

Using the 'mount volume' command with an AppleTalk server name in a 'on server' parameter does not work in this version of Mac OS X. To mount a

volume using AppleTalk, use the AppleTalk URL syntax: 'mount volume 'afp:/at/ServerName/VolumeName'. You can supply the user name and password either in their optional parameters, in the URL, or let the user enter them. Note that because this is a URL, you may need to percent-escape special characters (such as spaces and punctuation) in the server and volume names.

When using the 'mount volume' command with a stored password in the Keychain, note that in Mac OS 10.1 it presents a server login dialog with the name and password filled in; the user must click OK or press Enter to mount the volume and allow the script to proceed.

In Standard Additions 1.7, if you use the 'write' command to write to a file that does not exist without using 'open for access' beforehand, the error message "Can't make file <path> into a file" is displayed, instead of the more familiar and accurate "File not found" error.

The Apple event manager performs coercions incorrectly from large-magnitude real numbers to integers. For example, the statement:

```
tell application "Finder"
    get capacity of disk 1 as integer
end tell
```

will succeed if the disk is under 2GB in size, but will return exactly 2GB for all larger disks (when it should fail). This problem is seen primarily in applications that return values as real numbers and don't handle the 'as' parameter themselves (the Finder is one such application). If you do the conversion separately from the event that gets the value, AppleScript will signal an error if the value is out of range (AppleScript integers can only hold values up to 512M-1).

AppleScript 1.8.1 for Mac OS X 10.1.2: Release Notes

This document contains the AppleScript 1.8.1 for Mac OS X 10.1.2 Release Notes.
This article has been archived and is no longer updated by Apple.

AppleScript 1.8.1 for Mac OS X 10.1.2 - Release Notes

AppleScript 1.8.1 for Mac OS X 10.1.2 is the version of AppleScript installed by Software Update 10.1.2 on Mac OS X systems. It is primarily intended for use in developing and running applications with AppleScript Studio.

The main features of this release are support for AppleScript Studio development and debugging, and access to UNIX functionality from any script.

This release also fixes 13 problems in AppleScript that are present in AppleScript 1.7 on Mac OS X.

Version 1.8 is installed by the December 2001 Developer Tools Update and is very similar to version 1.8.1. The only difference is that the problem of applets crashing when certain multimedia software is installed is fixed in version 1.8.1.

AppleScript 1.8.1 can use scripts developed for any version of AppleScript from 1.1 through 1.7, any scripting addition created for AppleScript 1.5 or later for Mac OS X, and any scriptable application for Mac OS 7.1 or later.

A script created with AppleScript 1.8.1 can be used by any version of AppleScript back to version 1.1, provided it does not use features of AppleScript, scripting additions, or scriptable applications that are unavailable in that version.

FEATURES:

Standard Additions

To provide better access to Mac OS X's underlying UNIX functionality from AppleScript, Standard Additions 1.8 adds a new command and extends the functionality of another.

The new do shell script command takes a string as its direct parameter and executes that string in a UNIX shell. The text can be anything from a single command with parameters to a long script. The results of the script execution ("standard out") are returned as the result of the command; if there is an error (or no output), the error output ("standard error") are returned as the error message and can be processed in an AppleScript on error handler.

Note that the environment in which a shell script is executed is a separate process in the user's process group, and does not have a terminal set up, so commands that require interaction (vi, top) will not function. There is no way at present to direct any information to "standard in" of a shell script.

Note also that do shell script uses the sh shell, which is different than the default tcsh shell used in the Terminal. command paths and environment variables are different in sh; you'll need to adjust your shell scripts accordingly.

The system attribute command has been extended to provide information on the user's environment variables. These are set up at user login time and cannot be altered. If the direct parameter to system attribute is a four-character Gestalt code, it is executed as in Standard Additions 1.7; if not, it attempts to get an environment variable by that name, returning either the value of the variable or an empty string. (Note that system attribute now will not fail with an error; it simply returns an empty string.) If called with no parameters, system attribute returns a list of all currently-defined environment variables.

AppleScript Language

The do shell script command and the scriptable Terminal allow AppleScript scripts to execute strings of text as UNIX shell scripts. Many interesting shell commands act on files, and require POSIX-style file paths as input parameters. To create POSIX-style file paths from AppleScript file objects, the property POSIX path has been added to the file and alias classes. (All file types, including file specification and file reference, support this property.) Its use is straightforward:

```
set this_file to choose file
POSIX path of this_file
```

The do shell script command and the scriptable Terminal allow AppleScript to execute UNIX shell scripts and get the results as strings of text. Frequently these strings are the pathnames of files in the UNIX format, i.e. starting at "root" with directory names separated by forward slashes. To convert these "POSIX paths" into an AppleScript file object, you can use the POSIX file object:

```
set this_path to "/etc/passwd" -- or any path returned from do shell script
set the new_path to POSIX file this_path
--> file "Mac OS X:etc:passwd"
```

AppleScript's default formatting has been changed in AppleScript 1.7 and later. If you have already used AppleScript on a given machine, you won't notice this change. The change will only be seen if you do any of the following:

1. choose "Use Default Formatting" from the "AppleScript Formatting..." dialog box in Script Editor
2. delete your AppleScript Preferences
3. set up a new user (or log in on a user account that has never used AppleScript)
4. do a clean operating system install without saving or retaining user preferences

BUG FIXES:

AppleScript Language

AppleScript 1.7 could not perform certain operations on file names or file paths that contain certain characters (such as accented characters like é). This has been fixed in AppleScript 1.8. [2816363]

In AppleScript 1.7, references to the process class of the Finder on a remote machine did not work. This has been fixed in AppleScript 1.8 and later. Note that you need to be running Mac OS X 10.1 or later on the target machine, and Mac OS X 10.1.2 or later on the machine executing the script. [2775419]

With AppleScript 1.6 and 1.7, applications that attempted to convert Unicode text to plain text would get an error (though AppleScript itself could perform such conversions successfully). This prevented older applications from being able to use information (such as file names) that is now supplied as Unicode text. This has been fixed in OpenScripting.framework version 1.8 and later. [2816500]

Certain development environments can create scripts whose parent is an application object, rather than a top-level script. Attempting to get any parent properties of such objects (including the information returned by OSAGetScriptInfo) would cause AppleScript to crash. This has been fixed in AppleScript 1.8. [2755096]

AppleScript Applications: Applets

In Mac OS X version 10.1 and 10.1.1, installing certain multimedia software (such as Roxio Toast or QuickTime 5) would cause all applets to crash on launching. This has been fixed with AppleScript 1.8.1 [2785067]

With AppleScript 1.7 in Mac OS 10.1, applets that are set to show their startup ("splash") screens occasionally failed to do so. This has been fixed in AppleScript 1.8. The applications do not need to be recompiled or re-saved. [2756226]

Standard Additions

In Standard Additions 1.7, if the path to command was requested to return the path of a folder that did not exist (such as scripting additions folder from local domain), it would fail. In previous versions, and now in 1.8 as well, it creates the folder and returns the path to the created folder. Note that if the user does not have authorization to create the folder (e.g. is not an administrator and requests a nonexistent folder in the System domain), the operation will still fail. [2751119]

In Standard Additions 1.7 and earlier for Mac OS X, the description of the choose application command stated that it allows users to choose a running application. On Mac OS X it allows users to choose any application, running or not. [2785713]

In Standard Additions 1.7, using the mount volume command with an AppleTalk server name in a on server parameter did not work. This has been fixed in Standard Additions 1.8. [2656820]

In Standard Additions 1.7, the store script command would crash if no in parameter was supplied. This has been fixed in Standard Additions 1.8. [2782590]

Previous versions of Standard Additions improperly list the parameters for the store script command. Both the direct parameter (the script) and the in parameter (the file) are optional. If the script is omitted, an empty script is stored in the file; if the in parameter is omitted, the user is prompted for a file name. [2784735]

The path to command in the Classic environment of Mac OS X 10.1.1 and earlier returns the path to the script when asked for the path to an application. This has been fixed in the Classic environment of Mac OS X version 10.1.2. [2747285]

The choose application command in the Classic environment of Mac OS X 10.1.1 and earlier fails with a memory full error (-108). This has been fixed in the Classic environment of Mac OS X version 10.1.2. [2804619]

Commands

The osacompile command would fail if provided with an -i parameter specifying a nonexistent file. In Mac OS X 10.1.2 it is more lenient and issues a warning, but continues compilation. [2796415]

KNOWN PROBLEMS:

Some applications that create and/or execute scripts (such as Script Debugger) will occasionally crash when trying to get certain information about a

script. If you need to use these applications, do not upgrade to AppleScript 1.8. [2811897]

AppleScript 1.7 could not open scripts saved on Mac OS 9 by any version of AppleScript if those scripts contained references to applications on remote machines. AppleScript 1.8 and later can open those scripts, but omits the first two characters of the host name in the application's URL. You must manually correct the application URL and recompile the scripts. [2781523]

On some rare occasions (often during recording), the name of an application in a tell statement is changed to "AEServer.". Change the name back to the original application name and recompile the script. [2822232]

AppleScript Studio applications occasionally crash while being debugged. [2793351]

In AppleScript 1.6 and earlier, the alias and file classes previously used Macintosh File System functionality to interpret pathnames. As a side effect, expressions like alias ":" and file (myPath & "::") would do interesting things, like return an alias to the directory containing the current application, or navigate up a file hierarchy. In AppleScript 1.7 and later, alias and file support long and Unicode file and path names, using Core Foundation functionality to interpret pathnames, with different side effects. On Mac OS X, alias ":" specifies the root directory, and on both Mac OS 9 and X, sequences of multiple colons are ignored. To get the path to the current application, use path to me; to navigate up a folder hierarchy, use the Finder's container property. [2833120]

The osascript command-line tool will truncate output text if it contains a null character. [2827241]

Developer Release Notes

In Mac OS X 10.1 through 10.1.1, scripting additions would have their initialization function called at application launch time, but their termination functions would not be called when the application quit. Scripting additions that used system resources would not get a chance to release those resources. In OpenScripting.framework version 1.8 and later, every scripting addition termination function is called when an application exits. [2811696]

AppleScript 1.7 for Mac OS 9 and Classic: Release Notes

This document contains the AppleScript 1.7 for Mac OS 9 and Classic Release Notes.
This article has been archived and is no longer updated by Apple.

AppleScript 1.7 for Mac OS 9 and Classic - Release Notes

AppleScript 1.7 for Mac OS 9 and Classic is the version of AppleScript that is installed by Software Update 9.2.2 on Mac OS 9 systems. It is primarily intended for use in the Classic environment of Mac OS X, and for scripters who are expecting to migrate their scripts and applications to Mac OS X.

The main features of this release provide script interchangeability with AppleScript 1.7 on Mac OS X.

This release also fixes 29 problems in AppleScript that are present in AppleScript 1.6 on Mac OS 9.

AppleScript 1.7 can use scripts developed for any version of AppleScript from 1.1 through 1.6 on Mac OS 9 (and 1.5 through 1.8.1 on Mac OS X), any scripting addition created for AppleScript 1.1 or later (except scripting additions created exclusively for Mac OS X), and any scriptable application for Mac OS 7.1 or later.

A script created with AppleScript 1.7 can be used by any version of AppleScript from 1.1 through 1.8.1, provided it does not use features of AppleScript, scripting additions, or scriptable applications that are unavailable in that version.

FEATURES:

Standard Additions

In AppleScript 1.7 and later, AppleScript will load Standard Additions that are configured as "bundles" or "packages."

AppleScript Language

All Mac OS Extended ("HFS Plus") format disks can store files with file names in Unicode text and longer than 32 characters. When older software accesses such files, those names are represented in an encoded form (with something like "#28AF" in the name). With AppleScript 1.6 and earlier, the results of many Standard Additions commands (like path to, info for, and list folder), as well as creation and display of alias and file objects, required and returned encoded names. In AppleScript 1.7, all file names are represented as Unicode text. Encoded file names are no longer supported. *Note that the Finder in Mac OS 9 only supports encoded names, but the Finder in Mac OS X and Classic only supports long names.*

In most cases this change will be transparent, but some applications or scripting additions may not be able to understand the new data format. For such applications, use as alias when sending a file object to an application or scripting addition. You may also notice that file and alias pathnames are now displayed in the default application font instead of the "Values" style defined in AppleScript Formatting.

Because many Mac OS X files use UNIX-style line endings (using the linefeed character, or ASCII character 10), AppleScript versions 1.7 and later explicitly support embedding the linefeed character in strings by using the sequence "\\n". Scripts that use this feature can be run on older versions of AppleScript, but if decompiled, the linefeed character will not be visible in the decompiled output (but will recompile correctly).

Script Applications ("applets")

Prior to AppleScript 1.4.3, script applications ("applets") were stored in a "universal" format that worked on both 680x0-based and Power PC-based Macintosh models. Because that format was 680x0-based, it would not work on Mac OS X, so a "Mac OS X applet" format was introduced in AppleScript 1.4.3. With improvements in Mac OS X since that time, it is now possible to produce a script application that works on 680x0-based, Power PC-based Mac OS 9, and Mac OS X configurations. Script Editor 1.7 again offers only one choice for saving script applications. Older formats continue to work on the configurations they were saved for. Note that a "universal" applet will run native in Mac OS X when double-clicked in the Mac OS X Finder. If you would like it to be executed in the Classic environment (to take advantage of older Standard Additions, for example), set the "Open in the Classic environment" check box in its Finder Get Info panel.

BUG FIXES:

AppleScript Language

Certain operations in third-party script editors and debuggers are unstable with AppleScript 1.6 and earlier. AppleScript 1.7 for Mac OS 9 and Classic makes those debuggers more stable.

AppleScript 1.5.5 and 1.6 would fail when attempting to convert a file path string to a file specification, either by explicit coercion ("Macintosh HD:" as file specification) or as an object reference (file specification "Macintosh HD:"). This is fixed in AppleScript 1.7 and returns the generic file form (file "Macintosh HD:").

In AppleScript 1.6, conversions from Unicode text to plain text worked in AppleScript itself, but would not work if invoked by applications. This caused problems when sending Unicode text to applications that expected plain text. This has been fixed in AppleScript 1.7.

In AppleScript 1.6, Unicode text values stored in script properties of a saved script could not be reloaded reliably. This has been fixed in AppleScript 1.7.

In AppleScript 1.6, Unicode text received from certain applications that included a Unicode byte-order mark would behave incorrectly; the text would appear to begin with the Euro symbol, and some operations would fail. AppleScript 1.7 handles Unicode text with byte-order marks correctly.

AppleScript 1.6 on Mac OS 9 and Classic cannot get any information about process objects of the Finder on a Mac OS X machine. AppleScript 1.7 on Mac OS 9 and Classic can do this.

Accessing paragraphs of AppleScript strings did not work correctly in AppleScript 1.5 through 1.6 if the line endings were Windows-style (CRLF). The result would be only the first half of the text paragraphs, interspersed with an equal number of blank strings. This has been fixed in AppleScript 1.7 and later.

AppleScript 1.5 through 1.6 on Mac OS X often launched applications unnecessarily in order to get their terminology, and often used the terminology of the script editing application (such as Script Debugger) instead of application terminology. This has been fixed in AppleScript 1.7.

In AppleScript 1.5 through 1.6, a script's global variables could be lost under certain rare circumstances. If a script contains a tell block that targets a variable, and that variable specifies an application that does not exist, the "Where is application <name>?" dialog would be presented when the script is executed. After that point, further references to global variables in the handler that included the tell block would fail. This has been fixed in AppleScript 1.7.

In somewhat rare circumstances, comparing two references to the same file for equality can fail even if both references refer to the same file. This is true in AppleScript 1.0 through 1.6 and has been fixed in AppleScript 1.7.

AppleScript 1.6 for Mac OS 9 and AppleScript 1.7 for Mac OS X have different ways of storing the address of a remote machine using the "eppc://" URL type. A script that targets a remote application that was created on Mac OS X cannot be used by AppleScript 1.6 on Mac OS 9 or Classic, but can be used by AppleScript 1.7 for Mac OS 9 or Classic. Note that scripts created by AppleScript 1.1 through 1.7 on Mac OS 9 or Classic that target remote applications cannot be read by AppleScript 1.7 on Mac OS X at all, but can be read by AppleScript 1.8 on Mac OS X

Due to a problem in AppleScript's script parser, the language formations isn't, doesn't, and possessives ending with "'s" would all accept a vertical bar or a double-quote character in place of the s or t following the apostrophe. In AppleScript 1.7 and later, these constructions (for example, "doesn'|" or "AppleScript"' version") are correctly noted as syntax errors.

Script Editor

Script Editor 1.4.3 through 1.6 displayed an unhelpful error message if you attempted to print a script without first selecting a printer in the Chooser. Script Editor 1.7 displays a more descriptive message.

With Script Editor 1.4.3 through 1.6, using the "Paste Reference" menu item would not work properly if the Clipboard contained more than one selected Finder file. This has been fixed in Script Editor 1.7.

Script Editor 1.6, when trying to save a script that could not be compiled, would display an error message that read, "The %1$@ "%2$2" wouldn't compile; you won't be able to save it in compiled form, only as text." This has been fixed in Script Editor 1.7 to display the correct script name.

AppleScript Applications: Applets

In AppleScript 1.4.3 through 1.6, a running AppleScript applet would become non-responsive to any events (except command-period) after processing some incoming events. This has been fixed in AppleScript 1.7.

In AppleScript 1.6, under certain circumstances, calling a handler in an applet that has not been launched could cause a "Can't continue" error. This has been fixed in AppleScript 1.7 and later.

Standard Additions

In Standard Additions 1.6 and earlier, the info for scripting addition would fail if any piece of information in the requested file or directory was unavailable. On UFS disks (DVD-ROMs and certain Mac OS X disks) and mounted NFS volumes, the file creation date is unavailable, and accessing it causes a -8850 error (in trying to convert it to Universal Time). Starting with Standard Additions 1.7, any missing piece of information in the info for result is provided as the value missing value without failure. In AppleScript 1.6 and earlier, magnitude comparisons (<, =<, >, >=) against the missing value would signal a

coercion error for most types; in 1.7 and later, these comparisons always return false without error. These two changes ensure that scripts that use info for against UFS and NFS volumes do not fail, though they may not get correct results because any comparison to the creation date is always false.

In Standard Additions 1.6 on both Mac OS 9 and Mac OS X, the info for scripting addition would return an error -1401 for a nonexistent file, rather than the normal -35 returned in previous versions. In Standard Additions 1.7 trying to get the info for a nonexistent file (or a file in a nonexistent directory or inaccessible disk) will return the customary -35 error.

Mac OS 9.1 introduced the concept of a "package" application, that is, an application composed of a folder of several files and folders, which is treated as an integral application by the Finder and other files. The info for scripting addition in AppleScript 1.6 and earlier treated such packaged applications as folders, not files, and would not return application-related information about them. In Standard Additions 1.7 and later, getting the information for any directory (including package folders) returns an additional record item package folder; if this Boolean value is true, then the directory is a package, and the application's type and creator are provided in the record. Note that info for in Mac OS 9 cannot return the name extension and displayed name record items provided in Mac OS X.

In Standard Additions 1.6, canceling the dialog box presented by the choose application command does not return error -128, as it does in most other scripting additions. This has been fixed in Standard Additions 1.7.

The choose from list command in Standard Additions 1.4 through 1.6 allowed the scripter to create a situation where it would return an empty selection even if the scripter specifically disallowed that case. (This can be done by providing a default item that does not appear in the list). In Standard Additions 1.7 and later, the "OK" button will not be enabled in such cases.

In versions of Standard Additions prior to 1.7, the choose URL command's using editable URL parameter was present in the Standard Additions dictionary but was nonfunctional (URLs were always editable regardless of the setting of the parameter). It behaves correctly in Standard Additions 1.7 and later: if set to false, the user can choose a URL only by browsing, not by editing the URL in the text box.

From AppleScript 1.1, the offset of scripting addition command has not worked correctly when the direct parameter is styled text. It also has not worked correctly with the newly-introduced Unicode text type. In Standard Additions 1.7 and later it produces correct results with both styled and Unicode text. Note, however, that this introduced a problem in which offset of will not work correctly with styled text from some sources (notably the the clipboard command).

The read command in Standard Additions 1.6 had specific problems with the using delimiters parameter: in previous versions, read f as list using delimiters {tab} would return a list, but in AppleScript 1.6, it returned a list of one-item lists. In AppleScript 1.7 and later it behaves as it did prior to version 1.6.

The read command in Standard Additions 1.6 had specific problems with the before and until parameters if used in conjunction with the as parameter. Instead of returning a value of a given type, it would return random data or an error. This has been fixed in Standard Additions 1.7 and later.

Standard Additions 1.5 through 1.6 changed the way that the random number seed worked in the random number scripting addition. Older versions used the system clock as the seed value if no seed value (or a seed value of 0) was provided; Standard Additions 1.5 and 1.6 always use a seed value of 0 in these cases. In Standard Additions 1.7 the older behavior has been restored. In addition, the seed value is now taken from the 60Hz "ticks" counter rather than the system clock, because the increased speed of new machines makes it more likely that two consecutive random number calls may receive the same system clock time as their seed value.

In Standard Additions 1.5 and 1.6, the random number command generated numbers that were not evenly distributed across the range: the first and last values in the random number range would occur far less frequently than other numbers in the range. This has been fixed in Standard Additions 1.7.

In Standard Additions 1.6, the store script command would crash if no in parameter was supplied. This has been fixed in Standard Additions 1.7: if the in parameter is omitted, a Navigation dialog is presented and the file is saved in the file the user specifies.

Previous versions of Standard Additions improperly list the parameters for the store script command. Both the direct parameter (the script) and the in parameter (the file) are optional. If the script is omitted, an empty script is stored in the file; if the in parameter is omitted, the user is prompted for a file name.

DEVELOPER RELEASE NOTES:

Historically, when an application is sent an event that contains a whose clause, AppleScript includes a 'cons' attribute (enumConsiderations) that contains a list of AppleScript consideration enumerators that are currently ignored (such as case, application responses, etc.) This is incomplete,

awkward to traverse, and not useful to events that don1t include Whose clauses. As of AppleScript 1.7, every event sent by AppleScript to an application or scripting addition includes a 'csig' (enumConsidsAndIgnores) attribute whose value is a typeUInt32 bit field with bits set for every consideration or ignore currently in effect.

To support a wider variety of sources of script text, the compiler in AppleScript 1.7 and later now accepts all three prevalent styles of line endings: Macintosh style (carriage return, ASCII 13), UNIX style (linefeed, ASCII 10) and Windows style (CRLF, ASCII 13-ASCII 10). Decompiled source will continue to be Macintosh-style.

As of AppleScript 1.7, the keyAEKeyData field of object specifiers with keyAEDesiredClass of cFile or typeAlias is now typeUnicodeText, rather than typeChar. This allows us to store long Unicode names in object specifiers. All appropriate system coercion handlers have been changed to accommodate this, so coercing an object specifier to typeAlias, typeFSRef, typeFileSpecification, or typeFileURL will work correctly. If your code specifically unpacks an object specifier, and tries to get the keyAEKeyData as typeChar, automatic coercions will operate, but they may only produce characters in the current system script. For Mac OS 9.2.2 and later, you should update your applications or scripting additions to use the Unicode pathname APIs to the file system, and use the long Unicode path names provided in these object specifiers.

Bug Fixes (Developer)

The AppleScript component would be left in an indeterminate state after a call to OSASetProperty, and would often fail or crash on a subsequent operation. This has been fixed in AppleScript 1.7 for Mac OS 9 and Classic.

The return value from the OSAScriptError function historically returned an error range that was a record of two short integers. This was inaccurate for script text that was greater than 32K in length. AppleScript 1.7 and greater returns a record of two typeLongInteger values. Existing code that gets these values as typeLongInteger would have coerced too-small results and will now work correctly; older applications that expected short integers and only allocated sufficient space for them will continue to get erroneous results on long scripts, and should be revised to accommodate the new return value.

KNOWN BUGS IN APPLESCRIPT 1.7 FOR MAC OS 9 AND CLASSIC

AppleScript

If the clipboard contains text that is not styled, the the clipboard scripting addition command will return a styled text value that is malformed and causes the offset of command to crash. Convert the clipboard value to Unicode text before using the offset of command.

Certain AppleScript development environments can create scripts whose parent property is an application object, rather than a top-level script. Attempting to get any parent properties of such objects will cause AppleScript to crash.

There are some reports of serious performance degradation with some scripts and some applications in AppleScript 1.7 on Mac OS 9.2.2. Running the script in the Script Editor or a third-party editor, rather than in a script application or an application's own Script menu, often seems to restore expected performance.

Attempting to execute a script in Claris Emailer when running in the Classic environment will cause Claris Emailer to crash.

Operations on file and alias objects may fail if the name of any folder containing the designated file contains a non-English character (for example, Japanese text, accented characters, or certain symbols). Note also that for forward compatibility with Mac OS X, volume names are now case-sensitive in AppleScript. This is true in Mac OS X and is enforced in Mac OS 9 to maintain compatibility.

The Finder in Mac OS 9 returns values for special folders (desktop, system folder, etc.) that are incompatible with many commands in Standard Additions 1.7. To avoid this problem, either use the path to command to get references to these special folders, or coerce the Finder's references to aliases before using them with Standard Additions commands (or third-party scripting additions). For example:

```
tell application "Finder"
    info for desktop
end tell
```

should be changed to either:

```
info for (path to desktop folder)
```

or changed to:

```
tell application "Finder"
    info for alias desktop
end tell
```

AppleScript 1.7 will fail on its first attempt to access a process object of the Finder running on a remote Mac OS X machine. (It will succeed on remote Mac OS 9 machines, on local Mac OS X machines [e.g. from Classic to X], on any other property or element of the Finder other than process, and on

any process object after the first attempt).

In AppleScript 1.6 and earlier, the alias and file classes previously used Macintosh File System functionality to interpret pathnames. As a side effect, expressions like alias ":" and file (myPath & "::") would do interesting things, like return an alias to the directory containing the current application, or navigate up a file hierarchy. In AppleScript 1.7 and later, alias and file support long and Unicode file and path names, using Core Foundation functionality to interpret pathnames, with different side effects. On Mac OS X, alias ":" specifies the root directory, and on both Mac OS 9 and X, sequences of multiple colons are ignored. To get the path to the current application, use path to me; to navigate up a folder hierarchy, use the Finder's container property.

A Macintosh with Mac OS X installed that is booted into Mac OS 9 cannot run Mac OS X applications. If you try to open a script that targets a Mac OS X application in a tell block, it will display the "Where is application (name)?" dialog; if you select a Mac OS X application, AppleScript will fail with the error "File (name) not found." This error message is somewhat misleading; the actual error is that you selected a Mac OS X application that cannot be used on Mac OS 9.

Script Editor

The "Open Dictionary" menu command in Script Editor 1.7 will not display the iTunes 2 application. If you want to view the iTunes 2 dictionary, drag iTunes 2 (or an alias to it) and drop it on the Script Editor application icon.

Scripting Additions

In Standard Additions 1.7, if the path to command is requested to return the path of a folder that does not exist, it will fail. In previous versions it would create the folder and return the path to the created folder.

The dictionary entry for the choose application command erroneously lists a multiple selections allowed optional parameter. This parameter is available in Mac OS X only and is ignored in Mac OS 9.

The open for access command in Standard Additions 1.7 does not set the type and creator of newly-created files to type 'TEXT', creator 'ttxt', so the files cannot be read by most other applications or double-clicked in the Finder. In the following example, after creating file this_file, perform the following steps:

```
tell application "Finder"
    set file type of file this_file to "TEXT"
    set creator type of file this_file to "ttxt"
end tell
```

Apple Pro Speakers: "Device Cannot Be Recognized" Alert

This document describes the alert message that appears when the Apple Pro Speakers are not fully inserted into the Apple Speaker sound output port

This article has been archived and is no longer updated by Apple.

Symptom

If the Apple Pro Speakers are not fully inserted into the Apple Speaker sound output port ("mini-jack"), an alert box with this message appears:

> "The device plugged into the Apple speaker mini-jack cannot be recognized. Remove the plug from the jack. Then plug it back in and make sure it is fully inserted."

Figure 1 Alert Message under Mac OS X 10.1.2

Figure 2 Alert Message under Mac OS 9.2.2

Solution

- Follow the instructions in the alert message and remove the speaker plug from the sound output port, then fully reinsert the plug.
- See technical document 31314 "**Apple Pro Speakers: No Sound From Speakers**" for further troubleshooting.

Final Cut Pro 3: Before You Install Final Cut Pro 3

This document contains the Before You Install Final Cut Pro 3 information.

This article has been archived and is no longer updated by Apple.

Before You Install Final Cut Pro 3

This document contains system requirements and things to do before you install the application. It also includes information on new features, how to access late-breaking news, where to start, and using the tutorials. For the latest information on product updates, tips and techniques, third-party software, and qualified third-party devices, visit the Final Cut Pro Web site at http://www.apple.com/finalcutpro

System requirements

You'll need the following hardware, software, and video equipment for Final Cut Pro:

Hardware and video equipment

- Power Macintosh G3/350 megahertz (MHz) or faster with built-in FireWire
- PowerBook G3/400 MHz or faster with built-in FireWire
- iMac 350 MHz or faster with built-in FireWire
- iBook (Dual USB) 500 MHz or faster with built-in FireWire
- A CD or DVD drive
- 256 MB random access memory (RAM) (384 MB or greater required for G4 Real-Time editing)
- A 6 gigabyte (GB), Audio/Video rated disk drive (20 GB or greater recommended)
- Dual-monitor support (optional)
- A Final Cut Pro-qualified video capture card for capturing video from an external source or exporting video to tape (optional)
- The correct FireWire or device control cable and any additional cables you may need for connecting your deck or camcorder to your computer
- A DV (digital video) source, such as a camcorder or deck, connected to your computer via a FireWire port (FireWire is also referred to as IEEE 1394 or Sony i.LINK.)
- An analog video source, a Final Cut Pro-qualified video capture card or device, and an adapter cable to connect the video source to your computer

Note: G4 Real-Time editing requires a single or dual-processor Power Macintosh G4 500 MHz or faster (PowerBook G4 667 MHz or faster recommended for real-time mobile DV editing). For more information about G4 Real-Time editing, see the Final Cut Pro Web site at www.apple.com/finalcutpro.

Software

- Mac OS 9.2.2 or Mac OS X 10.1.1 or later
- QuickTime 5.0.4 or later

Before you install Final Cut Pro

Important The French, German, and Japanese versions of Final Cut Pro are only supported on a matching localized French, German, or Japanese version of the Mac OS. Multiple localized versions of Final Cut Pro from different countries on a single system are not supported. For example, if your computer has the French version of the Mac OS installed on it, you cannot install both the French and German versions of Final Cut Pro. For more information, see the Final Cut Pro Web site at http://www.apple.com/finalcutpro

Make sure you do the following before you install the software:

- Turn off any virus protection and security software that you may have installed on your computer.
- Upgrade to Mac OS 9.2.2 or later
  Final Cut Pro for Mac OS 9 requires you to use the Software Update control panel to upgrade to Mac OS 9.2.2. If you don't have Mac OS 9, you need to install it on your computer before you can upgrade to Mac OS 9.2.2.
- Upgrade to Mac OS X 10.1.1 or later
  Final Cut Pro for Mac OS X requires that you upgrade to Mac OS X 10.1.1. This requires you to first upgrade to Mac OS X 10.1, then use the Software Update pane of the System Preferences to install the latest Mac OS X updates.
- Install QuickTime 5.0.4 and unlock QuickTime Pro
  QuickTime 5.0.4 is included on the Final Cut Pro CD for both Mac OS 9 and Mac OS X. See the "Final Cut Pro and QuickTime Pro Registration Numbers" document that came with Final Cut Pro or the installation chapter in Volume 1 of the manual for instructions on installing this software. To unlock QuickTime Pro, you need the registration number that's located on the front of the document.

Finding out about new features, late-breaking information, and an overview of the application

After you install Final Cut Pro, you can learn about new features and late-breaking information on known issues.

- To get the latest information about known issues with the application, choose Final Cut Pro Help from the Help menu and click "Late-breaking news."
- To find out about new features and enhancements, choose What's New? from the Help menu.
- To get a brief overview of the major tasks and windows in Final Cut Pro, choose Where Do I Start? from the Help menu.

Using the tutorials

There are several tutorials that come with Final Cut Pro. These are available in print in a separate book.

Using the documentation

The Final Cut Pro user's manual has been divided into three volumes for ease of use. Also included is a new features addendum, What's New in Final Cut Pro 3.

- Volume 1, Getting Started, Input, and Output, covers everything you need to know to set up your Macintosh with Final Cut Pro, capture video for use in your project, and output to a variety of formats.
- Volume 2, Editorial, focuses on basic and advanced editing techniques in Final Cut Pro, including transitions, trimming and working with audio.
- Volume 3, Effects and FXScript, covers Final Cut Pro's compositing tools, including motion settings, filters, generators, and how to use FXScript to create your own custom filters and generators.
- What's New in Final Cut Pro 3 covers new tools and commands that are available in Final Cut Pro 3.

Mac OS X: USB Printer Drivers No Longer Available

Third-party inkjet drivers are no longer available from Apple.
This article has been archived and is no longer updated by Apple.
Mac OS X includes printer drivers for some popular USB inkjet printers. A printer driver update was available from Apple. However, this update is no longer available as the same or newer printer drivers are available directly from the printer manufacturer.

For additional printer drivers for Mac OS X, check with the manufacturer of your printer.

Some Printer Manufacturer's Web sites:

Canon: http://www.canon.com

Epson: http://www.epson.com

Hewlett-Packard: http://www.hp.com

Macintosh: How to Connect Audio Devices to Your Computer

This document provides general guidelines on how to import audio from both digital and analog sources into your Apple computer.

This article has been archived and is no longer updated by Apple.

There are several ways to import audio from various sources into your computer. This document provides general guidelines on various methods.

Analog source versus digital source

Vinyl records, cassettes, microphones are examples of analog media and sources. Compact discs (CD), MiniDiscs (MD), and digital audio tapes (DAT) are examples of digital media. All of these can be imported into your computer using either an analog or digital signal depending on the equipment used. In this document CDs, MiniDiscs, and DATs will all be considered digital sources.

What You Need

Computer with sound input port ("microphone jack")

Required:

- proper cables
- audio software

Optional:

- USB, FireWire, PC Card, or PCI audio input device

Computer without sound input port ("microphone jack")

Required:

- proper cables
- audio software
- USB, FireWire, PC card, or PCI audio input device

Audio input devices

Some Macintosh models have a sound input port ("microphone jack"). This port can be used as an analog input. If you need to record higher quality audio, you will need to purchase a separate audio input device (also referred to as a sound card). For portable applications, there are PC cards available that allow both analog and digital signals to be recorded. USB audio devices and FireWire audio devices can be used on both portable and desktop Macintosh models. PCI audio cards can only be used in desktop Macintosh computers with PCI slots.

Cables

The type of connectors on the analog input device and what computer you have dictate what cable and/or adapters you need.Here are some examples

Cable	Source	Input device
3.5 mm stereo to RCA	headphone cassette player	PCI/FireWire/USB analog input
3.5 mm to 3.5 mm	headphone cassette player	Macintosh microphone input
RCA to RCA	stereo receiver aux output	PCI card analog input
SPDIF to SPDIF (Digital Coax - RCA)	DAT digital output	PCI/USB/FireWire digital input
TOS to TOS (Digital Optical)	MiniDisc optical output	PCI/USB/FireWire digital input

Audio Software

In order to import the audio onto your computer's hard disk, you need software that allows you to record the audio. If you purchased any type of audio input device, it probably came with audio software you can use. If not, you can get this type of software as shareware/freeware from many

Web sites, or you can purchase a commercial application.

Where to find additional information

Information on Hundreds of software titles and hardware products, including many audio related products, are available in the Macintosh Product Guide (http://guide.apple.com/).

WebObjects 5: Reverse-Engineering Oracle Databases With EOModeler

This article has been archived and is no longer updated by Apple.

EOModeler's New Database Wizard lets you reverse-engineer a database, but gives no control over which tables are available. By default, only the user's tables can be selected. This document describes how to control which tables of an Oracle database are selectable, including views, aliases, and synonyms in schemas owned by other users.

Applicable products

- WebObjects 5.1
- WebObjects 5.2
- WebObjects 5.3

Important: This technique works only for WebObjects 5.1, 5.2 and 5.3. It does not work for WebObjects 5.0. Developers using WebObjects 5.0 must write a JDBC plugin. Details on writing a JDBC plugin are in Technical Note 2027 (http://developer.apple.com/technotes/tn/tn2027.html).

How to modify Java Properties

The version of EOModeler included with WebObjects 5.1 and later uses Java's properties mechanism to control the New Database Wizard's behavior.

Note: For more information about how WebObjects uses Java's properties, see this article). Look at the section titled "Accessing The Properties".
WebObjects 5.3 and later only: The EOModeler application resides under /Developer/Applications/WebObjects/ This article does not apply to the EOModeler plug-in used with Xdesign/Xcode.

Follow the steps below to modify the Java properties.

1. Quit EOModeler if it is open.
2. Copy the file `/System/Library/Frameworks/JDBCEOAdaptor.framework/Versions/Current/Resources/Properties` to your home directory.

   With Microsoft Windows, replace `/System` with the value of `$NEXT_ROOT`, usually `C:/Apple`.

3. Rename the new file WebObjects.properties.
4. Open WebObjects.properties in a text editor.
5. To show all tables owned by all users, change these lines:

   ```
   #  The default is to use the USER's schema
   #jdbcadaptor.oracle.wildcardPatternForSchema=null
   ```

   ... like this:

   ```
   #  Show everyone's tables (including SYSTEM)
   jdbcadaptor.oracle.wildcardPatternForSchema=%
   ```

6. To show all tables owned by the user STEVE, change these lines:

   ```
   #  The default is to use the USER's schema
   #jdbcadaptor.oracle.wildcardPatternForSchema=null
   ```

   ... like this:

   ```
   #  Show STEVE's schema instead of mine
   jdbcadaptor.oracle.wildcardPatternForSchema=STEVE
   ```

7. To list the tables using a custom SQL query, use the sqlStatementForGettingTableNames property. Here's an example that shows all non-system views and private synonyms. Change these lines:

   ```
   #  The default is to use JDBC API instead of executing a SQL statement.
   #jdbcadaptor.oracle.sqlStatementForGettingTableNames=null
   ```

   ... to this:

   ```
   # Use this SQL statement to determine table names
   jdbcadaptor.oracle.sqlStatementForGettingTableNames=SELECT DISTINCT OWNER || '.' ||
   TABLE_NAME FROM SYS.ALL_CATALOG WHERE OWNER NOT IN ('SYS', 'SYSTEM', 'PUBLIC') AND TABLE_TYPE IN ('VIEW', 'SYNONYM')
   ```

8. Save the WebObjects.properties file, and test the changes by opening EOModeler and creating a new model. Choose the JDBC adapter and proceed with the New Model Wizard until the list of tables appears.

Troubleshooting Tips

1. Make sure that your table names (entity names) are unique. Otherwise, EOModeler can generate errors, such as:

```
-[NSCFDictionary setObject:forKey:]: attempt to insert nil value
```

2. Check that your SQL statements are correct to avoid the following type of error:

```
EvaluateExpression failed: <OraclePlugIn$OracleExpression: <<.... >>
Next exception:SQL State:42000 -- error code: 936 -- msg: ORA-00936: missing expression
```

3. WebObjects 5.3: The Oracle Database can take a long time to fetch all tables when setting the following property:

```
jdbcadaptor.oracle.wildcardPatternForSchema=%
```

   During that time, the EOModeler application seems to be unresponsive (The "Force Quit" panel will show EOModeler as non-responding). Wait until the fetch completes, and EOModeler will return to the active state.

Published Date: Feb 19, 2012

WebObjects 5.1.1: WebObjects 5.1.1 Update Overview

This document has been obsoleted by a newer update. Refer to **WebObjects Current Patch List**, document 70037, for information on the most current updates for WebObjects. This document is still available in the Knowledge Base as a convenience to customers who have not yet upgraded to the most current update.
This article has been archived and is no longer updated by Apple.
WebObjects 5.1.1 includes updated versions of several WebObjects class and jar files. Some WebObject project types make copies of these files when the project is built. As a result, some projects may need to be rebuilt to take advantage of the issues addressed in the update. For example, when a JSP/Servlet war archive is created, several jars are copied into the war file. At least one jar (WOJSPServlet_client.jar, from the WOJSPServlet.framework) is always copied, and additional framework jars may be copied into the war as well, depending on the project. After installing WebObjects 5.1.1, either the application must be rebuilt (recreating the war archive), or the war archive must be manually updated, using the jar tool.

This update includes modified WebObjects client-side Java classes and jars. On Mac OS X (Server) the update installer automatically places the modified classes and jars in your web server's document root directory. On Solaris and Windows, the update installer places the modified classes in the WebObjects installation (in `$NEXT_ROOT/Library/WeObjects/WODocumentRoot/WebObjects`) but does not copy them to your web server's document root directory. To use the new files, you must install them in the correct location for the web server being used.

WebObjects 5.1.1 for Mac OS X (Server) 10.1.3

Important: There are two mutually exclusive updates for this platform. If you have WebObjects 5.1 Developer installed on Mac OS X 10.1.3, you need the WebObjects 5.1.1 Developer update. If you have WebObjects 5.1 Deployment installed on Mac OS X Server 10.1.3, you need the WebObjects 5.1.1 Deployment update. You do not need both on any system.

This update is available through the Software Update feature of Mac OS X. If you use this method, only the proper update for the software which you have installed on your system will be visible and available for download. If you prefer to download and install the package manually, follow the instructions below.

Note: WebObjects 5.1.1 Deployment requires Mac OS X Server 10.1.3 or later as well as the 10.1.3 Server Update and the Java 1.3.1 Update 1. WebObjects 5.1.1 Developer requires Mac OS X 10.1.3 or later as well as the December 2001 Mac OS X 10.1 Developer Tools and the Java 1.3.1 Update 1. If you have not yet updated to the correct version of Mac OS X (Server), Developer Tools, and Java, you must do so before installing WebObjects 5.1.1. The Mac OS X 10.1.3 and December 2001 Mac OS X 10.1 Developer Tools images are available on the Apple web site.

If you are creating a new Mac OS X WebObjects 5.1 development system, you should install the software in the following order:

1. Mac OS X 10.1.3
2. December 2001 Mac OS X 10.1 Developer Tools
3. Java 1.3.1 Update 1
4. WebObjects 5.1 Developer
5. WebObjects 5.1.1 Developer

Manually Installing WebObjects 5.1.1 Developer on Mac OS X 10.1.3

These instructions are for manually downloading and installing WebObjects 5.1.1 Developer. If you are installing using Software Update, see the section titled "**WebObjects 5.1.1 for Mac OS X (Server) 10.1.3**", above.

Note: WebObjects 5.1.1 Developer requires Mac OS X 10.1.3 or later as well as the December 2001 Mac OS X 10.1 Developer Tools and the Java 1.3.1 Update 1. If you have not yet updated to the correct version of Mac OS X, Developer Tools, and Java, you must do so before installing WebObjects 5.1.1. The Mac OS X 10.1.3 and December 2001 Mac OS X 10.1 Developer Tools images are available on the Apple web site.

1. Download `WO51MacOSXDevUpdate1.pkg.tar`, the update package for Mac OS X 10.1.

   `WO51MacOSXDevUpdate1.pkg.tar` is available from:

   http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/5.1/WO51MacOSXDevUpdate1.pkg.tar

   Stuffit Expander should automatically expand the .tar file, leaving `WO51MacOSXDevUpdate1.pkg`.

2. Double-click `WO51MacOSXDevUpdate1.pkg`.

   The Authorization panel opens.

3. Only an administrator can install the update. Click the lock icon at the bottom left of the panel to authenticate for administrative access.
4. Click OK to proceed.

   The Introduction panel appears.

5. Click Continue.

   The Software License Agreement appears.

6. Read the software license agreement, then click Continue.

7. Click Agree to agree to the license and continue the installation.

8. Select the volume containing Mac OS X and WebObjects 5.1 Developer, then click Continue.

9. Make sure that there are no WebObjects or EOF applications running.

10. Click Install to proceed with installation.

    The Installer window displays information about the progress of the installation, which may take several minutes.

11. Restart your computer.

Manually Installing WebObjects 5.1.1 Deployment on Mac OS X Server 10.1.3

These instructions are for manually downloading and installing WebObjects 5.1.1 Deployment. If you are installing using Software Update, see the section titled "**WebObjects 5.1.1 for Mac OS X (Server) 10.1.3**", above.

Note: WebObjects 5.1.1 Deployment requires Mac OS X Server 10.1.3 or later as well as the 10.1.3 Server Update and the Java 1.3.1 Update 1. If you have not yet updated to the correct version of Mac OS X Server and Java, you must do so before installing WebObjects 5.1.1. The Mac OS X Server 10.1.3 image is available on the Apple web site.

1. Download `WO51MacOSXDepUpdate1.pkg.tar`, the update package for Mac OS X Server 10.1.

    The update is available from:

    http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/5.1/WO51MacOSXDepUpdate1.pkg.tar

    Stuffit Expander should automatically expand the .tar file, leaving `WO51MacOSXDepUpdate1.pkg`.

2. Double-click on `WO51MacOSXDepUpdate1.pkg`.

    The Authorization panel opens.

3. Only an administrator can install the update. Click the lock icon at the bottom left of the panel to authenticate for administrative access.

4. Click OK to proceed.

    The Introduction panel appears.

5. Click Continue.

    The Software License Agreement appears.

6. Read the software license agreement, then click Continue.

7. Click Agree to agree to the license and continue the installation.

8. Select the volume that contains Mac OS X Server and WebObjects 5.1 Deployment, then click Continue.

9. Make sure that there are no WebObjects or EOF applications running.

10. Click the Install button to proceed with installation. The Installer window displays information about the progress of the installation, which may take several minutes.

11. Restart your computer.

Installing WebObjects 5.1.1 on Windows 2000

Notes:

- During the installation, if you see panels indicating that certain files being replaced by the update are "locked", choose the Reboot button to continue the installation. The files are replaced upon restarting.
- This update cannot be uninstalled alone. Once you have upgraded to WebObjects 5.1.1 you cannot revert to WebObjects 5.1. However, the entire WebObjects 5.1.1 installation can be uninstalled using the "Add/Remove Programs" control panel.

1. Download `WO51WinUpdate1.exe`, the self-extracting update installer for Windows 2000.

    The update is available from:

    http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/5.1/WO51WinUpdate1.exe

2. Log in as a user with Administrator privileges.

Make sure that there are no WebObjects or EOF applications running.

3. Double-click **WO51WinUpdate1.exe** to start the installation process.

An informational screen about this update appears.

4. After reading the screen, click "Next" to continue.

The license agreement for this update will appear.

5. To agree to the license and continue the installation, click "Yes".

6. Copy the updated WODocument root in **$NEXT_ROOT/Library/WeObjects/WODocumentRoot/WebObjects** to your web server's document root.

The update will be installed on your system and you will be asked if you want to restart.

7. Select "Yes, I want to restart my computer now" to restart.

The WinZip self-extractor automatically quits and removes its temporary files in about 20 seconds.

Installing WebObjects 5.1.1 on Solaris

1. Download **WO51SolarisUpdate1.TAR.Z**, the update installer for Solaris, and download the update installation script, **patcher.sh**.

The updates are available from:

WO51SolarisUpdate1.TAR.Z

http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/5.1/WO51SolarisUpdate1.TAR.Z

patcher.sh

http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/scripts/patcher.sh

After you have downloaded the files, the **patcher.sh** script needs its executable bit set. At the command prompt enter:

```
chmod 511 patcher.sh
```

2. Log in as root.

3. Make sure that there are no WebObjects or EOF applications running, including Monitor.

4. If a web server is running on the computer on which you are installing the update, stop it.

5. Stop WebObjects services (wotaskd and woservice) using the WOServices script.

At the command prompt enter:

```
cd $NEXT_ROOT/Library/WebObjects/Executables
```

```
./WOServices stop
```

These services are restarted when you restart after installing the update.

6. To Install the update, cd to the directory containing the update and the **patcher.sh** installation script.

7. At the command prompt enter:

```
patcher.sh -install WO51SolarisUpdate1.TAR.Z
```

For more information on using **patcher.sh**, at the command prompt enter:

```
patcher.sh -help
```

8. Copy the updated WODocument root to your web server's document root.

```
cp -r $NEXT_ROOT/Library/WeObjects/WODocumentRoot/WebObjectsÂ <webserver doc root>/WebObjects
```

9. Restart your computer.

Corrected in WebObjects 5.1.1

NSTimeZone : timeZoneFromSecondsFromGMT() returns no time zone even when value is valid

Apple Reference 2814979

ISSUE:

NSTimeZone.timeZoneFromSecondsFromGMT() returned null when the offset was a valid value for an apolitical time zone.

RESOLUTION:

If the seconds offset from GMT corresponds to a whole hour between 12 and -12 inclusive, this method reuses an existing, well-known, apolitical NSTimeZone object for that offset. Only whole hour offsets should by passed to this method in WebObjects 5.1.1.

NSPathUtilities.stringByDeletingLastPathComponent() returns incorrect result on Windows

Apple Reference 2822553

ISSUE:

On Windows, NSPathUtilities.stringByDeletingLastPathComponent() returns an incorrect result if the root directory is specified. For example, an input of "C:/" incorrectly returns "C:" rather than "C:/".

RESOLUTION:

This problem has been corrected.

NSTimestamp.microsecondOfSecond is off by a factor of 1000

Apple Reference 2837997

ISSUE:

In WebObjects 5.1, NSTimestamp.microsecondOfSecond() actually returns milliseconds.

RESOLUTION:

This problem has been corrected.

NSTimestampFormatter does not format NSTimestamp in the local time zone

Apple Reference 2838080

ISSUE:

In WebObjects 5.1, NSTimestampFormatter does not format NSTimestamp in the local time zone.

RESOLUTION:

NSTImestampFormatter now defaults to the local time zone.

WOEventDisplay gives an error screen when logging is on

Apple Reference 2844727

ISSUE:

Viewing the event display page can result in a ClassCastException.

RESOLUTION:

This problem has been corrected.

NSTimestamp does not have SUID for serialization

Apple Reference 2847504

ISSUE:

WebObjects 5.1 cannot read NSTimestamps serialized in WebObjects 5.0.

RESOLUTION:

The serialID in WebObjects 5.1.1 has been changed to match the serialID in WebObjects 5.0. In WebObjects 5.1.1, NSTimestamp will read WebObjects 5.0/5.1.1 serialized Timestamps and write WebObjects 5.1.1 NSTimestamps.

NSTimestamp data that was serialized using WebObjects 5.1 cannot be deserialized using WebObjects 5.1.1. However, data can be migrated using NSTimestampFormatter. A WebObjects 5.1 tool can use NSTimestampFormatter to convert NSTimestamps to Strings. Then a WebObjects 5.1.1 tool can use NSTimestampFormatter to convert the Strings back to NSTimestamps.

NSTimestampFormatter.parseObject creates incorrect timestamp

Apple Reference 2849628

ISSUE:

NSTimestampFormatter.parseObject creates an incorrect timestamp when the string being parsed does not use GMT for the time zone.

RESOLUTION:

This problem has been corrected. Please review any subclasses of NSTimestampFormatter you may have used to work around this problem in your WebObjects 5.1 applications.

NSTimeZone.localTimeZone() raises

Apple Reference 2849630

ISSUE:

Using NSTimeZone.localTimeZone() with NSTimestampFormatter raises an exception.

RESOLUTION:

This problem has been corrected.

backtracking page cache not working properly

Apple Reference 2849640

ISSUE:

Backtracking in a browser and repeating a request or reloading a previously generated page incorrectly causes the request/response loop to execute rather than simply returning the cached page. (See WOApplication.setPageRefreshOnBacktrackEnabled().)

RESOLUTION:

The page cache now functions properly. Additionally, a request's form values (if any) are now considered when determining whether to return a cached page. If the user backtracks and repeats a request with modified form values, the request/response loop will execute. However, with the current implementation, the responses for both sets of form values remain in the cache. If the user backtracks a second time and makes another request with the original form values, the request/response loop will not execute and the cached page will be returned.

The documentation for WOApplication.setPageRefreshOnBacktrackEnabled() is incorrect on one point. The documentation states "By default, this attribute is set to false." The default in WebObjects 5.1 is true.

WO5.1 Win2K Cannot Launch Apps

Apple Reference 2849676

ISSUE:

Launching WebObjects 5.1 applications on Windows 2000 with European localization can fail with an error similar to:

```
Configuring launch environment for HelloWorld...

443 was unexpected at this time.
```

RESOLUTION:

This is a problem in the application launcher .cmd file generated when the application is built. The WebObjects build tools have been modified to produce correct .cmd files. However, existing .cmd files must be regenerated to incorporate this change. If you are experiencing this problem you must rebuild your application after installing WebObjects 5.1.1.

NullPointerException in WO5.1 with many to many relationships

Apple Reference 2850322

ISSUE:

In WebObjects 5.1, if an EOModel defines a many to many relationship that is only modeled in one direction, an error occurs attempting to access the entity which does not have the relationship modeled.

RESOLUTION:

This problem has been corrected.

An optimistic locking failure can cause subsequent fetch failures

Apple Reference 2852342

ISSUE:

An exception can leave the JDBCChannel in a bad state. Thereafter, a SELECT query can be incorrectly sent via a JDBC executeUpdate() call, raising a JDBCAdaptorException.

RESOLUTION:

This problem has been corrected.

Opening Components in WOBuilder

Apple Reference 2863520

ISSUE:

WOBuilder sometimes fails to open a component when double clicking on a .wo in ProjectBuilder. WOBuilder displays the message "Failed to open component".

RESOLUTION:

This problem has been corrected.

EOModeler fails to overwrite existing *.java file

Apple Reference 2880006

ISSUE:

When generating java files for an entity, EOModeler fails to overwrite previously generated files.

RESOLUTION:

This has been fixed for WebObjects on Mac OS X. In addition, EOModeler now includes an option to merge any differences using FileMerge.

AirPort for Mac OS 9: Can‘t Update Base Station From Setup Assistant

After updating to AirPort 2.0.2 in Mac OS 9, you cannot update the AirPort Base Station from the AirPort Setup Assistant.
This article has been archived and is no longer updated by Apple.

Symptom

When using AirPort Setup Assistant after an update to AirPort 2.0.2 software, you see a message that "Your Base Station needs to be updated." When you click the Update button, you are returned to to the password entry dialog. The Assistant is stuck in a loop at this point, and you must quit it without completing the setup.

Note: This does not affect AirPort 2.0.2 software for Mac OS X.

Solution

Locate your copy of AirPort Admin Utility, and use it to connect to the base station. You will be prompted to update the base station then.

Note: The location of AirPort Admin Utility may vary, depending on the history of your system. If you don't know where it is, try using Sherlock to find it.

Mac OS X: PDF Files Require User Password for Print Security

When adding document security features to an Adobe portable document format (PDF) document, always assign a user password to the document to ensure the effectiveness of the security.
This article has been archived and is no longer updated by Apple.

Symptom

PDF documents designed to have additional security features, such as not allowing printing, but without a user password assigned to them are not necessarily secure.

Solution

Add a user password to all secure documents.

The only way to ensure a PDF document with security features is always secure and cannot be modified is to add a user password. Any PDF document without a user password should not be used in situations where the security features need to be enforced.

Mac OS X: About the "Install Mac OS 9 Drivers" Option in Disk Utility

Learn about the "Install Mac OS 9 Drivers" option in the Mac OS X Disk Utility.
This article has been archived and is no longer updated by Apple.
When formatting a hard disk using the Disk Utility application, there may be an option to "Install Mac OS 9 Drivers" under the Erase panel. **Note**: Disk Utility offers this option if the computer can start from Mac OS 9. If you don't see it in Disk Utility, your computer may start from Mac OS X only.

If you do not select this option when formatting a hard drive, the disk may not appear when the computer starts up from any version of the Mac OS other than Mac OS X. You should only deselect this option if the computer or hard disk is to be used exclusively with Mac OS X. Not selecting this option saves a small amount of drive space.

This option does not affect the availability or use of a disk with Classic in Mac OS X.

WebObjects 5.1.3: Update Overview

This document contains an overview and download information for Apple's WebObjects 5.1.3 update. Apple does not recommend that all customers install this update. Only customers who are affected by one or more of the issues described below should install this update.

The **WebObjects Current Patch List**, document 70037, contains information on all available patches and updates for all versions of WebObjects. Read this document if you're not sure which update you need on your system.

Important: The information in Software Update which states this update is recommended for all WebObjects Developer users is incorrect. Follow the recommendations in this document about who should install this update.

This article has been archived and is no longer updated by Apple.
WebObjects 5.1.3 includes updated versions of several WebObjects class and jar files. Some WebObjects project types make copies of these files when the project is built. As a result, some projects may need to be rebuilt to take advantage of the issues addressed in the update. For example, when a JSP/Servlet war archive is created, several jars are copied into the war file. At least one jar (WOJSPServlet_client.jar, from the WOJSPServlet.framework) is always copied, and additional framework jars may be copied into the war as well, depending on the project. After installing WebObjects 5.1.3, either the application must be rebuilt (recreating the war archive), or the war archive must be manually updated, using the jar tool.

This update includes modified WebObjects client-side Java classes and jars. On Mac OS X Server and Microsoft Windows the update installer automatically places the modified classes and jars in your web server's document root directory. On Sun Solaris, the update installer places the modified classes in the WebObjects installation (in `$NEXT_ROOT/Library/WebObjects/WODocumentRoot/WebObjects`) but does not copy them to your web server's document root directory. To use the new files, you must install them in the correct location for the web server being used.

WebObjects 5.1.3 for Mac OS X (Server) 10.1.4

Important: There are two mutually exclusive updates for this platform. If you have WebObjects 5.1 Developer installed on Mac OS X 10.1.4, you need the WebObjects 5.1.3 Developer update. If you have WebObjects 5.1 Deployment installed on Mac OS X Server 10.1.4, you need the WebObjects 5.1.3 Deployment update. You do not need both on any system.

This update is available through the Software Update feature of Mac OS X. If you use this method, only the proper update for the software which you have installed on your system is visible and available for download. If you prefer to download and install the package manually, follow the instructions below.

Note: WebObjects 5.1.3 Deployment requires:

- Mac OS X Server 10.1.4 or later
- **Mac OS X 10.1.4 Server Update**
- **April 2002 Security Update**
- **Java 1.3.1 Update 1**

WebObjects 5.1.3 Developer requires:

- Mac OS X 10.1.4 or later
- December 2001 Mac OS X 10.1 Developer Tools
- **April 2002 Security Update**
- **Java 1.3.1 Update 1**

If you have not yet updated to the correct version of Mac OS X Server, Developer Tools, and Java, you must do so before installing WebObjects 5.1.3. The Mac OS X 10.1.4 and December 2001 Mac OS X 10.1 Developer Tools images are available on the Apple Developer's web site at: <http://www.apple.com/developer/>.

If you are creating a new Mac OS X WebObjects 5.1 development system, you should install the software in the following order:

1. Mac OS X 10.1.4
2. December 2001 Mac OS X 10.1 Developer Tools
3. Java 1.3.1 Update 1
4. April 2002 Security Update
5. WebObjects 5.1 Developer
6. WebObjects 5.1.3 Developer

Manually Installing WebObjects 5.1.3 Developer on Mac OS X 10.1.4

These instructions are for manually downloading and installing WebObjects 5.1.3 Developer. If you are installing using Software Update, see WebObjects 5.1.3 for Mac OS X Server 10.1.4, above.

Note: WebObjects 5.1.3 Developer requires:

- Mac OS X 10.1.4 or later
- December 2001 Mac OS X 10.1 Developer Tools
- **April 2002 Security Update**
- **Java 1.3.1 Update 1**

If you have not yet updated to the correct version of Mac OS X, Developer Tools, and Java, you must do so before installing WebObjects 5.1.3. The Mac OS X 10.1.4 and

December 2001 Mac OS X 10.1 Developer Tools images are available on the Apple Developer's web site at: <http://www.apple.com/developer/>.

1. Download **`WO51MacOSXDevUpdate3.pkg.tar`**, the update package for Mac OS X 10.1.

The update is available from:

http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/5.1/WO51MacOSXDevUpdate3.pkg.tar

Stuffit Expander should automatically expand the .tar file, leaving **`WO51MacOSXDevUpdate3.pkg`**.

2. Double-click **`WO51MacOSXDevUpdate3.pkg`**.

The Authorization panel opens.

3. Only an administrator can install the update. Click the lock icon at the bottom left of the panel to authenticate for administrative access.

4. Click OK to proceed.

The Introduction panel appears.

5. Click Continue.

The Software License Agreement appears.

6. Read the software license agreement, then click Continue.

7. Click Agree to agree to the license and continue the installation.

8. Select the volume containing Mac OS X and WebObjects 5.1 Developer, then click Continue.

9. Make sure that there are no WebObjects or EOF applications running.

10. Click Install to proceed with installation.

The Installer window displays information about the progress of the installation, which may take several minutes.

11. Restart your computer.

Manually Installing WebObjects 5.1.3 Deployment on Mac OS X Server 10.1.4

These instructions are for manually downloading and installing WebObjects 5.1.3 Deployment. If you are installing using Software Update, see WebObjects 5.1.3 for Mac OS X Server 10.1.4, above.

Note: WebObjects 5.1.3 Deployment requires:

- Mac OS X Server 10.1.4 or later
- **Mac OS X 10.1.4 Server Update**
- **Java 1.3.1 Update 1**

If you have not yet updated to the correct version of Mac OS X Server and Java, you must do so before installing WebObjects 5.1.3. The Mac OS X Server 10.1.4 image is available on the Apple web site.

1. Download **`WO51MacOSXDepUpdate3.pkg.tar`**, the update package for Mac OS X Server 10.1.

The update is available from:

http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/5.1/WO51MacOSXDepUpdate3.pkg.tar

Stuffit Expander should automatically expand the .tar file, leaving **`WO51MacOSXDepUpdate3.pkg`**.

2. Double-click **`WO51MacOSXDepUpdate3.pkg`**.
The Authorization panel opens.

3. Only an administrator can install the update. Click the lock icon at the bottom left of the panel to authenticate for administrative access.

4. Click OK to proceed.

The Introduction panel appears.

5. Click Continue.

The Software License Agreement appears.

6. Read the software license agreement, then click Continue.

7. Click Agree to agree to the license and continue the installation.

8. Select the volume containing Mac OS X and WebObjects 5.1 Developer, then click Continue.

9. Make sure that there are no WebObjects or EOF applications running.

10. Click Install to proceed with installation.

The Installer window displays information about the progress of the installation, which may take several minutes.

11. Restart your computer.

Installing WebObjects 5.1.3 on Windows 2000

Notes:

- During the installation, if you see panels indicating that certain files being replaced by the update are "locked", click Reboot to continue the installation. The files will be replaced upon restarting.
- This update cannot be uninstalled alone. Once you have upgraded to WebObjects 5.1.3 you cannot revert to WebObjects 5.1. However, the entire WebObjects 5.1.3 installation can be uninstalled using the Add/Remove Programs control panel.
- The WebObjects 5.1.3 update includes updated reference documentation in the standard JavaDoc format for the changes to the NSTimeZone, NSTimestamp, and NSTimestampFormatter classes. The files are placed in **`$NEXT_ROOT\\Developer\\Documentation\\WebObjects\\Reference`**.

1. Download **`WO51WinUpdate3.exe`**, the self-extracting update installer for Windows 2000.

The update is available from:

http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/5.1/WO51WinUpdate3.exe

2. Log in as a user with Administrator privileges.

3. Make sure that there are no WebObjects or EOF applications running.

4. Double-click on the update installer, **`WO51WinUpdate3.exe`**, to start the installation process.

A screen appears with some information about this update.

5. After you have read the information screen, click Next to continue.

The license agreement for this update appears.

6. To agree to the license and continue the installation, click Yes.

The update will be installed on your system and you will be asked if you want to restart.

7. Select Yes, I want to restart my computer now to restart Windows.

The WinZip self-extractor automatically quits and removes its temporary files in about 20 seconds.

Installing WebObjects 5.1.3 on Solaris

1. Download **`WO51SolarisUpdate3.TAR.Z`**, the update installer for Solaris.

You will also need to download the update installation script, **`patcher.sh`**.

The update is available from:

http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/webobjects/patches/5.1/WO51SolarisUpdate3.TAR.Z

The installation script is available at:

http://download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/MultiCountry/Enterprise/scripts/patcher.sh

After you have downloaded the files, the patcher.sh script needs its executable bit set. At the command prompt enter:

```
chmod 511 patcher.sh
```

2. Log in as root.

3. Make sure that there are no WebObjects or EOF applications running, including Monitor.

4. If a web server is running on the computer on which you are installing the update, stop it.

5. Stop WebObjects services (**`wotaskd`** and **`woservice`**) using the WOServices script. At the command prompt enter:

```
cd $NEXT_ROOT/Library/WebObjects/Executables
./WOServices stop
```

These services will restart when you restart the computer after installing the update.

6. To Install the update, cd to the directory containing the update and the patcher.sh installation script. Then at the command prompt enter:

```
patcher.sh -install WO51SolarisUpdate3.TAR.Z
```

For more information on using patcher.sh, at the command prompt enter:

```
patcher.sh -help
```

7. Copy the updated WODocument root to your web server's document root.

```
cp -r $NEXT_ROOT/Library/WebObjects/WODocumentRoot/WebObjects <webserver doc root>/WebObjects
```

8. restart your computer.

Corrected in WebObjects 5.1.3

Unable to use redirects or return error codes for servlets

Apple Reference 2858300

ISSUE:

Status codes weren't being set properly for servlet applications.

RESOLUTION:

This issue has been corrected.

Deadlock with EOSharedEditingContext

Apple Reference 2861512

ISSUE:

A race condition can cause an application which uses EOSharedEditingContext to deadlock. This deadlock can occur when the shared editing context receives a change notification concurrent with access from another thread. The deadlock can be identified by threads being blocked with the following appearing in the backtrace:

```
java.lang.Object.wait (Native Method)
java.lang.Object.wait (Object.java:420)
com.webobjects.foundation.NSMultiReaderLock$ConditionLock.await (NSMultiReaderLock.java:503)
...
```

RESOLUTION:

The deadlock was caused by two lock primitives being locked in different order by different threads. For WebObjects 5.1.3 the deadlock has been addressed by merging the underlying locks and using a single locking primitive. With this change, holding a read or write lock on the shared editing context will block other threads in that application instance from performing EOF operations, and vice versa. Additionally, in WebObjects 5.1.3 multiple shared editing contexts use the same underlying lock object.

Note that in most cases it is not necessary to explicitly lock a shared editing context using `lockForReading()` or `lockForWriting()`. One case where it is necessary to lock the shared editing context in WebObjects 5.1.3 is if either of the EOSharedEditingContext methods `objectsByEntityName()` or `objectsByEntityNameAndFetchSpecificationName()` are used. In WebObjects 5.1.3 both of these methods return references to mutable collections which could change if the shared editing context is not locked. Customers using these methods should hold a read lock on the shared editing context while operating on these collections. However, applications which must lock the shared editing context should minimize the scope of the lock to avoid blocking other threads from using EOF. One strategy might be to hold a lock only long enough to copy the needed collection objects, then operate on the copy.

It is expected that the next release of WebObjects will include a different resolution for this problem which provides more concurrency and removes the requirement to explicitly lock the shared editing context. This issue is being tracked as Apple Reference 2948731 for the next WebObjects release. When the next version of WebObjects is released, refer to Apple Reference 2948731 in the release notes for more information.

Corrected in WebObjects 5.1.2

NPE with a compound primary key whose value types are other than 'i'

Apple Reference 2838002

ISSUE:

In some circumstances, using a compound primary key with a value type other than 'i' would result in EOF replacing one component of the key with null.

RESOLUTION:

This issue has been corrected.

WOResourceManager generating incorrect URLs when WOApp accessed via web server

Apple Reference 2838073

ISSUE:

WOResourceManager generates incorrect URLs when an app started in ProjectBuilder is accessed via a web server. This can cause images to fail to load.

RESOLUTION:

This issue has been corrected. It only occurs if the app detects that its project is currently open in ProjectBuilder when the instance is launched. This issue does not affect deployed apps.

EOModeler fails to launch FileMerge when merging .java files (Windows)

Apple Reference 2851049

ISSUE:

EOModeler fails to merge .java files in FileMerge because FileMerge does not launch. Also, FileMerge fails to show differences when the path to the eomodel has a directory with a space in its name. This issue is specific to the Windows platform.

RESOLUTION:

This issue has been corrected.

EOModeler fails to overwrite existing .java file (Windows)

Apple Reference 2851267

ISSUE:

EOModeler fails to overwrite previously generated files when generating java files for an entity. This issue is specific to the Windows platform.

RESOLUTION:

This issue has been corrected. In addition, EOModeler now includes an option to merge any differences using FileMerge.

In-memory qualification returns too many objects

Apple Reference 2852347

ISSUE:

Qualification of in-memory objects returns objects with null values in addition to the desired objects.

RESOLUTION:

For EOQualifier on in-memory objects, the operators <, >, <=, and >= always return false if either operand is null. However, = and != treat null values as equal to null and return the appropriate result. EOSortingOrder treats null as negative infinity.

NPE in EOClassDescription when propagating deletes

Apple Reference 2856718

ISSUE:

If a to-many relationship was set to null, EOClassDescription throws a null pointer exception when propagating deletes through the to-many relationship.

RESOLUTION:

This issue has been corrected.

The command "opendiff" does not launch FileMerge (Windows)

Apple Reference 2869320

ISSUE:

On Windows the "opendiff" command will not launch FileMerge.

RESOLUTION:

This issue has been corrected.

"unable to increment snapshot count for object" exception in fetch

Apple Reference 2869648

ISSUE:

`EOEditingContext.objectsWithFetchSpecification()` fails sometimes with an exception similar to:
java.lang.IllegalStateException: incrementSnapshotCountForGlobalID: com.webobjects.eoaccess.EODatabase - unable to increment snapshot count for object with global ID xxx - no snapshot exists.

RESOLUTION:

WebObjects 5.1.2 corrects one possible way this exception can occur. However, the issue remains under investigation.

NSTimeZone.setDefault() should accept java.util.TimeZone

Apple Reference 2881499

ISSUE:

NSTimeZone.setDefault() throws an IllegalArgumentException when passed a java.util.TimeZone.

RESOLUTION:

NSTimeZone.setDefault() has been modified to accept a java.util.TimeZone.

NSTimeZones hash to zero

Apple Reference 2894077

ISSUE:

All NSTimeZones hash to zero.

RESOLUTION:

This issue has been corrected.

NSTimestamp() creates an incorrect timestamp

Apple Reference 2894102

ISSUE:

If an NSTimestamp is created using NSTimestamp(int year, int month, int date, int hour, int minute, int second, TimeZone tz) with values which refer to a time before the reference date, the created NSTimestamp is off by one second.

RESOLUTION:

This issue has been corrected.

NSTimeZone.getGMT() should be public

Apple Reference 2894146

ISSUE:

NSTimeZone.getGMT() should be public.

RESOLUTION:

NSTimeZone.getGMT() is now public and returns an NSTimeZone corresponding to Etc/GMT (GMT) offset 0.

NSTimestamp throws when using custom Java time zone

Apple Reference 2894493

ISSUE:

NSTimestamp throws an exception when using a custom Java time zone like GMT+06:00.

RESOLUTION:

NSTimeZone now supports time zones of the form GMT[+|-]hh:mm. They can be generated using NSTimeZone.timeZoneForSecondsFromGMT(int secondsOffsetFromGMT).

NSTimestamp(System.currentTimeMillis(), 999999999) throws an exception

Apple Reference 2894495

ISSUE:

NSTimestamp(System.currentTimeMillis(), 999999999) throws an exception. This method should only throw an exception when the nanos argument is greater than 999999999.

RESOLUTION:

This issue has been corrected.

NSTImeZone.setDefault() to NSLocalTimeZone should throw

Apple Reference 2894496

ISSUE:

It should be invalid to set the default time zone to NSLocalTimeZone.

RESOLUTION:

NSTimeZone.setDefault() now throws an IllegalArgumentException when passed an NSLocalTimeZone.

NPE if you call hashCode() on an NSLocalTimeZone object

Apple Reference 2894498

ISSUE:

Calling hashCode() on an NSLocalTimeZone object results in a null pointer exception.

RESOLUTION:

NSLocalTimeZone.hashCode() now returns the hash code of defaultTimeZone().

NSTimestampFormatter.parseObject() cannot parse arbitrary GMT timezone strings

Apple Reference 2894500

ISSUE:

NSTimestampFormatter.parseObject() cannot parse arbitrary GMT timezone strings like "GMT+12:15".

RESOLUTION:

This issue has been corrected.

Some abbreviations don't have corresponding time zone.

Apple Reference 2894502

ISSUE:

Some abbreviations don't have a corresponding NSTimeZone.

RESOLUTION:

This issue has been corrected.

timeZoneForSecondsFromGMT doesn't deal with extra seconds

Apple Reference 2894503

ISSUE:

Any extra seconds that were not part of whole hours and minutes were included in the offset of the apolitical time zone created.

RESOLUTION:

Extra seconds are now rounded to the nearest minute. For example:

NSTimeZone.timeZoneForSecondsFromGMT(-30) = GMT-00:01 () offset -60
NSTimeZone.timeZoneForSecondsFromGMT(-29) = GMT-00:00 () offset 0
NSTimeZone.timeZoneForSecondsFromGMT(30) = GMT+00:01 () offset 60
NSTimeZone.timeZoneForSecondsFromGMT(29) = GMT+00:00 () offset 0

NSTimestampFormatter.parseObjectInUTC can fail

Apple Reference 2894504

ISSUE:

NSTimestampFormatter.parseObjectInUTC() fails when the parse position is not at the beginning of the string.

RESOLUTION:

This issue has been corrected.

Apolitical time zones always return a zero offset from GMT

Apple Reference 2894505

ISSUE:

NSTimeZone.getRawOffset() is returning zero for apolitical time zones like "Etc/GMT+9".

RESOLUTION:

Apolitical time zones now return their offset from GMT. Geopolitical time zones will return zero, as many do not have one generic offset.

NSTimeZone.getAvailableIDs() contains "Factory"

Apple Reference 2894507

ISSUE:

NSTimeZone.getAvailableIDs() returns an incorrect entry "Factory".

RESOLUTION:

This issue has been corrected.

Corrected in WebObjects 5.1.1

NSTimeZone : timeZoneFromSecondsFromGMT() returns no time zone even when value is valid

Apple Reference 2814979

ISSUE:

NSTimeZone.timeZoneFromSecondsFromGMT() returned null when the offset was a valid value for an apolitical time zone.

RESOLUTION:

If the seconds offset from GMT corresponds to a whole hour between 12 and -12 inclusive, this method reuses an existing, well-known, apolitical NSTimeZone object for that offset. Only whole hour offsets should by passed to this method in WebObjects 5.1.1.

NSPathUtilities.stringByDeletingLastPathComponent() returns incorrect result on Windows

Apple Reference 2822553

ISSUE:

On Windows, NSPathUtilities.stringByDeletingLastPathComponent() returns an incorrect result if the root directory is specified. For example, an input of "C:/" incorrectly returns "C:" rather than "C:/".

RESOLUTION:

This problem has been corrected.

NSTimestamp.microsecondOfSecond is off by a factor of 1000

Apple Reference 2837997

ISSUE:

In WebObjects 5.1, NSTimestamp.microsecondOfSecond() actually returns milliseconds.

RESOLUTION:

This problem has been corrected.

NSTimestampFormatter does not format NSTimestamp in the local time zone

Apple Reference 2838080

ISSUE:

In WebObjects 5.1, NSTimestampFormatter does not format NSTimestamp in the local time zone.

RESOLUTION:

NSTImestampFormatter now defaults to the local time zone.

WOEventDisplay gives an error screen when logging is on

Apple Reference 2844727

ISSUE:

Viewing the event display page can result in a ClassCastException.

RESOLUTION:

This problem has been corrected.

NSTimestamp does not have SUID for serialization

Apple Reference 2847504

ISSUE:

WebObjects 5.1 cannot read NSTimestamps serialized in WebObjects 5.0.

RESOLUTION:

The serialID in WebObjects 5.1.1 has been changed to match the serialID in WebObjects 5.0. In WebObjects 5.1.1, NSTimestamp will read WebObjects 5.0/5.1.1 serialized Timestamps and write WebObjects 5.1.1 NSTimestamps.

NSTimestamp data that was serialized using WebObjects 5.1 cannot be deserialized using WebObjects 5.1.1. However, data can be migrated using NSTimestampFormatter. A WebObjects 5.1 tool can use NSTimestampFormatter to convert NSTimestamps to Strings. Then a WebObjects 5.1.1 tool can use NSTimestampFormatter to convert the Strings back to NSTimestamps.

NSTimestampFormatter.parseObject creates incorrect timestamp

Apple Reference 2849628

ISSUE:

NSTimestampFormatter.parseObject creates an incorrect timestamp when the string being parsed does not use GMT for the time zone.

RESOLUTION:

This problem has been corrected. Please review any subclasses of NSTimestampFormatter you may have used to work around this problem in your WebObjects 5.1 applications.

NSTimeZone.localTimeZone() raises

Apple Reference 2849630

ISSUE:

Using NSTimeZone.localTimeZone() with NSTimestampFormatter raises an exception.

RESOLUTION:

This problem has been corrected.

backtracking page cache not working properly

Apple Reference 2849640

ISSUE:

Backtracking in a browser and repeating a request or reloading a previously generated page incorrectly causes the request/response loop to execute rather than simply returning the cached page. (See WOApplication.setPageRefreshOnBacktrackEnabled().)

RESOLUTION:

The page cache now functions properly. Additionally, a request's form values (if any) are now considered when determining whether to return a cached page. If the user backtracks and repeats a request with modified form values, the request/response loop will execute. However, with the current implementation, the responses for both sets of form values remain in the cache. If the user backtracks a second time and makes another request with the original form values, the request/response loop will not execute and the cached page will be returned.

The documentation for WOApplication.setPageRefreshOnBacktrackEnabled() is incorrect on one point. The documentation states "By default, this attribute is set to false." The default in WebObjects 5.1 is true.

WO5.1 Win2K Cannot Launch Apps

Apple Reference 2849676

ISSUE:

Launching WebObjects 5.1 applications on Windows 2000 with European localization can fail with an error similar to:

```
Configuring launch environment for HelloWorld...

443 was unexpected at this time.
```

RESOLUTION:

This is a problem in the application launcher .cmd file generated when the application is built. The WebObjects build tools have been modified to produce correct .cmd files. However, existing .cmd files must be regenerated to incorporate this change. If you are experiencing this problem you must rebuild your application after installing WebObjects 5.1.1.

NullPointerException in WO5.1 with many to many relationships

Apple Reference 2850322

ISSUE:

In WebObjects 5.1, if an EOModel defines a many to many relationship that is only modeled in one direction, an error occurs attempting to access the entity which does not have the relationship modeled.

RESOLUTION:

This problem has been corrected.

An optimistic locking failure can cause subsequent fetch failures

Apple Reference 2852342

ISSUE:

An exception can leave the JDBCChannel in a bad state. Thereafter, a SELECT query can be incorrectly sent via a JDBC executeUpdate() call, raising a JDBCAdaptorException.

RESOLUTION:

This problem has been corrected.

Opening Components in WOBuilder

Apple Reference 2863520

ISSUE:

WOBuilder sometimes fails to open a component when double clicking on a .wo in ProjectBuilder. WOBuilder displays the message "Failed to open component".

RESOLUTION:

This problem has been corrected.

EOModeler fails to overwrite existing *.java file

Apple Reference 2880006

ISSUE:

When generating java files for an entity, EOModeler fails to overwrite previously generated files.

RESOLUTION:

This has been fixed for WebObjects on Mac OS X. In addition, EOModeler now includes an option to merge any differences using FileMerge.

Published Date: Feb 19, 2012

Macintosh Server G4 (QuickSilver 2002): Only Ten Users Can Connect

Some Macintosh Server G4 (QuickSilver 2002) servers came with ten-user licenses instead of unlimited licenses.

This article has been archived and is no longer updated by Apple.

Symptom

Only ten users can connect simultaneously to a Macintosh Server G4 (QuickSilver 2002) over SMB or AFP.

Solution

Some Macintosh Server G4 (QuickSilver 2002) servers came with incorrectly printed software serial numbers. The sticker on the Mac OS X Server CD sleeve indicates the software serial number is an unlimited license, but it is actually a 10-client license.

If you experience this symptom, you can have a replacement serial number issued to you at the Mac OS X Server Serial Number Exchange Web site (http://depot.info.apple.com/macosxserversn/)

Published Date: Feb 20, 2012

Mac OS 9: Unable to Print With Extensis MenuFonts and Adobe Type Manager (ATM) Installed

Extensis MenuFonts may prevent the computer from printing if Adobe Type Manager (ATM) is also installed.
This article has been archived and is no longer updated by Apple.

Symptom

When you print, an alert box with one of these messages appears:

- No printer has been selected in the Chooser. Reselecting the printer in the Chooser does not resolve the issue.
- Error type -60
- Error type -23

Solution

Open the Control Panels folder to see if Suitcase 9 MenuFonts and Adobe Type Manager (ATM) are both installed. If so, there are two solutions.

- Use the Extensions Manager to disable the ~Suitcase 9 MenuFontsTM control panel, then restart the computer.
- Rename the ~Suitcase 9 MenuFontsTM control panel to include a space between the tilde and S characters.
  The resulting name will be: ~ Suitcase 9 MenuFontsTM

More information about this issue is available from Extensis' Web site:

http://www.extensis.com/support/oldproducts/suitcase9macfaq.html

Mac OS 9: How to Troubleshoot Software Update Control Panel

This document describes methods for troubleshooting issues related to the Software Update control panel.

This article has been archived and is no longer updated by Apple.

If you are not able to use the Software Update feature of Mac OS 9, try one or more of the following troubleshooting steps.

Install Software Update version 1.2

If you are not able to use the auto-update mechanism, check to see if you are using Software Update version 1.2 or later. Open the Software Update control panel and choose About Software Update from the Apple menu to confirm the version of Software Update installed. If version 1.2 or later is not installed, download and install Software Update 1.2 or later, which is available from Apple Software Downloads (http://www.apple.com/swupdates/).

Error message "Not able to run"

If the Software Update control panel reports that it is "not able to run", make sure that the following security extensions are installed in the Extensions folder of your System Folder. If these items are missing, you may need to re-install your system software:

- Security Cert Module
- Security Library
- Security Manager
- Security Policy Module
- Security Storage Module

Unable to connect to the Internet

If you see a message that the Software Update control panel is "not able to connect to the Internet", use a web browser to connect to the Apple web site at <http://www.apple.com> to make sure you have an active Internet connection before using Software Update.

If you are using a proxy server, Software Update may not be able to download and install updates. Download software updates from Apple Software Downloads instead (http://www.apple.com/swupdates/).

Software updates are listed, but do not download

Software Update will quit most open applications before downloading any updates. If you are using a login agent such as PPPoE, or another application that must be open in order to keep your Internet connection active, you may not be able to use Software Update. Download software updates from Apple Software Downloads instead (http://www.apple.com/swupdates/).

For more information, refer to technical document 60598: "**Mac OS 9: Using Software Update with VPN/Connection 'Keep-Alive' Agents**"

If you are using a proxy server, Software Update may not be able to download and install updates. Download software updates from Apple Software Downloads instead (http://www.apple.com/swupdates/).

Software downloads, but does not update

If Software Update is able to successfully connect to the Internet and display a list of updates, but the updates do not appear to install, try the following troubleshooting steps:

1. Make sure the file is downloading during the update process by clicking the "Show Detailed Progress" disclosure triangle in the Software Update progress dialog. If the updates are not actually downloading, see section above "Software updates are listed, but do not download".

2. Try rebuilding the Desktop to ensure that all of the Software Update components are properly recognized by the system software. For more information on rebuilding the desktop, see technical document 10182 "**Mac OS: Rebuilding Desktop File and Icon Recovery**."

3. Try downloading and installing one or more of the updates from the AppleCare Web site to see if the installer indicates a possible issue.

iPhoto: Bound Books Limited to 50 Pages

When ordering an iPhoto book from Apple, do not include more than 50 pages.
This article has been archived and is no longer updated by Apple.

Symptom

When placing an order for an iPhoto book, one of the following alerts appears:

"You can purchase a bound book with at most 50 pages. You need to delete some pages or modify your layout."

"We've encountered a problem. Please try again later."

Solution

Bound Book

- Delete pages
- Change the layout to allow for more images per page

Other Options

- Print the book using your own printer
- Create a PDF (Portable Document Format) document

Books can be created with more than 50 pages, but you must use one of the two options listed above. Bound books ordered from Apple cannot exceed 50 pages.

Apple DVI to ADC Adapter: Compatibility Table

Learn about the DVI Graphic cards, and displays that are compatible with the Apple DVI to ADC Adapter.
This article has been archived and is no longer updated by Apple.
x

Apple DVI to ADC Adapter Compatibility Table

		15" Studio	17" Studio (LCD model)	20" Cinema	22" Cinema	23" Cinema HD
MacBook and MacBook Pro	13-inch	x	x	x	x	x
	15-inch	x	x	x	x	x
	17-inch	x	x	x	x	
Mac mini	PowerPC based and Intel based	x	x	x	x[7]	x
Mac Pro	NVIDIA Quadro FX 4500	x	x	x	x	x
	ATI Radeon X1900 XT	x	x	x	x	x
	NVIDIA GeForce 7300 GT	x	x	x	x	x
PowerBook G4 (with DVI port)	12-inch	x	x	x	x	x
	15-inch	x	x	x	x	x
	17-inch	x	x	x	x	x
Power Mac	Radeon 9000 Pro	x	x	x	x	x
	Radeon 9700 Pro	x	x	x	x	x
	GeForce4 Titanium*	x	x	x	x	x
	Radeon 7000**	x	no	no	x	no
	Radeon 8500**	x	x	x	x	x
	RAGE 128 Pro	x	x	no	x	no
	Radeon PCI*	x	x	no	x	no
	Radeon AGP/PCI**	x	x	no	x	no

Product specifications are subject to change without notice.
* Sold as build-to-order solution.
** Sold by ATI.

Notes:

1. When using the DVI to ADC Adapter to connect the Apple Studio Display 17 LCD to an ATI Rage 128 Pro video card a minimum of Mac OS 9.2.2 or Mac OS X 10.1.3 or greater is required.
2. The DVI to ADC Adapter is compatible only with LCD displays. It is not compatible with the Apple Studio Display 17 (ADC), as this is a CRT display.
3. Power and sleep functions are NOT supported with the Apple DVI to ADC adapter when used with Intel based systems, iMac G5 systems, and Power Mac G5 (Late 2005) or later systems.
4. The only compatible resolution for an Apple Studio Display 17 LCD with the Apple DVI to ADC adapter and any video card is 1280 by 1024 pixels.
5. For controls such as brightness control and power and sleep functions, the USB cable from the Apple DVI to ADC adapter needs to be plugged in to the computer. If these functions are not operating as expected, check to make sure the USB cable is connected properly.
6. Some applications, including games, may automatically switch to other resolutions when they are opened. This will result in an unreadable image. Depending on the software, you might be able to return to the native resolution by pressing the escape ("Esc") key, quitting the application, or clicking the mouse. If you cannot return to the native resolution, restart the computer. If the software leaves the resolution scrambled after restarting, reset the NVRAM. If resetting the NVRAM does not work, do the following:
7. For complete Mac mini and Cinema Display 22-inch DVI to ADC compatibility, go here for more information.
8. You can find the Apple DVI to ADC Adapter in the Apple Online store.

Mac OS 9

- Drag the Monitors Preferences folder (located in the Preferences folder in the System folder) to the Trash.

Mac OS X

1. Drag the com.apple.windowserver.plist preference file (located in /Library/Preferences) to the Trash.
2. When you connect a compatible PowerBook computer to a compatible display using the DVI to ADC adapter, resolutions other than the native display resolution do not scale.
3. Some bundled display cards will not work with all ADC features when an display is connected using the Apple ADC to DVI Display Adapter. Some examples of features that may not work with bundled display cards include:
    - Starting up the computer by pressing the display's power button when the computer is off.

- Putting the computer to sleep by pressing the display's power button when the computer is on.
- Shutting down the computer by pressing the display's power button when the computer is in Open Firmware mode.

Workarounds

- Use the main power button on the computer.
- Choose Sleep from the Apple menu (Mac OS X) or the Finder's Special menu (Mac OS 9).
- If computer is started in Open Firmware mode, type "shut-down" then press Return.

WebObjects 5: How to Connect to Sybase With EOModeler

This document explains how to install a Sybase JDBC driver and connect to the Sybase server with the EOModeler tool.
This article has been archived and is no longer updated by Apple.

Applicable products

- WebObjects 5.1
- WebObjects 5.2

Disclaimer for WebObjects 5.1: Sybase is not officially supported in WebObjects 5.1. This document only provides information on how to set up the connection panel in EOModeler so that you can connect to Sybase and reverse engineer an existing database with the EOModeler tool. Since Apple does not provide a Sybase plug-in, the JDBC adaptor functions like a generic JDBC adaptor.

To customize the JDBC adaptor, you can write a custom plug-in. See the Technical Note on how to write a JDBC plug-in at the URL:

http://developer.apple.com/technotes/tn/tn2027.html

Sybase server and JDBC driver used in this document:

- Sybase ASE version 12
- jconnect52.zip

Where to Obtain Sybase JDBC Drivers

The Sybase JDBC drivers are available from Sybase's Web site (http://www.sybase.com/). The files can be downloaded for free after you create a "MySybase" account.

Where to install the Sybase JDBC Driver

Assuming that you have downloaded the `jconnect52.zip` package, unzip the package and place the `jconn2.jar` file in the appropriate location.

Mac OS X

Place the Sybase `jconn2.jar` file into `/Library/Java/Extensions` or a directory listed in your `CLASSPATH`.

Windows 2000

1. Install the Sybase JDBC driver where the Java VM can find it.
The simplest procedure is to add the JDBC driver (`jconn2.jar`) to the Java VM's "extensions" directory. In Windows 2000, this directory is usually something similar to:
`C:\\jdk1.3\\jre\\lib\\ext\\`
The exact path depends on where JDK 1.3 is installed.

If preferred, the JDBC driver can be added to your `CLASSPATH`, either explicitly listing the jar file, or exploding the jar into a directory that is on the `CLASSPATH`.

2. For development or testing using Windows 2000, install the Sybase driver in `$NEXT_ROOT/Library/Java` and modify the `JavaConfig.plist` file accordingly.

If your WebObjects installation is not in `C:/Apple`, substitute the appropriate path in the instructions below.
Note: The UNIX notation of "/" for the directory separator is used in the instructions.

1. Log in with an administrator account.
2. Copy `jconn2.jar` to `C:/Apple/Library/Java/`
3. Edit the file `C:/Apple/Library/Java/JavaConfig.plist`
Add `$NEXT_ROOT/Library/Java/jconn2.jar` to the entry for the "DefaultClasspath". Items in the list should be separated by a semicolon ";".
Use the term "`$NEXT_ROOT`" literally, following the pattern of the other entries.

Specifying the URL and Driver in EOModler's connection panel

The URL should be of the format:

```
jdbc:sybase:Tds:<hostname>:<port#>
```

For example, to connect to a Sybase Server on myhost listening on port 4100, the URL will be:

```
jdbc:sybase:Tds:myhost:4100
```

You specify databases using the following URL syntax:

```
jdbc:sybase:Tds:<hostname>:<port#>/<database>
```

A character set can be specified using the following URL syntax:

```
jdbc:sybase:Tds:myServer:4100/testDB?charset=ascii_7
```

Enter the following into the Driver textfield in the EOModeler connection panel:

```
_Driver: com.sybase.jdbc2.jdbc.SybDriver
```

Note: The driver entry is needed for WebObjects 5.1 (all platforms) and WebObjects 5.2 (Windows 2000 only)

A typical JDBC Connection Panel in EOModeler looks like figure 1

Figure 1: Typical JDBC Connection Panel in EOModeler

Macintosh: How to Upgrade from Mac OS X 10.0 to Mac OS X 10.1

This document explains how to upgrade from Mac OS X 10.0 to Mac OS X version 10.1.
This article has been archived and is no longer updated by Apple.
Mac OS X 10.1 is a reference release of Mac OS X. It is **not** available for download.

Mac OS X 10.2 is available for ordering from the Apple Store (http://store.apple.com/).

Updates to the reference release Mac OS 10.1 can be downloaded. See the related document section for a list of updates.

Related Documents

AppleCare Protection Plan CD: Some CDs Contain Multiple Startup Volumes

Later versions (CD part 691-3597-A) of the AppleCare Protection Plan CD contains both Mac OS 9 and Mac OS X volumes. This enables customers to start up from either Mac OS 9 or Mac OS X.
This article has been archived and is no longer updated by Apple.

Multiple Startup Volumes

Later versions of the AppleCare contain both Mac OS 9 and Mac OS X enabling the AppleCare Protection Plan CD to be used as a startup disc in either operating system. This is sometimes referred to as a "dual-boot" CD.

Note: The versions of the operating system on some versions of the AppleCare Protection Plan CD may not start up all computers. For more information see technical document 25141: "**AppleCare Protection Plan CD: Cannot Start Up All Macintosh Computers**."

TechTool Deluxe

Versions of the AppleCare Protection Plan CD that can startup in either Mac OS 9 or Mac OS X contain a version of the TechTool Deluxe application that will work in either operating system with different interfaces depending on which operating system the computer is using. Both interfaces are compatible with Mac OS X.

Figure 1 - Mac OS 9.x TechTool application interfaces

Figure 2 - Mac OS X TechTool application interface

How to start up with different operating systems

Starting up with Mac OS 9

1. With the computer turned on and completely started up, insert the AppleCare Protection Plan CD.
2. Choose Restart from the Special menu.
3. Press and hold the C key.
4. Release the C key after the "happy Mac" face appears on screen.

   The computer continues starting up, and the CD window opens automatically when the desktop appears.
5. Double-click TechTool Deluxe in the open CD window.

Starting up with Mac OS X

1. Insert the APP CD into your computer.
2. Choose Restart from the Apple menu.
3. Press and hold down the Option key to open the Startup Manager.
4. Select the Mac OS X partition on the AppleCare Protection Plan CD from the Startup Manager screen
5. Click the right arrow button.
   TechTool Deluxe for Mac OS X loads directly bypassing the normal Finder desktop.

Figure 3 - Startup Manager screen

How to Use TechTool Deluxe

For directions on how to use the version of TechTool Deluxe that is on your AppleCare Protection Plan CD, follow the Quick Start Guide located

on that partition of your CD.

How to determine AppleCare Protection Plan CD version

See technical document 58739: "**AppleCare Protection Plan CD: Determining Version of TechTool Deluxe**."

Published Date: Feb 20, 2012

WebObjects 5: How to Rename a Project with Project Builder in Mac OS X

This document explains the process of renaming a WebObjects or Cocoa project with Project Builder in Mac OS X.
This article has been archived and is no longer updated by Apple.

Symptom

When renaming a WebObjects or Cocoa project using the Rename command from the Project menu in Project Builder, the resulting executable file may retain the original name of the project.

Solution

When renaming a WebObjects or Cocoa project with Project Builder in Mac OS X, the name must be changed in other places in addition to choosing Rename from the Project menu.

The developer document "**Discovering WebObjects for HTML**" outlines the initial steps in the renaming process. All the steps are listed below.

Assume you are starting with a project named "MyWOProject" and that you want to change its name to "MyNewWOProject".

1. Duplicate the "MyWOProject" directory and name it "MyNewWOProject".

2. Rename the MyWOProject.pbproj file inside the MyNewWOProject directory to MyNewWOProject.pbproj.

3. Open the MyNewWOProject project in Project Builder.

4. Rename the MyWOProject target MyNewWOProject
a) Click the Targets tab.
b) Select the MyWOProject target in the Targets list.
c) Choose Project->Rename.
d) Replace MyWOProject with MyNewWOProject.
e) Click the Files tab.

5. Choose Clean from the Build menu.
At this point, if you build the project, the file still has the name MyWOProject, as does the .woa directory and the URL for connecting to the application. A few more steps are necessary to complete the process.

6. Close the MyNewWOProject project in Project Builder or quit Project Builder, so that Project Builder will not attempt to prevent changes to the project files.

7. Open the MyNewWOProject/MyNewWOProject.pbproj/project.pbxproj file with a text editor.
This file is not immediately visible in the Finder, so choose from one of the following methods to open the project.pbxproj file:
a) From the Finder while pressing the CONTROL key, click on the MyNewWOProject.pbproj and select 'Show Package Contents' from the contextual menu.
b) Open project.pbxproj in a text editor.
c) Open a Terminal shell.
d) change directories (cd) to the MyNewWOProject.pbproj to get to the project.pbxproj file
e) Open project.pbxproj with a command-line text editor such as vi or emacs.

8. Replace all occurrences of MyWOProject in the project.pbxproj file with MyNewWOProject.
This updates CFBundleExecutable key, the NSExecutable key, the .woa directory, several intermediate build directories, some PRODUCT_NAME keys, and the application's jar files.
Important: Do not modify names of .java files.

9. Open MyNewWOProject in Project Builder.

10. Build and run the application.

The resulting executable file has the new name of MyNewWOProject.

AirPort Base Station (Dual Ethernet): Unable to Use 10.0.x./24 DHCP Leases with AirPort 2.0.4

After installing AirPort 2.0.4, the AirPort Base Station (Dual Ethernet) is no longer able to establish a DHCP connection to an ISP using a 10.0.0/24 network range (and any related subnets).
This article has been archived and is no longer updated by Apple.

Symptom

The AirPort base station's DHCP client refuses DHCP leases in the 10.0.0.x network range after firmware version 4.04 is installed as part of the AirPort 2.0.4 software.

Note: This issue does not affect the AirPort Base Station (Graphite).

Solution

- Update the AirPort Base Station (Dual Ethernet) using the AirPort 4.0.6 firmware update.
  This firmware is included with the AirPort 2.1 software that comes with Mac OS X 10.2. It can also be manually downloaded.
  See Related Documents for a link to the AirPort 4.0.7 firmware update.

iPhoto: About the Location of Imported Photos

This document describes where iPhoto stores the files of imported photos.
This article has been archived and is no longer updated by Apple.
iPhoto stores all information inside the folder named iPhoto Library. This folder is located inside the Pictures folder, which is in each user's Home folder or directory.

To back up this data, copy the entire iPhoto Library folder inside the appropriate user's /Home/Pictures folder to a different hard disk volume or to a CD-R or DVD-R disc.

Xserve: Won‘t Turn on After PCI Cards Are Installed

Some early short PCI cards can be inserted into the Xserve's PCI slots, but they will not work, and Xserve may not turn on.
This article has been archived and is no longer updated by Apple.

Symptom

Some early short PCI cards can be inserted into the Xserve's PCI slots, but they only partially fill the slot. Xserve will not turn on.

Solution

Inserting these cards may damage Xserve. Only use compatible PCI cards. If you do not know if the PCI card is compatible with Xserve, contact the card's manufacturer.

Important:

- The Xserve works with both 32-bit and 64-bit PCI cards at 33 MHz and 66 MHz, but requires 3.3 V universal cards.
- Do not install PCI cards, unless the cards physically fit. Different generations of PCI cards have different keys or "notches" in different positions on the PCI connector. The Xserve PCI connector is shown in figure 1.

Figure 1 PCI slot in the Xserve

The PCI connector on different PCI cards may have more "notches" than the Xserve PCI connector has keys. Ensure the PCI connector on such cards has two "notches" that match the keys on the Xserve PCI connector and that the card otherwise fits length-wise.

Mac OS X 10.1: Opening WebObjects Applications Without a Network Connection

This document explains how to open a WebObjects application when no network connection is available in Mac OS X 10.1.
This article has been archived and is no longer updated by Apple.

Symptom

Project Builder opens an Internet Explorer window when opening a WebObjects application. If the computer is not connected to a network, the browser does not load the application because it is unable to find the server's address. A similar issue can arise if the computer has an incomplete network configuration.

Solution

Solution 1: Select an alternate default browser to open .html files

You must have another browser installed on your computer to use this solution (see note for browsers tested).

1. Using the Finder, navigate to the Sites folder under your home. Alternatively, search for any html file using Sherlock.
2. Select "index.html"
3. Choose Show Info from the File menu.
4. Choose "Open with application" from the pop-up menu.
5. Choose another browser and click Change All.
Mac OS X now opens all .html files with the browser you selected instead of Internet Explorer, and the application will load properly in Project Builder.

Note: The following browsers were tested: OmniWeb, Netscape 6, iCab. You can perform the test yourself. Start Web Sharing in the System Preferences and load "localhost" in your browser. When the computer is not connected to the network not alert box should appear.

Solution 2: Use an IP address

In Mac OS X, Internet Explorer can load local addresses with no network connection if a numerical address of "127.0.0.1" is used instead of "localhost".

1. Open the project in Project Builder
2. Select Targets from the vertical tabs on the left.
The list of targets features your application name, Application Server and Web Server.
3. Select your application.
4. Select the Executables tab from the target settings panel.
5. Add the launch arguments:
```
-WOAdaptorURL http://127.0.0.1/cgi-bin/WebObjects
```

Solution 3: Set a local name for your computer

This solution requires administrator privileges and some Unix command-line knowledge. If you don't feel comfortable with these, use one of the previous solutions. The terminal commands are listed in fixed width font.

If Project Builder already loads a host name other than "localhost", go directly to step 7.

1. Open Terminal and go to the /etc folder:
```
cd /etc
```
2. Make a backup copy of your hostconfig file: (use the administrator password)
```
sudo cp -i hostconfig hostconfig.old
```

3. Open the file for editing:
```
sudo pico hostconfig
```

4. Insert your computer name instead of -AUTOMATIC- in the line:
```
HOSTNAME=-AUTOMATIC-
```

5. Save (Control-X)the hostconfig file.

6. Restart your computer to update the network settings.

7. Open NetInfo Manager.

8. Authenticate using the Domain > Security menu.

9. Browse to /machines/localhost and duplicate the directory (Edit menu).

10. Write your computer name (same as step 4) in the "name" property of "localhost copy".

11. Save your local copy (Domain menu).

Project Builder will now use your computer name instead of "localhost" and the application will load properly.

Xserve, Xserve (Slot Load): Starts Up in Open Firmware or Will Not Turn On

Xserve and Xserve (Slot Load) may start up to an Open Firmware prompt, or may not turn on.
This article has been archived and is no longer updated by Apple.

Symptom

The server starts up to an Open Firmware prompt, or it may not turn on (no power). In some cases, it may not recognize the drive bays or display any video on the monitor.

Solution

In a small number of servers, the ATA controller board may not be seated, or inserted, securely. Follow these steps:

1. Shut down the Xserve and disconnect the power cord.
2. Open the Xserve as described in the documentation that comes with it.
3. Remove the clips from the ATA controller board.
4. Remove the ATA controller board by lifting the controller board straight up from its connection to the main logic board and drive backplane.
5. Visually inspect the connectors on the ATA controller board, the logic board connector, and the mid plane board connector for damage and foreign material.
6. Reinstall the ATA controller board by aligning both the connector on the main logic board side and aligning the connector on the backplane side and pressing both edges in firmly and at the same time. Do not install the board one end or one side at a time.
7. Make sure the clips are fastened correctly.

Xserve: WebObjects 5.1 Deployment Located on Mac OS X Server 10.1.5 CD

Xserve has WebObjects 5.1 deployment software preinstalled on the hard disk. If there is a need to reinstall the software, it located on the Mac OS X Server 10.1.5 CD.
This article has been archived and is no longer updated by Apple.

Symptom

You cannot find the WebObjects Deployment CD in Xserve's accessories.

Solution

The WebObjects Deployment software is located on the Mac OS X Server CD. There is not a separate WebObjects Deployment CD in the Xserve bundle.

To reinstall WebObjects Deployment, double-click WebObjects X Deployment.mpkg.

WebObjects X Deployment.mpkg is located in the WebObjects 5.1 Deployment folder within the Additional Installs folder. See figure 1.

Figure 1 WebObjects X Deployment.mpkg location on the Mac OS X Server CD

If you are remotely installing the path is:

```
/Volumes/Mac\\ OS\\ X\\ Server/Welcome\\ to\\ Mac\\ OS\\ X\\ Server/Additional\\
Installs/WebObjects\\ 5.1\\ Deployment/WebObjects_X_Deployment.mpkg.
```

Apple DVI to ADC Adapter: Low-Level, High-Pitch Noise

This document describes an issue where the Apple DVI to ADC Adapter produces a low volume high-pitch noise which can be heard.

This article has been archived and is no longer updated by Apple.

Symptom

When the Apple DVI to ADC adapter is plugged into an AC outlet and the monitor is in sleep mode or off, you may hear a low-level, high-pitch noise coming from the adapter.

Solution

It is normal for you to hear the high-pitch noise when the monitor is in sleep mode or shut down. However, if this high-pitch noise is heard after the computer starts-up, or after waking from sleep, contact Apple support.

Published Date: Feb 19, 2012

Xserve: AGP Riser Card is not available as a separate part

The AGP riser card for Xserve is bundled with the ATI Radeon 8500 Graphics card.
This article has been archived and is no longer updated by Apple.
The AGP riser card for Xserve cannot be ordered separate of the ATI Radeon 8500 Graphics card.

The ATI Radeon 8500 Graphics card has been qualified by Apple for Xserve with the riser card. If you intend to use the AGP riser card with another graphics card, you need to contact the manufacturer of the card for compatibility information.

This information is only for G4-based Xserves as the Xserve G5 uses PCI-X rather than AGP.

Xserve: How to Shut Down Xserve Remotely

This document describes how to shut down an Xserve server when there is no monitor or keyboard connected to it.
This article has been archived and is no longer updated by Apple.
Since many Xserve servers may not have a keyboard or monitor connected to them, this document explains how to shut down from a remote location.

- If you have a keyboard and monitor connected to the server:

  1. Choose Shut Down from the Apple menu.

  OR
- If you do not have a keyboard and monitor attached:

  1. Use the Server Monitor application from a remote admin station.
  When monitoring an Xserve the 'Info' tab displays a Shutdown button.

  OR
- If you don't have a keyboard and monitor set up and do not have a remote monitoring station:

  1. Open the Terminal application on an admin station.
  2. Log into the Xserve by typing: **ssh root@xxx.xxx.xxx.xxx**
  Replace all 'x' characters with your server's IP address
  3. Enter the root password.
  This changes the terminal prompt to show you are now connected to the remote Xserve.
  4. Type **shutdown -h now** to shut down the server.
  Xserve shuts down.

Mac OS X Server 10.2: How to Set Up SSL for Mail Service

This document explains how to enable the mail service of Mac OS X Server 10.2 to make Secure Socket Layer (SSL) connections happen automatically.

This article has been archived and is no longer updated by Apple.

Summary

Setting up automatic SSL connections for the mail service of Mac OS X Server 10.2 requires these basic steps:

- Generate a Certificate Signing Request (CSR) and create a keychain.
- Obtain an SSL certificate from an issuing authority.
- Import the certificate into the keychain.
- Create a passphrase file.

Generating a CSR and Creating a Keychain

You generate a CSR and create a keychain by using the command-line tool certtool. A CSR is a file that provides information needed to issue an SSL certificate.

1. Log in to the server as root.

2. In the Terminal application, type the following two commands, pressing Return after each one:

cd /private/var/root/Library/Keychains/
/usr/bin/certtool r csr.txt k=certkc c

This begins an interactive process that generates a Certificate Signing Request (CSR) in the file **csr.txt** and creates a keychain named **certkc**.

3. In the New Keychain Passphrase dialog that appears, enter a passphrase or password for the keychain you are creating; enter the password or passphrase a second time to verify it; and click OK. Remember this passphrase, because later you must supply it again.

4. When '**Enter key and certificate label:**' appears in the terminal, type a one-word key, a blank space, and a one-word certificate label; then press Return:

For example, you could type your organization's name as the key and mailservice as the certificate label.

5. Type **r** and press Return when you see the following displayed in the Terminal window:

Please specify parameters for the key pair you will generate.

r RSA
d DSA
f FEE

Select key algorithm by letter:

6. Type a key size at the next prompt in the Terminal window, then press Return.

Valid key sizes for RSA are 512..2048; default is 512
Enter key size in bits or CR for default:

Larger key sizes are more secure, but require more processing time on your server. Key sizes smaller than 1024 are not accepted by some certificate issuing authorities.

7. Type **y** to confirm the algorithm and keysize at the next prompt (or type any other key to cancel the selection).

You have selected algorithm RSA, key size (size entered above) bits.
OK (y/anything)?

8. Type **b** when requested to specify how this certificate will be used, then press Return.

Enter cert/key usage (s=signing, b=signing AND encrypting):

9. Type **s** when requested to select a signature algorithm, then press Return.

...Generating key pair...

Please specify the algorithm with which your certificate will be signed.

5 RSA with MD5
s RSA with SHA1

Select signature algorithm by letter:

10. Type **y** when requested to confirm the selected algorithm, then press Return.

You have selected algorithm RSA with SHA1.
OK (y/anything)?

11. Enter a phrase or some random text at the next prompt, which is used as a challenge string, then press Return.

...creating CSR...
Enter challenge string:

12. The series of five prompts request the various components of the certificate's Relative Distinguished Name (RDN). Enter the correct information at each prompt, then press return after each entry.

For Common Name, enter the server's DNS name, such as server.example.com.
For Country, enter the country in which your organization is located.
For Organization, enter the organization to which your domain name is registered.
For Organizational Unit, enter something similar to a department name.
For State/Province, enter the full name of your state or province.

13. Type y to confirm the information you entered, then press Return (type any other key if the information is not correct).

Is this OK (y/anything)?

When '**Wrote (n) bytes of CSR to csr.txt**' appears, you have successfully generated a CSR and created the keychain that mail service needs for SSL connections.

Obtaining an SSL Certificate

You must purchase an SSL certificate from a certificate authority such as Verisign (http://www.verisign.com) or Thawte (http://www.thawte.com). You can do this by completing a form on the certificate authority's Web site. When prompted for your CSR, open the **csr.txt** file using a text editor, such as TextEdit, copy and paste the contents of the file into the appropriate field on the certificate authority's Web site.

When you receive your certificate, save it in a text file named **sslcert.txt**. You can do this with the TextEdit application. Make sure the file is plain text, not rich text, and contains only the certificate text.

Importing the Certificate Into the Keychain

To import SSL certificates into the keychain you created, use the command-line tool **certtool**.

1. Log in to the server as root.

2. Open the Terminal

3. Go to the directory where the saved certificate file is located.
For example, type **cd /private/var/root/Desktop** if the certificate file is saved on the desktop of the root user.

4. Type **certtool i sslcert.txt k=certkc** , then press Return:

Using certtool this way imports a certificate from the file named **sslcert.txt** into the keychain named **certkc**.

A confirmation that the certificate was successfully imported appears on the screen:

...certificate successfully imported.

Creating a Passphrase File

To create a Passphrase file, you will use TextEdit, then change the privileges of the file using the Terminal. Once this is done, mail service uses the passphrase file to unlock the keychain automatically.

1. Log in to the server as root (if you are not already logged in as root).

2. In TextEdit, create a new file and type the passphrase **exactly** as you entered it when you created the keychain. **Do not** press Return after typing the passphrase.

3. Make the file plain text by choosing Make Plain Text from the Format menu.

4. Save the file in the root keychain folder.
path: /private/var/root/Library/Keychains/.

5. Name the file **cerkc.pass.**

6. In the Terminal change the access privileges to the passphrase file so only root can read and write to this file.

Type the following two commands and press Return after each one:

cd /private/var/root/Library/Keychains/
chmod 600 certkc.pass

The mail service of Mac OS X Server 10.2 can now use SSL for secure IMAP connections.

7. Log out as root.

Notes

- If mail service is running, stop, then restart mail service to recognize the new certificate keychain.
- If you want to set up SSL for mail service on a server that doesn't have a display, follow the instructions above and then copy the keychain file "**certkc**" and the keychain passphrase file "**certkc.pass**" to the root keychain folder on the headless server.

Final Cut Pro and Final Cut Express: Not Compatible With NetInfo Login

Installing, updating, or using Final Cut Pro or Final Cut Express while logged in to Mac OS X as a NetInfo user may cause issues. You must be logged in as a local user.

This article has been archived and is no longer updated by Apple.

Symptom

- You cannot install or update the application.
- An alert box with a message such as "File Error: Unknown Folder" or "Insufficient access privileges" appears.

Solution

Log in as a local user instead of as a NetInfo user.

DVD@ccess: Macintosh Installer Read Me

This document contains the Read Me which accompanies the Macintosh version of the DVD@ccess Installer. The installer is not needed for computers using Mac OS X. The installer is included on DVD-Video discs which are created by DVD Studio Pro.

This article has been archived and is no longer updated by Apple.

DVD@ccess Mac Installer Read Me

Apple's DVD@ccess technology enables any Macintosh or Windows DVD player application to respond to web links included on a DVD-Video title.

If you add web links to a DVD project using DVD Studio Pro, the finished DVD will automatically include both Mac and Windows versions of the DVD@ccess installers. These installers are there so anyone wishing to play a title with web links can easily add the functionality to their playback computer.

To install the DVD@ccess software

1. Insert the finished DVD into the computer.
2. Open the DVD so you can view it's contents.
3. You will find a folder named "DVD@ccess", open it, then open the Mac folder.
4. Run the DVD@ccess Installer and follow the on-screen instructions.
5. Restart your computer to activate the DVD@ccess functionality.

Notes

- After installation, you can play your DVDs using any DVD playback application. When a web link is encountered during playback, the DVD@ccess
  software will automatically launch your browser and jump to the specified URL.
- The DVD@ccess functionality is built into recent versions of the Apple DVD Player application. It is not necessary to install the DVD@ccess software if your Mac is running version 2.4 or higher of the Apple DVD Player. (it doesn't hurt anything if you do install it on such systems).
- The software only needs to be installed once on a given computer; it is not tied to a specific DVD title.
- You can disable the DVD@ccess functionality at anytime by opening the DVD@ccess control panel and unchecking the "DVD@ccess Active" checkbox.
- DVD@ccess web links will only work properly if the playback computer has an internet connection. If a link does not work as expected, verify that you actually have a connection. (This does not apply to web links which reference local URLs, such as a file on the DVD or hard drive.)

Published Date: Oct 10, 2016

DVD@ccess: Microsoft Windows Installer Read Me

This document contains the Read Me which accompanies the Windows version of the DVD@ccess Installer. The installer is included on DVD-Video discs which are created by DVD Studio Pro.

This article has been archived and is no longer updated by Apple.

DVD@ccess Windows Installer Read Me

Apple's DVD@ccess technology enables Windows DVD player applications to respond to web links included on a DVD-Video title.

To install the DVD@ccess software

1. Insert the finished DVD into the computer.
2. Open the DVD so you can view it's contents.
3. You will find a folder named "DVD@ccess", open it, then open the PC folder.
4. Run the DVD@ccess Installer EXE and follow the on-screen instructions.
5. Restart your computer to activate the DVD@ccess functionality.

Notes

1. After installation, you can play your DVDs using any DVD playback application. When a web link is encountered during playback, the DVD@ccess software will automatically launch your browser and jump to the specified URL.
2. The software only needs to be installed once on a given computer; it is not tied to a specific DVD title.
3. You can disable the DVD@ccess functionality at anytime by opening the DVD@ccess control panel and unchecking the "DVD@ccess Active" checkbox.
4. DVD@ccess web links will only work properly if the playback computer has an internet connection. If a link does not work as expected, verify that you actually have a connection. (This does not apply to web links which reference local URLs, such as a file on the DVD or hard drive.)

Final Cut Pro: Sony Digital Camera Compatibility

This document provides additional compatibility notes for Sony consumer and professional digital cameras when used with Final Cut Pro 4.

This article has been archived and is no longer updated by Apple.

This is document does not contain a full list of qualified devices, only additional information on certain models.

A complete list of qualified devices for the current version of Final Cut Pro can be found at the Apple web site (http://www.apple.com/finalcutstudio/resources/devicelist.php).

For a complete list for Final Cut Pro 3 see document 93261 "**Final Cut Pro 3: Camera Compatibility Information**."

For additional assistance with Sony digital cameras, see the **Sony web site)**.

Click for PAL Compatibility Chart

Note: Sony uses the term iLink to describe FireWire (IEEE-1394).

Sony Qualified DV Camcorders and VTRs

NTSC

Model	Device Protocol	Description and Notes
DCR-PC1	FireWire	
DCR-PC5	FireWire	When editing to tape: On Mac OS X the sequence comes in on time. On Mac OS 9.2.2 the sequence comes in up to 2 frames late.
DCR-PC10	FireWire	
DCR-PC100	FireWire	
DCR-PC101	FireWire	Playback offset should be set to -1.
DCR-PC110	FireWire	On Mac OS 9.2.2 the sequence comes in up to 2 frames late.
DCR-TRV7	FireWire	When batch capturing clips widely separated by timecode, you may receive an incorrect error message stating that Final Cut Pro was "...unable to find timecode..." Individually capture clips separated by 3 minutes or more when using this camera.
DCR-TRV8	FireWire	
DCR-TRV18	FireWire	
DCR-TRV27	FireWire	When editing to tape, sequence may come in 1-2 frames late.
DCR-TRV120	FireWire	When editing to tape: On Mac OS X the sequence comes in up to 2 frames early and duplicates the first frame for up to 3 frames. On OS 9.2.2 the sequence comes in up to 10 frames early and starts the sequence 3 frames late.
DCR-TRV230	FireWire	When editing to tape on Mac OS X: The sequence comes in 3 frames late.
DCR-TRV310	FireWire	
DCR-TRV510	FireWire	
DCR-TRV520	FireWire	
DCR-TRV7000	FireWire	
DCR-TRV900	FireWire	When editing to tape: The sequence can come in up to 2 frames late on both Mac OS X and OS 9.2.2
DHR-1000v	FireWire	When editing to tape: On Mac OS X the sequence comes in up to 2 frames late. On Mac OS 9.2.2 the sequence comes in up to 2 frames late.
DCR-VX2000	FireWire	When editing to tape: On Mac OS X the sequence comes in up to 2 frames late.
DSR-3DSR-15002	FireWire	Playback signal of DVCRO recorded tape is not available over FireWire.

DSR-11	FireWire	If the deck is switched from NTSC to PAL (or vice versa), you must restart the computer to reset the FireWire bus for the signal change to be recognized.
DSR-20	FireWire	When editing to tape: On Mac OS X the sequence comes in on time and duplicates the first frame for up to 2 frames. On Mac OS 9.2.2 the sequence comes in on time and duplicates the first frame for up to 2 frames.
DSR-25	FireWire	If the deck is switched from NTSC to PAL (or vice versa), you must restart the computer to reset the FireWire bus for the signal change to be recognized.
DSR-30	FireWire	When editing to tape, the sequence can come in up to 2 frames late on both Mac OS X and OS 9.2.2
DSR-45	FireWire	
DSR-PD100A	FireWire	
DSR-PD150	FireWire	Firewire On Mac OS 9.2.2 the sequence comes in up to 1 frame late.
DSR-1600	FireWire	
DSR-200	FireWire	
DVMC-DA2 (DV-Analog Box)	FireWire	If your device is only equipped with the LANC device control connection, LANC will not transmit timecode to Final Cut Pro. However, you may use the media converter functions to convert video for transmit over FireWire. Device control will be available when using LANC however, timecode will be omitted preventing usage of such functions as, Batch Capture, and Capture Clip. These functions require a timecode reference to operate.
GV-D300	FireWire	When editing to tape: On Mac OS X the sequence records to tape up to 2 frames later than the specified in point, with the recorded material being up to 1 frame later than the material in the sequence
GV-D900	FireWire	On Mac OS 9.2.2 the sequence comes in up to 2 frames late.

iPhoto: "The music you selected cannot be opened" Alert

iPhoto may not play a previously selected music track during a slide show if the music file has been moved.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to play a slide show in iPhoto, an alert box with this message appears:

> "The music you selected cannot be opened."

Solution

If a music file has been moved in the Finder, iPhoto may not be able to locate it for a slide show. If iTunes 3 reorganized a music library, for example, the message will appear.

You can resolve this issue by reselecting the music file.

1. Select the photo album you want to use for your slide show.
2. Click Share in the iPhoto window.
3. Click Slide Show in the iPhoto window.
4. Choose Edit from the "Music" pop-up menu.
5. Select the track that is not playing correctly from the music list.
6. Click Delete.
7. Click Done.
8. Choose Other from the "Music" pop-up menu.
9. Locate the music file you want to use in the Open window.
10. Select the music file and click Open.
11. Click OK.

The slide show now works properly.

For additional assistance with Sony digital cameras, see the Sony web site.

Click for PAL Compatibility Chart

Important: No further compatibility testing with video cameras and Final Cut Pro 2.0.2 is planned. If your camera is not listed here, check the Final Cut Pro 3.0 compatibility document (see Related Documents for link).

Note: Sony uses the term iLink to describe FireWire (IEEE-1394).

Sony Qualified DV Camcorders and VTRs

NTSC

Model	Device Protocol	Description and Notes
DCR-PC1	FireWire	
DCR-PC5	FireWire	When editing to tape: On Mac OS X the sequence comes in on time. On Mac OS 9.2.2 the sequence comes in up to 2 frames late.
DCR-PC10	FireWire	
DCR-PC100	FireWire	
DCR-TRV7	FireWire	When batch capturing clips widely separated by timecode, you may receive an incorrect error message stating that Final Cut Pro was "...unable to find timecode..." Individually capture clips separated by 3 minutes or more when using this camera.
DCR-TRV8	FireWire	
DCR-TRV10	FireWire	
DCR-TRV11	FireWire	
DCR-TRV17	FireWire	
DCR-TRV20	FireWire	
DCR-TRV120	FireWire	When editing to tape: On Mac OS X the sequence comes in up to 2 frames early and duplicates the first frame for up to 3 frames. On OS 9.2.2 the sequence comes in up to 10 frames early and starts the sequence 3 frames late.
DCR-TRV230	FireWire	When editing to tape on Mac OS X: The sequence comes in 3 frames late.
DCR-TRV310	FireWire	
DCR-TRV320	FireWire	
DCR-TRV530	FireWire	
DCR-TRV7000	FireWire	
DCR-TRV720	FireWire	
DCR-TRV730	FireWire	
DCR-TRV900	FireWire	When editing to tape: The sequence can come in up to 2 frames late on both Mac OS X and OS 9.2.2
DHR-1000v	FireWire	When editing to tape: On Mac OS X the sequence comes in up to 2 frames late. On Mac OS 9.2.2 the sequence comes in up to 2 frames late.
DCR-VX2000	FireWire	When editing to tape: On Mac OS X the sequence comes in up to 2 frames late.
DSR-11	FireWire	If the deck is switched from NTSC to PAL (or vice versa), you must restart the computer to reset the FireWire bus for the signal change to be recognized.

DSR-20	FireWire	When editing to tape: On Mac OS X the sequence comes in on time and duplicates the first frame for up to 2 frames. On Mac OS 9.2.2 the sequence comes in on time and duplicates the first frame for up to 2 frames.
DSR-30	FireWire	When editing to tape, the sequence can come in up to 2 frames late on both Mac OS X and OS 9.2.2
DSR-40	FireWire	All Edit to Tape functions must be used with Apple FireWire device control protocol. When using Black and Code, the deck will cue to PAUSE mode. You must hit stop manually on the deck to start Black and Code. Black and Code will start automatically. When editing to tape: On Mac OS X the sequence comes in on time and can duplicate the first frame up to 2 frames. On Mac OS 9.2.2 the sequence comes in on time and can duplicate the first frame up to 2 frames.
DSR-1500	FireWire	
DSR-1500a	FireWire	
DSR-PD100A	FireWire	
DSR-PD150	FireWire	Firewire On Mac OS 9.2.2 the sequence comes in up to 1 frame late.
DSR PD 1500AP	FireWire	With repeatedly opening the Log & Capture Window or Edit to Tape window, the FireWire connection can be lost. Turning the device off and then on again will fix the problem.
DSR-1600	FireWire	
DSR-1800	FireWire	
DSR-200	FireWire	
DVMC-DA2 (DV-Analog Box)	FireWire	If your device is only equipped with the LANC device control connection, LANC will not transmit timecode to Final Cut Pro. However, you may use the media converter functions to convert video for transmit over FireWire. Device control will be available when using LANC however, timecode will be omitted preventing usage of such functions as, Batch Capture, and Capture Clip. These functions require a timecode reference to operate.
DVMC-MS1	FireWire	
GV-D300	FireWire	When editing to tape: On Mac OS X the sequence comes in up to 2 frames late with the sequence being up to 1 frame late.

Sony Qualified DV Camcorders and VTRs

PAL

Model	Device Protocol	Description and Notes
DSR-11	FireWire	
DSR PD 150	FireWire	On Mac OS 9.2.2 the sequence can duplicate the first frame for up to 6 frames.
DSR-2000	FireWire	
DCR-PC2E	FireWire	This camera needs the DV Tuner 1 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro 2. These are included with Final Cut Pro 2 installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 1" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. No Media-In by design

DCR-TRV5E	FireWire
DCR-TRV8E	FireWire
DCR-TRV9E	FireWire
DCR-TRV900E	FireWire

Canon Qualified DV Camcorders and VTRs

NTSC

Model	Device Protocol	Description and Notes
Elura	FireWire Basic	This camera needs the DV Tuner 2 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro. These are included with Final Cut Pro installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 2" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. When editing to tape: On Mac OS X, the sequence comes in up to 4 frames early and duplicates the first frame for up to 18 frames. On Mac OS 9.2.2 the sequence comes in up to 1 frame early and duplicates the first frame for up to 8 frames.
Elura 2MC	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 19 frames. On Mac OS 9.2.2 the sequence comes in up to 6 frames early and duplicates the first frame for up to 16 frames.
Elura 20MC	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 7 frames early and duplicates the first frame for up to 15 frames. On Mac OS 9.2.2 the sequence comes in up to 7 frames early and duplicates the first frame for up to 14 frames.
Elura 40MC	FireWire Basic	With Edit To Tape this device will come in up to 6 frames early and dupe the first frame up to 19 frames.
GL1	FireWire Basic	This camera needs the DV Tuner 2 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro. These are included with Final Cut Pro installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 2" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. When editing to tape: On Mac OS X the sequence comes in up to 4 frames early and duplicates the first frame for up to 17 frames. On Mac OS 9.2.2 the sequence comes in up to 4 frames early and duplicates the first frame for up to 7 frames.
GL2	FireWire Basic	Note: Edit to Tape will be 6 frames early and duplicate the first frame of the sequence up to 18 frames.
Optura	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 3 frames early and duplicates the first frame for up to 10 frames. On Mac OS 9.2.2 the sequence comes in up to 3 frames early and duplicates the first frame for up to 11 frames.
Optura 100 MC	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 7 frames early and duplicates the first frame for up to 12 frames. On Mac OS 9.2.2 the sequence comes in up to 7 frames early and duplicates the first frame for up to 17 frames.

Optura Pi	FireWire Basic	Timecode refresh of DV tapes not recorded on the Optura Pi will stutter in Final Cut Pro 2.0 and on the Optura Pi LCD screen. This may result in dropped frame warnings, or timecode break detection warnings after capturing clips. Use only tapes that were recorded on the Optura Pi for editing. This camera needs the DV Tuner 2 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro. These are included with Final Cut Pro installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 2" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. When editing to tape: On Mac OS X the sequence comes in up to 2 frames late and duplicates the first frame for up to 6 frames. On Mac OS 9.2.2 the sequence comes in up to 2 fram es late and duplicates the first frame for up to 2 frames.
Optura Xi	FireWire Basic	This camcorder needs +7 frames added to the Edit In timecode with an observed accuracy of +/- 1 frame and requires a Device Control Preset Playback Offset Adjustment of -17 frames.
Ultura	FireWire Basic	This camera needs the DV Tuner 2 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro. These are included with Final Cut Pro installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 2" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 14 frames.
XL1	FireWire Basic	Requires FireWire Basic. When the Canon XL1 is editing to tape, it will come in up to 6 frames early, then duplicate that first frame up to 15 frames.
XL1s	FireWire Basic	Requires FireWire Basic. When the Canon XL1s is editing to tape, it will come in up to 6 frames early, then duplicate that first frame up to 15 frames.
ZR	FireWire Basic	When editing to tape: On Mac OS X, the sequence comes in up to 3 frames early and duplicates the first frame for up to 18 frames.Ã On OS 9.2.2 the sequence comes in up to 4 frames early and duplicates the first frame for up to 11 frames.
ZR10	FireWire Basic	Using Assemble Edit to print Final Cut Pro projects to tapes that have been continually used and worn may contain audio drops. If you experience this problem, use a new tape. When editing to tape: On Mac OS X the sequence comes in up to 2 frames late and duplicates the first frame for up to 4 frames. On Mac OS 9.2.2 the sequence comes in up to 4 frames late and duplicates the first frame for up to 2 frames.
ZR 20	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames. On Mac OS 9.2.2 the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames.
ZR25	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames. On Mac OS 9.2.2 the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames.

ZR30 M	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 22 frames. On Mac OS 9.2.2 the sequence comes in up to 6 frames early and duplicates the first frame for up to 30 frames.
ZR40	FireWire Basic	For optimum performance Canon recommends that the ZR-40 not be used simultaneously with other FireWire devices. When editing to tape, the camera may come in up to 6 frames early, and duplicate the first frame of the sequence up to 12 frames.
ZR45	FireWire Basic	For optimum performance Canon recommends that the ZR-45 not be used simultaneously with other FireWire devices. When editing to tape, the camera may come in up to 6 frames early, and duplicate the first frame of the sequence up to 12 frames.
ZR 60	FireWire Basic	This camcorder needs +6 frames added to the Edit In timecode with an observed accuracy of +/- 1 frame. A Device Control Preset Playback Offset Adjustment of -19 frames printed to tape with intermittent duplication of the first frame.

Canon Qualified DV Camcorders and VTRs

PAL

Model	Device Protocol	Description and Notes
DM-MV1	FireWire Basic	No Media-In by design.
DM-MV4i	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 13 frames. On Mac OS 9.2.2 the sequence comes in up to 6 frames early and duplicates the first frame for up to 13 frames.
DM-MV10	FireWire Basic	No Media-In by design.
DM-MV100	FireWire Basic	No Media-In by design.
DM-XL1	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 4 frames early and duplicates the first frame for up to 18 frames. On Mac OS 9.2.2 the sequence comes in up to 4 frames early and duplicates the first frame for up to 12 frames.
DM-XL1s	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 4 frames early and duplicates the first frame for up to 17 frames. On Mac OS 9.2.2 the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames.
DM-MV3i	FireWire Basic	This camera needs the DV Tuner 2 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro. These are included with Final Cut Pro installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 2" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. When editing to tape: On Mac OS X the sequence comes in up to 2 frames early and duplicates the first frame for up to 7 frames. On Mac OS 9.2.2 the sequence comes in up on time and duplicates the first frame for up to 8 frames.

DM-MV20i	FireWire Basic	This camera needs the DV Tuner 2 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro. These are included with Final Cut Pro installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 2" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. Needs CMP Overide and Tuner 2. When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames. On OS 9.2.2 the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames.
DM-MV200i	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 4 frames early and duplicates the first frame for up to 24 frames. On Mac OS 9.2.2 the sequence comes in up to 4 frames early and duplicates the first frame for up to 10 frames.
DM-MV300i	FireWire Basic	This camera needs the DV Tuner 2 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro. These are included with Final Cut Pro installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 2" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. When editing to tape: On Mac OS X the sequence comes in up to 2 frames early and duplicates the first frame for up to 7 frames. On Mac OS 9.2.2 the sequence comes in on time and duplicates the first frame for up to 8 frames.
MV450i	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 5 frames early and can start the sequence up to 5 frames late. On Mac OS 9.2.2 the sequence comes in up to 4 frames early and duplicates the first frame for up to 20 frames.
MVX1i	FireWire Basic	This camera occasionally dropps frames during batch capture on lower speed laptops (400 Mhz or lower). Additionally, while assemble editing on all cpus, the video consistently comes in 6 frames early. When editing to tape: On Mac OS X the sequence comes in up to 7 frames early and duplicates the first frame for up to 15 frames. On Mac OS 9.2.2 the sequence comes in up to 7 frames early and duplicates the first frame for up to 15 frames.
XM-1	FireWire Basic	This camera needs the DV Tuner 2 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro. These are included with Final Cut Pro installer and updater CDs. Once installed, locate the folder called "Extras" and you will find "DV Tuner 2" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames. On Mac OS 9.2.2 the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames. Edit to tape not functioning with some Macintosh models.

Model	Device Protocol	Description and Notes
Elura	FireWire Basic	This camera needs the DV Tuner 2 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro 2. These are included with Final Cut Pro 2 installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 2" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. When editing to tape: On Mac OS X, the sequence comes in up to 4 frames early and duplicates the first frame for up to 18 frames. On Mac OS 9.2.2 the sequence comes in up to 1 frame early and duplicates the first frame for up to 8 frames.
Elura 2MC	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 19 frames. On Mac OS 9.2.2 the sequence comes in up to 6 frames early and duplicates the first frame for up to 16 frames.
Elura 40MC	FireWire Basic	With Edit To Tape this device will come in up to 6 frames early and dupe the first frame up to 19 frames.
GL1	FireWire Basic	This camera needs the DV Tuner 2 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro 2. These are included with Final Cut Pro 2 installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 2" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. When editing to tape: On Mac OS X the sequence comes in up to 4 frames early and duplicates the first frame for up to 17 frames. On Mac OS 9.2.2 the sequence comes in up to 4 frames early and duplicates the first frame for up to 7 frames.
GL2	FireWire Basic	Note: Edit to Tape will be 6 frames early and duplicate the first frame of the sequence up to 18 frames.
Optura	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 3 frames early and duplicates the first frame for up to 10 frames. On Mac OS 9.2.2 the sequence comes in up to 3 frames early and duplicates the first frame for up to 11 frames.

Optura Pi	FireWire Basic	Timecode refresh of DV tapes not recorded on the Optura Pi will stutter in Final Cut Pro 2.0 and on the Optura Pi LCD screen. This may result in dropped frame warnings, or timecode break detection warnings after capturing clips. Use only tapes that were recorded on the Optura Pi for editing. This camera needs the DV Tuner 2 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro 2. These are included with Final Cut Pro 2 installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 2" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. When editing to tape: On Mac OS X the sequence comes in up to 2 frames late and duplicates the first frame for up to 6 frames. On Mac OS 9.2.2 the sequence comes in up to 2 fram es late and duplicates the first frame for up to 2 frames.
Ultura	FireWire Basic	This camera needs the DV Tuner 2 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro 2. These are included with Final Cut Pro 2 installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 2" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should NOT be installed when using other DV devices, unless specified. When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 14 frames.
Vistura	FireWire Basic	
XL1	FireWire Basic	Requires FireWire Basic. When the Canon XL1 is editing to tape, it will come in up to 6 frames early, then duplicate that first frame up to 15 frames.
XL1s	FireWire Basic	Requires FireWire Basic. When the Canon XL1s is editing to tape, it will come in up to 6 frames early, then duplicate that first frame up to 15 frames.
ZR	FireWire Basic	When editing to tape: On Mac OS X, the sequence comes in up to 3 frames early and duplicates the first frame for up to 18 frames.Ê On OS 9.2.2 the sequence comes in up to 4 frames early and duplicates the first frame for up to 11 frames.
ZR10	FireWire Basic	Using Assemble Edit to print Final Cut Pro 2 projects to tapes that have been continually used and worn may contain audio drops. If you experience this problem, use a new tape. When editing to tape: On Mac OS X the sequence comes in up to 2 frames late and duplicates the first frame for up to 4 frames. On Mac OS 9.2.2 the sequence comes in up to 4 frames late and duplicates the first frame for up to 2 frames.
ZR20	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames. On Mac OS 9.2.2 the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames.
ZR25	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames. On Mac OS 9.2.2 the sequence comes in up to 6 frames early and duplicates the first frame for up to 15 frames.
ZR30 M	FireWire Basic	When editing to tape: On Mac OS X the sequence comes in up to 6 frames early and duplicates the first frame for up to 22 frames. On Mac OS 9.2.2 the sequence comes in up to 6 frames early and duplicates the first frame for up to 30 frames.

Final Cut Pro 4.1: Third-Party Hardware Compatibility

This document provides additional compatibility notes for third-party hardware when used with Final Cut Pro 4.1

This article has been archived and is no longer updated by Apple.

This is document does not contain a full list of qualified devices, only additional information on certain models. A complete list of qualified devices for the current version of Final Cut Pro can be found at the Apple web site (http://www.apple.com/finalcutpro/qualification.html).

For additional assistance with any of the hardware listed below, see the individual hardware manufacturer's web site.

Third Party Hardware Qualified Equipment

Model	Description and Notes
AJA KonaSD	
AJA Kona HD	Currently not qualified on G5 or Panther with Final Cut Pro 4
Aurora Igniter RT	Currently not qualified on G5 or Panther with Final Cut Pro 4
Pinnacle Cinewave RT	
Pinnacle Cinewave RT Pro	
Pinnacle Cinewave HD	
Io Devices	
AJA Io	Currently not Qualified on the G5 or Panther. At times users may see incorrect device control errors reported after very large batch captures. A workaround can be to use a qualified serial adapter instead of the device control on the AJA Io.
Serial Device Control	
Gee-Three Stealth	Works with both Mac OS 9 and Mac OS X, but erroneously reports a break in timecode where there is none on the Power Mac G4 (Mirrored Drive Doors) computers.
Keyspan SX Pro Serial	Qualified for Mac OS X only.
Keyspan Miniport Replicator	Qualified for Mac OS X only.
Keyspan USB Serial Adaptor	Qualified for Mac OS X only.
Keyspan USB 4 Port Serial Adaptor	Qualified for Mac OS X only.

AppleWorks 6: Decreased image quality when printing

Images placed in an AppleWorks 6 document may appear blurry when printed if the image dimensions have been reduced in size.

This article has been archived and is no longer updated by Apple.

Symptom

A scaled picture in and AppleWorks drawing or word processing document is blurry when printed.

Solution

1. From the **File** menu, choose **Save As**.
2. From the **File Format** menu, choose **AppleWorks 5.0**.
3. Enter a new name in the "Save As:" text field.
4. Click Save.
5. Close the document.
6. Locate the copy of the document you just saved.
7. Double-click the document.
8. Print the document.

This document will be updated when additional information is available.

Xserve: "A file of the same name already exists" alert appears when saving

This article has been archived and is no longer updated by Apple.

Upgrade to Mac OS X Server 10.2 if you are unable to save an existing file on Xserve.

Symptom

When saving an existing document on Xserve, an alert box with this message appears:

> "Could not save <filename> because a file of the same name already exists".

Note: This issue may occur when you connect to server using Apple File Protocol (AFP).

Solution

This issue is resolved in Mac OS X Server 10.2 or later.

QuickTime 6: Apple DVD Player Stops Working on Power Macintosh G3 (Blue and White)

Installing QuickTime 6 on a Power Macintosh G3 (Blue and White) computer with Mac OS 9 installed may cause Apple DVD Player to stop working.
This article has been archived and is no longer updated by Apple.

Symptom

An alert box with this message appears when you open Apple DVD Player:

> "Apple DVD Player cannot open because the required hardware was not found".

Products Affected

- Power Macintosh G3 (Blue and White)
- QuickTime 6
- Mac OS 9
- DVD Player 1.2 and 1.3

Solution

Reinstall QuickTime 5. Follow the instructions in technical document 61621, "QuickTime 6: How to Revert to QuickTime 5".

Published Date: Oct 10, 2016

Xserve: Security Lock Does Not Lock Hard Drive Tray

Xserve's security lock does not prevent a hard drive tray latch from being pressed and opened. Xserve may stop responding if you eject a hard drive while the server is operating.
This article has been archived and is no longer updated by Apple.

Symptom

if you press the latch for the hard drive that is the startup disk, Xserve may stop responding ("hang", or "freeze").

Xserve loses access to the hard drive if you press the latch for a hard drive that is not the startup disk.

Note: Xserve's security lock does not prevent a hard drive tray from being pressed and opened.

Solution

Download and install Mac OS X Server 10.2.4 or later. You may use the Software Update feature of System Preferences, or download the software from Apple Software Downloads (http://www.apple.com/swupdates/). For more information on Mac OS X Server 10.2.4, see technical document 70171, "**Mac OS X Server Update 10.2.4: Information and Download**".

Mac OS 9: "Apple DVD Player does not support the video card or settings used for the main screen" Alert

Some computers, when started up from Mac OS 9, may not be able to play a movie from a DVD-Video disc on an external display or TV.
This article has been archived and is no longer updated by Apple.

Symptom

An alert box with this message appears:

> "Apple DVD Player does not support the video card or settings used for the main screen".

Figure 1 Alert box

Solution

- If you're using Mac OS 9, disconnect the external display and adapter.
- Use Mac OS X. Mac OS X DVD Player allows you to play the movie on the external monitor.

Xserve: Use Gigabit Ethernet Card Only in the AGP/PCI Slot

You should not move the optional Gigabit Ethernet Card for Xserve from the PCI/AGP slot to a PCI slot.

Note: The optional Gigabit Ethernet Card is installed at the factory in the PCI/AGP slot.

This article has been archived and is no longer updated by Apple.

Symptom

Data corruption may occur if the Gigabit Ethernet card is installed in either the upper or lower PCI slots.

Solution

To avoid possible data corruption, leave the optional Gigabit Ethernet Card in its factory-installed location (PCI/AGP slot).

This document will be updated with additional information as it becomes available.

Mac OS X 10.2: Modem Country Setting Is Incorrect After Installing Mac OS X 10.2

After installing Mac OS X 10.2 the modem country setting in System Preferences is set to an incorrect location.
This article has been archived and is no longer updated by Apple.

Symptom

The Country Setting in the Modem tab of the Network preferences pane is different from what you selected during installation.

Solution

Change the modem country code in System Preferences.

1. Choose System Preferences from the Apple menu.
2. Choose Date & Time from the View menu.
3. Click the Time Zone Tab.
4. Make sure the Time Zone is set correctly.
   If the Time Zone is incorrect, click your part of the world, then choose a city in your time zone from the Closest City pop-up menu.
5. Choose Network from the View menu.
6. Select Internal Modem from the Show pop-up menu.
7. Click the Modem tab.
8. Ensure the Country Setting is correct.
   If the Country Setting is not correct, click Change and follow steps 3 through 8 again.

Note: Some areas do not have a country setting, so changing to that area does not affect the Country Setting. To avoid these issues, choose a location in the US or Canada.

iMac (17-inch Flat Panel): About the VGA Port

You can use the video mirroring feature of the iMac (17-inch Flat Panel) computer when a monitor is connected to the computer's mini-VGA monitor port.

This article has been archived and is no longer updated by Apple.

The iMac computer has a mini-VGA monitor port located on the rear of the computer in the I/O port area.

Figure 1. iMac (17-inch Flat Panel) rear I/O port area.

This port allows you to use the iMac's video mirroring feature with a compatible VGA monitor. Video mirroring allows you to see on a second monitor the same image you see on the iMac's flat-panel display. This feature does not allow you to extend the iMac desktop with the external monitor. An Apple VGA Display Adapter, part number M8639G/A (available separately), is required to plug in the monitor cable.

The video mirroring feature is 'plug and play'. Connect your monitor to the Apple VGA Display Adapter, then connect the Apple VGA Display Adapter to the mini-VGA port located on the back of the computer. When connecting the Apple VGA Display Adapater to the computer, the screen may refresh for an instant as the machine
reconfigures for video output.

Any VGA monitor that is compatible with these resolutions and frequencies can be used:

Resolution in Pixels	Frequency
640 by 480	60 Hz
800 by 600	75 Hz
1024 by 768	75 Hz

The computer will attempt to match the resolution of the built-in and external display. If there is no way to match, the computer will change both screen resolutions and may black out areas on the built-in display in order to compensate for the capabilities of the external display.

You can switch resolutions and frequencies in the Displays Preference Pane of Mac OS X System Preferences, or in the Monitor control panel of Mac OS 9.

For connecting displays that use another type of connector, or requires a resolution and frequency that is not compatible with the iMac, you can use a third-party scan converter in conjunction with the Apple VGA Display Adapter. To learn what scan converters are available for Macintosh systems, see the Macintosh Products Guide at (http://guide.apple.com/) for the latest devices.

Apple DVD Player for Mac OS X supports DVD playback through external video mirroring. DVD playback is automatically set to play on the external VGA display connected to the Apple VGA Display Adapter when opened. Apple DVD Player for Mac OS 9 does not support this feature. You should disconnect any external display when playing DVD video in Mac OS 9.

Important: The Apple VGA Display Adapter (M8639G/A) should not be confused with the Apple Video Adapter (M8734G/A). The Apple Video Adapter (M8734G/A) is **not compatible** with the iMac mini-VGA monitor port.

Macintosh Manager 2.2: Mac OS 8 Uses Different Documents Folder Than Mac OS 9

Files are saved in different locations when using Macintosh Manager 2.2 client and Mac OS 8.1 through Mac OS 9.2.2.

This article has been archived and is no longer updated by Apple.

Symptom

It may appear that a document has disappeared if you created and saved it when logged in from a computer using Mac OS 9 and then later logged in from a computer using Mac OS 8 (and visa-versa). No document loss has occurred, but in order to find the document you have to log in from a computer using the same version of Mac OS as the computer you used to create the document.

Solution

Update to Macintosh Manager 2.2.1 or later. It is available from Apple Software Downloads (http://www.apple.com/swupdates/).

Published Date: Oct 10, 2016

Power Mac G4 (Mirrored Drive Doors), (FW 800): Hard Drive Carrier May Have Hold Down Screws

Some Power Mac G4 (Mirrored Drive Doors) and Power Mac G4 (FW 800) computers come with a screw to hold down the ATA 100 drive carrier.

This article has been archived and is no longer updated by Apple.

The "Working Inside Your Computer" chapter of the Power Mac G4 Setup Guide describes and illustrates installing internal storage devices but it does not indicate a screw present on the tab securing the drive carrier to the chassis. If a screw is present holding down the ATA 100 drive carrier tab in your computer, be sure to remove the screw. See Figure 1.

Figure 1 Location of hold down screw

If the hard drive carrier hold down screw is present, be sure to remove it before you remove the ATA 100 drive carrier.

Reinstall the screw when the carrier is back in place.

Note: The Customer Installable Parts (CIP) ATA Hard Drive Replacement instructions correctly refer to the possible presence of the screw.

Mac OS X 10.2: How to Record Sound From Classic Applications

With Mac OS X 10.2 you can record sound from most Classic applications that manage sound input using the Sound Manager.
This article has been archived and is no longer updated by Apple.
With Mac OS X 10.2 you can record sound from most Classic applications that manage sound input using the Sound Manager.

To record sound using Classic applications:

1. Open System Preferences
2. Choose Sound from the View menu. The Sound preference pane opens.
3. Click the Input tab.
4. Choose a device for sound input (for example, the internal microphone)
5. Slide the Input volume to the level you want.
6. Record from the Classic application as you normally would.

Notes

1. Update to Mac OS X 10.2.4 or later to address an issue in which Classic applications that use voice-activated recording may not work.
2. Classic applications that use ASIO or specialized hardware for recording will not open in Mac OS X 10.2 in the Classic mode. These applications require you to start up the computer with Mac OS 9.

Published Date: Feb 19, 2012

Power Mac G4 (Mirrored Drive Doors): Results of Mixing PC2100 and PC2700 RAM

This document describes what happens if you install both PC2100 and PC2700 memory in either a 167 MHz or a 133 MHz system bus Power Mac G4 (Mirrored Drive Doors) computer.

Note: "PC2100" is the industry standard name for DDR-266 SDRAM used on a 133 MHz system bus.

"PC2700" is the industry standard name for DDR-333 SDRAM used on a 167 MHz system bus.

This article has been archived and is no longer updated by Apple.
The Power Mac G4 (Mirrored Drive Doors) computer comes in two different models. One has a 133 MHz system bus, which uses PC2100 RAM (memory). The other has a 167 MHz system bus, which uses PC2700 RAM. If you install the wrong RAM in the computer, it may not start up, or recognize the memory.

133 MHz System Bus Model

- When only PC2700 or a mix of PC2700 and PC2100 DIMMs is installed:
  The computer starts up normally and behaves as though PC2100 DIMMs are installed.
- When no memory is installed:
  The computer does not make a normal startup sound. Instead, you hear a single tone, and the LED on the front of the computer flashes continuously.

167 MHz System Bus Model

- When only PC2100 DIMMs are installed:
  The computer makes three single tones instead of the startup sound. The LED on the front of the computer flashes three times, and the computer does not startup.
- When a mix of PC2100 and PC2700 DIMMs is installed:
  The computer starts up normally, but neither the computer nor Apple System Profiler recognizes the PC2100 memory.
- When no memory is installed:
  The computer does not make a normal startup sound. Instead, you hear a single tone and the LED on the front of the computer flashes continuously.

Important: DDR-SDRAM is closely correlated with your computer's system bus speed. Use PC2100 DDR-SDRAM for 133 MHz system bus Power Mac computers and PC2700 DDR-SDRAM for 167 MHz system bus Power Mac computers. Do not try to install non-DDR memory into the Power Mac G4 (Mirrored Drive Doors) computer as it will not physically fit in the DIMM slots. If you do so, you could damage the logic board.

Mac OS X 10.2 - Panasonic Set-Top DVD-R Discs Do Not "Mount" Properly

Update to Mac OS X 10.2.5 to address an issue in which DVD-R discs created using Panasonic E-20 and Panasonic E-30 Set-Top DVD recorders appear on the desktop but have no items and zero space available.
This article has been archived and is no longer updated by Apple.

Symptom

DVD-R discs created using Panasonic E-20 and Panasonic E-30 Set-Top DVD recorders appear on the desktop in Mac OS X 10.2, but appear to have no items and zero space available.

Solution

Update to Mac OS X 10.2.5.
Published Date: Feb 19, 2012

Macintosh Manager 2.2.1: About Macintosh Manager Document

This document contains the contents of the About Macintosh Manager document for Macintosh Manager 2.2.1.

This article has been archived and is no longer updated by Apple.

About Macintosh Manager 2.2.1

This document includes information about additional Mac OS client software for use with the Mac OS X Server v.10.2. The Macintosh Manager Installer installs Macintosh Manager 2.2.1 client software, a version of AppleShare Client, and Macintosh Manager 2.2.1 administration software.

Macintosh Manager is Apple's workstation management technology, providing network administrators with a centralized method of securing Mac OS workstations, controlling software access, and providing a consistent, personalized experience for users.

For more information about these software applications, refer to the "Mac OS X Server Administrator's Guide," the online Help for Macintosh Manager and Mac OS X Server Help.

Changes in Macintosh Manager 2.2.1

- Fixed a problem where Mac OS 8.x clients would save user's documents inside the `~/Library/Documents` folder instead of their usual `~/Documents` folder. This would prevent users from being able to access their documents from Mac OS 9 client workstations.

Changes in Macintosh Manager 2.2

- To provide compatibility with Mac OS X client applications that may share the same Mac OS X server, the location of preferences and other redirected folders in Macintosh Manager 2.2 has changed. Information was previously stored inside a Library folder on the server volume. Macintosh Manager 2.2 now stores client information inside a folder called Classic inside the current Library folder. Because it cannot be determined if existing preferences are being utilized by Mac OS X clients, no migration is available to previous versions of Macintosh Manager.
- When connected to the network and the idle lockout feature is activated, you can use server administrator passwords to log in. Note: Server administrator passwords should not be confused with Macintosh Manager administrator passwords.
- The workstation name is now displayed in the login window (as opposed to the Apple menu in previous versions), similar to what you see in a Mac OS X login window. Additionally, the optional banner message is displayed in a smaller font.
- It is now possible to use the Command-E to eject CDs and floppies from drives while login window is displayed.
- When you create new workgroups, the initial setting for where applications are found is now set to "Use local first." Using this setting can help decrease login times on workstations.
- A new option is available in the Privileges pane of the Workgroups pane of the Macintosh Manager administrator application that allows the administrator to lock the user's Library folder (and most folders within it). This prevents users from changing the Library folder or its contents. To maintain application compatibility, applications can still to write to the Library folder even if the lock mechanism is activated. The default for this option is Off.
- Energy Saver preferences are no longer supported by Macintosh Manager 2.2.
- When a user logs out, the confirmation window's default time for automatic logout has been changed from 90 seconds to 30 seconds.

Problems addressed in Macintosh Manager 2.2

- When a user enters the System Access workgroup, the Activity Log now indicates the user's name. Furthermore, each login to System Access will only generate one log entry instead of two (where one entry was for System Access and the other was for the user entering the Finder). These changes do not affect log entries generated by earlier client versions and do not affect users who enter the Finder using the Command-Shift-Esc key combination.
- A problem where the workstation would not respond for long periods of time after checking the workstation out and logging back in has been fixed.
- Blank passwords are not allowed when a user changes his or her own password.
- The progress bar is updated properly when importing users.
- A problem causing the "Enforce file level security" checkbox not to update properly when multiple records were selected has been fixed.
- Because drop boxes are not supported while a computer is checked out, a workstation will no longer attempt to create drop boxes when users log in.
- A problem where the user could move an item to the desktop even if the desktop was "locked" has been addressed. This problem was seen only on OS9 clients if the "File level security" option was turned off (this is the default setting.)

Known Issues in Macintosh Manager 2.2

The Connected Users report is limited to approximately 300 clients. This affects only the report that is generated; it does not affect the actual

number of simultaneous users connected to the server.

Local Preferences on Mac OS 9 Client Workstations

A new system extension introduced in Macintosh Manager 2.1.1 called MMLocalPrefs (located on the installer disk in the Macintosh Manager Parts folder) can be installed onto your Mac OS 9 client computer to enable a feature in which preferences for a logged in user are always accessed locally instead of redirected to the remote server volume. A copy of the extension must be manually installed onto every Mac OS 9 client workstation on which you want to enable the feature. It cannot be disabled on a per-user or per-workgroup basis and does nothing if installed on a Mac OS 8 workstation.

The new ability to have local preferences for Mac OS 9 workstations works in a similar fashion to what already exists today on a Mac OS 8 client workstation using Macintosh Manager and should be used when excessive network activity generated by some applications is mitigated by having the preferences accessed locally. If you use this feature, you may experience longer login and logout times because preferences are copied to the local workstation during these times. However, the exact amount of time required depends on many variables.

Because Mac OS 9 was designed for remotely directed preferences, it's possible that some applications will not behave normally. If this occurs, you should remove the MMLocalPrefs extension and restart your workstation. It is also recommended that you unlock the desktop if you have problems printing from workstations that use the MMLocalPrefs extension.

Note: The Check Out feature of Macintosh Manager does not use the new local preference feature of this version of Macintosh Manager but instead synchronizes only to the remote preferences folder. It is not recommended that you enable the Check Out feature on OS 9 client computers when you have installed the MMLocalPrefs extension.

Using the update package

If you are already using Macintosh Manager 2.0 or later on your client computers, you can use the auto-update package (instead of the Installer) to upgrade your clients to the latest version of Macintosh Manager.

To use the auto-update package, do the following:

1. Open the Macintosh Manager Installer disk image and locate the Update Package file inside the Update Package folder. Depending on the version of Macintosh Manager you are using, the name of this file may vary.

2. Copy the Update Package file to the top level of your Multi-User Items folder on the server. The Multi-User Items folder should be located inside the Macintosh Manager share point on the server.

Client workstations periodically monitor the folder for the update package. If the update package is found, the client will update the software automatically when the client workstation is at the login screen. After the software is updated, the client workstation will restart automatically.

After all your clients have been updated, it is recommended that you remove the update package file to prevent your clients from unnecessarily accessing the server.

System requirements

Macintosh Manager 2.2 administration software requires a computer with:

- Mac OS 9.2.2 or Mac OS X
- At least 64 MB of RAM

Macintosh Manager 2.2 client software requires a computer with:

- Mac OS 8.1 through 9.2.2

AppleShare Client software:

- AppleShare Client 3.8.7 requires a 68K computer running Mac OS 8.1 to 8.5
- AppleShare Client 3.8.8 requires a PPC computer running Mac OS 8.1 or later

AppleScript Studio: Applications Using New Templates Won‘t Work on Earlier Versions of Mac OS X

Newly created AppleScript Studio applications built using AppleScript Studio 1.2 templates in Mac OS X 10.2 will not work on earlier versions of Mac OS X. This document describes how to correct this compatibility issue.
This article has been archived and is no longer updated by Apple.

Symptom

Newly created AppleScript Studio applications built using AppleScript Studio 1.2 templates in Mac OS X 10.2 won't work on earlier versions of Mac OS X.

Solution

The function call `ASKInitialize` in `main.m`, is only present in the Mac OS X 10.2 version of AppleScriptKit, so AppleScript Studio applications won't work on earlier versions of Mac OS X. A new version of `main.m` is provided below. Use this version to replace the contents of your existing `main.m` file. This changed versions of `main.m` checks for the existence of the function, then conditionally calls the `ASKInitalize` function.

`main.m` is normally located in the Other Sources folder, from the Files view of your project in Project Builder.

1. Copy the contents of `main.m` in this document, replacing the contents of your existing `main.m` file.
2. Replace the contents of main.m in the Project Templates folder, so all new projects created use the new version of main.m. Project Builder uses the templates when creating new projects.

Note: Previous applications built using prior versions of the AppleScript Studio templates will compile and work on computers using Mac OS X 10.1 through Mac OS X 10.2 when recompiled using the Mac OS X 10.2 development tools. However, some of the new Mac OS X 10.2 features cannot be used since an older version of `main.m` is used.

Location of main.m

You can find the `main.m` files in the following directories:

```
/Developer/ProjectBuilder Extras/Project Templates/Application/AppleScript Application
```

```
/Developer/ProjectBuilder Extras/Project Templates/Application/AppleScript Document-based Application
```

```
/Developer/ProjectBuilder Extras/Project Templates/Application/AppleScript Droplet
```

`main.m` will be changed in the next release of the developer tools.

main.m (new modified version)

```
#import <mach-o/dyld.h>

extern int NSApplicationMain(int argc, const char *argv[]);

int main(int argc, const char *argv[])
{
 if (NSIsSymbolNameDefined("_ASKInitialize"))
 {
  NSSymbol *symbol = NSLookupAndBindSymbol("_ASKInitialize");
  if (symbol)
  {
   void (*initializeASKFunc)(void) = NSAddressOfSymbol(symbol);
   if (initializeASKFunc)
   {
    initializeASKFunc();
   }
  }
 }

      return NSApplicationMain(argc, argv);
}
```

Final Cut Pro: Panasonic Digital Camera Compatibility

This document provides a compatibility chart of Panasonic consumer and professional digital cameras with Final Cut Pro 4.

This article has been archived and is no longer updated by Apple.

This is document does not contain a full list of qualified devices, only additional information on certain models. A complete list of qualified devices for the current version of Final Cut Pro can be found at the Apple web site (http://www.apple.com/finalcutpro/qualification.html). For a complete list for Final Cut Pro 3 see document 93261 "**Final Cut Pro 3: Camera Compatibility Information**."

For additional assistance with Panasonic digital cameras, see the Panasonic web site.

Panasonic Products: (**http://www.panasonic.com/**)

Panasonic Qualified DV Camcorders and VTRs

NTSC

Model	Device Protocol	Description and Notes
AG-DV2000	FireWire	
AG-DVX100	FireWire	This camera needs the DVX-100 Audio Sync Tool to ensure audio/video sync during capture. The script is included on the Final Cut Pro installer and updater DVDs. Once installed, locate the folder on the DVD called "Extras" and you will find "DVX-100 Audio Sync Tool". Drag the file into the Final Cut Pro Plugins folder before launching Final Cut Pro. This script should not be installed when using other DV devices, unless specified.
AJ-D250	FireWire Basic	The AJ-D250 requires a software upgrade to support the optional FireWire (IEEE 1394) interface. All VTRs shipped after September 2000 include this software upgrade. If you have an older deck, Panasonic will update the software for a flat fee of $150 at an authorized service center. Please contact Panasonic for additional details. The AJ-D250 will not accept DV video unless the sequence's audio is set to 48 kHz.
PV-DV100	FireWire Basic	This camera needs the DV Tuner 1 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro. These are included with Final Cut Pro installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 1" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should **not** be installed when using other DV devices, unless specified. When editing to tape: The sequence comes in on time with the sequence starting 22 frames late. Needs CMP Overide and Tuner 1.
PV-DV200	FireWire Basic	This camera needs the DV Tuner 1 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro. These are included with Final Cut Pro installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 1" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should **not** be installed when using other DV devices, unless specified.

PV-DV400	FireWire Basic	This camera needs the DV Tuner 1 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro. These are included with Final Cut Pro installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 1" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should **not** be installed when using other DV devices, unless specified. When editing to tape: The sequence comes in on time with the sequence starting 22 frames late.
PV-DV600	FireWire Basic	This camera needs the DV Tuner 1 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro. These are included with Final Cut Pro installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 1" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should **not** be installed when using other DV devices, unless specified.
PV-DV800	FireWire Basic	This camera needs the DV Tuner 1 and CMP Override Scripts to optimize device control over FireWire with Final Cut Pro. These are included with Final Cut Pro installer and updater CDs. Once installed, locate the folder on the CD called "Extras" and you will find "DV Tuner 1" and "CMP Override". Drag these two files into the Final Cut Pro Plugins folder before launching Final Cut Pro. These Scripts should **not** be installed when using other DV devices, unless specified. When editing to tape: The sequence comes in on time with the sequence starting 22 frames late.

Internal Modems: How To Determine Model Installed

This document describes how to determine which modem is installed in your computer.
This article has been archived and is no longer updated by Apple.

How to Determine Modem Installed

1. Open a modem terminal window

Note: Detailed instructions for opening a modem terminal window are provided in the Section titled **Using AT Commands in Mac OS 9**, and **Using AT Commands in Mac OS X** in this document.

2. Type ATI12 in the terminal
The modem responds with one of three response codes responses depending on which modem is installed.

3. Look up the response code in the table below to determine which modem is installed in your computer.

Modem Response	Modem Installed	AT Commands Manual	Get Manual
S1	Internal Comm Modem	AT Commands	
D1	Internal USB Modem	AT Commands for the Apple Internal USB Modem	
Error	Earlier internal Modem	No specific manual available. If you need to use AT Commands with this modem, download and use the Internal Comm Modem manual; AT Commands. A few commands in this manual will not work with this type of modem, but most will.	

Using AT Commands in Mac OS 9

1. Open the Modem control panel.
Choose Null Modem 9600 from the Modem menu.

2. Close the Modem control panel.
A save dialog appears.

3. Save the changes to the Modem control panel.

4. Open Remote Access control panel.

5. Click Options.

6. Click the Protocol tab.

7. Select Connect to a command-line host:
If Use terminal window is not selected, also select that option.

8. Click OK

9. Enter any number or letter into the number and password area of the Remote Access control panel.
This enables the Connect button.

10. Click Connect.
A modem terminal window appears.

11. Type ATI12 into the terminal, then press return.

The modem result code is returned.

Using AT Commands in Mac OS X

The process for checking the country code under Mac OS X is similar to Mac OS 9.

1. Network system preference.
2. Click the Modem tab.
3. Choose Null Modem 9600 from the Modem menu.

4. Click the PPP tab in the Network system preference.
5. Click PPP options.
6. Select Connect using a terminal window (command line)
7. Click OK

8. Enter any number or letter into the number and password area of the Remote Access control panel.
9. Either open Internet Connect and click connect, or if the Modem status is available in the menu bar, choose connect.
A modem terminal window opens.
10. Type ATI12 into the terminal, then press return.
The modem result code is returned.

Published Date: Feb 20, 2012

Mac OS X Server 10.2 or earlier: How to Set Up NAT

Mac OS X has a preference pane that allows you to set up Internet Sharing, generally referred to as NAT (Network Address Translation), while Mac OS X Server does not. This document describes how to set up NAT using Mac OS X Server version 10.2 or earlier. When using Mac OS X Server 10.3 or later, use the options available in Server Admin to set this up.
This article has been archived and is no longer updated by Apple.
This document discusses advanced configuration of Mac OS X Server, and expects some basic familiarity with the BSD UNIX fundamentals of Mac OS X Server.

The easiest way to set up NAT is to create and run a simple shell script like the one listed in the script section of this document. If you are not familiar with creating and running shell scripts, you may wish to consider looking into third-party tools to configure NAT.

In addition to enabling NAT, you should enable DHCP on the interface you are sharing. You can use Server Settings/Server Admin to set up DHCP. Refer to Ch. 11 of the Admin Guide for more information on setting up DHCP.

DISCLAIMER

THIS EXAMPLE IS PROVIDED "AS IS" AND WITHOUT WARRANTY, EXPRESS OR IMPLIED. APPLE SPECIFICALLY DISCLAIMS ANY IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. IN NO EVENT WILL APPLE BE LIABLE FOR ANY DAMAGES, INCLUDING BUT NOT LIMITED TO ANY LOST PROFITS, LOST SAVINGS OR ANY INCIDENTAL OR CONSEQUENTIAL DAMAGES, WHETHER RESULTING FROM IMPAIRED OR LOST DATA, SOFTWARE OR COMPUTER FAILURE OR ANY OTHER CAUSE, EVEN IF APPLE IS ADVISED OF THE POSSIBILITY OF SUCH DAMAGES, OR FOR ANY OTHER CLAIM BY CUSTOMER OR FOR ANY THIRD-PARTY CLAIM.

Shell Script

```
#!/bin/sh

/usr/sbin/natd -interface en0

/sbin/ipfw -f flush

/sbin/ipfw add divert natd all from any to any via en0

/sbin/ipfw add pass all from any to any
```

This script assumes the built-in Ethernet port (en0) is connected to the Internet, and the additional port (en1) is connected to the private networks. If you are using more ports, or are not sure which port has which identifier, type this command in the Terminal window:

```
ifconfig -a
```

The ifconfig command provides information on which ports are connected to which networks.

For more information on what the flags for natd in the script do, see the man page for natd. Using additional flags you can enable port forwarding and create other more advanced configurations.

Important: Since ipfw is used in the shell script, you should not use Server Setting's IP Firewall. Since the IP Firewall also uses ipfw, it will conflict with the shell script, and either disable NAT, or be ignored.

Hostconfig File

The file /etc/hostconfig needs to be changed to enable NAT. You should edit this file and change the following:

```
IPFORWARDING=-NO-
```

to

```
IPFORWARDING=-YES-
```

Creating a Startup Item

A NAT shell script is something that you may want to have run each time the Mac OS X Server starts up. For additional information on creating a startup item in Mac OS X Server, see the Apple developer Web site:

(http://developer.apple.com/documentation/MacOSX/Conceptual/BPSystemStartup/index.html)

Important: AppleCare does not offer any type of free technical support on setting up NAT on the command line or creating Startup Items. Contract based support for setting up NAT, creating Startup Items, and creating shell scripts is only included with Mac OS X Server Software

Support (http://www.apple.com/support/products/).

PowerBook G4 (DVI): Hard Drive Makes Clicking Sound

Some internal 60 GB hard drives may make an audible clicking or "ticking" sound during frequent disk access.
This article has been archived and is no longer updated by Apple.

Symptom

Some internal 60 GB hard drives may make an audible clicking or "ticking" sound when the disk is accessed frequently.

Solution

This noise is normal and the drive is operating properly. While the noise is intermittent, it has no functional effect on the drive, and no repair or service is needed.

Published Date: Feb 20, 2012

Mac OS X Server 10.2: How to Set Up Print Load Balancing Using CUPS

This document describes how to set up print load balancing using the Common UNIX Printing System (CUPS) with Mac OS X Server 10.2.
This article has been archived and is no longer updated by Apple.

What is CUPS?

Common UNIX Printing System is based on Internet Printing Protocols (IPP) and works with PostScript and non-PostScript printers. A CUPS printer "class" is a virtual "queue". Its main purpose is to send print jobs to other print queues.

Although not a default feature of Mac OS X Server, a CUPS printer "class" may be configured to distribute print jobs among many printers balancing the print load across multiple printers. **Note:** Apple does not offer technical support for CUPS.

Setting up a CUPS printer class using Mac OS X Server

1. Create individual queues for each printer.

Note: These queues do not need to be shared in Server Settings since they will be shared in the printer class you are creating.

2. Open a Web browser locally on the server since CUPS by default does not allow remote web administration.

3. Go to the CUPS Web-admin site (http://127.0.0.1:631/).

4. Click "Do Administration Tasks".

5. Click Classes.

6. Click Add Class. The Class admin page appears.

7. Enter a name for the class (and optional location and description).

Note: Spaces are not allowed for class names.

Description is used as the queue name, so it helps to keep the description simple.
Location is the text that appears in Print Center on the Mac OS X 10.2 client.

8. Click Continue. The Class members page appears.

9. Select one or more of the printers in the list add them to the class.

10. Click Continue. The status page appears indicating if the class was added properly.

11. Use Server Settings to enable sharing for the printer class, which appears as another PostScript queue, and to set the sharing name and other Print Service attributes.

Notes about using CUPS

- If all the queues added to the class represent PostScript printers, then the class itself appears like another PostScript print queue. This queue can be shared in the Server Settings like an individual print queue.
- You can hold/release the class as a whole or hold/release individual queues attached to the class. Holding the class by itself does not actually hold any of the queues, it just stops jobs from being forwarded to the queues. Once a job is forwarded it falls under the control of the queue that's doing the actual printing (a subtle but important distinction). CUPS performs load balancing and determines which print queue to forward the job to.
- If one or more of the class's queues are held, the jobs are parceled out to the remaining active (non-held) queues. A class can be put on hold to temporarily stop jobs from being forwarded, regardless of hold state of each individual print queue. In this case, the class acts like a queue and maintains its own job list until released.

Additional information

You can get more information about CUPS by clicking Help on the CUPS Web-admin page.

The Common UNIX Printing System, CUPS, and the CUPS logo are the trademark property of Easy Software Products.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's

recommendation or endorsement. Please contact the vendor for additional information.

PowerBook G3 (Bronze Keyboard): USB MIDI Interfaces Not Recognized After Sleep in Mac OS X

When you wake a PowerBook G3 (Bronze Keyboard) computer from sleep any MIDI interfaces connected to the computer will not be recognized.

This article has been archived and is no longer updated by Apple.

Symptom

The USB interface is no longer recognized by audio programs, and the interface appears multiple times in Audio MIDI Setup.

Solution

- Avoid letting the PowerBook sleep when USB MIDI interfaces are connected

  or
- Disconnect and reconnect the USB MIDI interface after waking from sleep

Published Date: Feb 20, 2012

Mac OS X 10.2: FireWire Target Disk Mode requires hot plugging for some computers

When connecting one Macintosh computer to another using FireWire Target Disk Mode, some computers may not appear until the FireWire cable is disconnected and connected again.
This article has been archived and is no longer updated by Apple.

Symptom

The computer in FireWire Target Disk Mode (the "target") does not appear on the host computer.

Solution

Connect the FireWire cable to the target computer after starting it up in FireWire Target Disk Mode.

If the cable was already connected, unplugging it from either computer and plugging it back in should allow the target computer's hard disk to appear on the host.

If the target computer is a Power Macintosh G4, a more current boot ROM may be available. First, determine what version of the boot ROM is on the target computer using Apple System Profiler.

The boot ROM version is listed in the Hardware Overview section.

Tip: Search the Knowledge Base to see if a more recent firmware version is available, and if so download and install it.

Mac OS X 10.2: Startup Delay When DCHP Server Uses 127.0.0.1/local as NetInfo Parent

There is a delay during startup if the DHCP server is configured to send 127.0.0.1 and local as the IP address and tag of the NetInfo parent system, and the client is set to bind to NetInfo via DHCP. There are also system.log entries from lookupd stating the RPC connection to 127.0.0.1 timed out.

This article has been archived and is no longer updated by Apple.

Symptom

There is a noticeable delay at startup. The progress window displays messages like "waiting for application services", or other similar messages.

Solution

Configure the DHCP server to give the correct information--or none if not using NetInfo parents.

To set the Mac OS X Server's DHCP Server do the following:

1. Open Server Settings or Server Admin depending on which version of the server is being used.
2. Click the Network tab.
3. Click the DHCP icon and select Configure DHCP/NetBoot from the pop-up menu.
4. Click the Subnets tab.
5. Double-click subnet to edit the subnet information.
6. Click the NetInfo tab.
7. Delete all information if not using NetInfo parents.
8. Click Save.

For third-party servers, this information is returned using DHCP options 112 and 113. Refer to the documentation provided with the third-party server for configuration information

You can also disable binding on the client if not using NetInfo parents.

1. Open the Directory Access application (/Applications/Utilities/)
2. Click the lock icon to authenticate if necessary.
3. Deselect NetInfo.
4. Click Apply.

Mac OS X: Mail - Where Attachments Are Saved

This document describes where attachments are stored by the Mac OS X application Mail.
This article has been archived and is no longer updated by Apple.
In Apple's Mail application, files attached, or enclosed in email messages are stored as part of the messages. When a message is stored on an email server, the attachment, or enclosure is also stored on the email server. However, the attachment or enclosure may temporarily be stored on your computer's hard disk.

Since attachments are part of the message itself, if the message is stored on your computer's hard disk, then the it is also on the hard disk. If you delete the message, all of its attachments are also deleted.

Other email programs may use the downloads folder you set in the Web tab of the Internet pane in System Preferences. Mail does not use the downloads folder for attachments. However, you can save files there by pressing Control and clicking the enclosure.

For information on how to save an attachment in Mail, see document 107150 "**Mac OS X 10.2: How to Save Attachments in Mail**".

Published Date: Feb 19, 2012

Mac OS X: Mail - How to Send a Message at a Later Time

This document describes how to send an email message at a later time using the Mac OS X application Mail.
This article has been archived and is no longer updated by Apple.
Some email clients can queue messages for later delivery without trying to send them. This is useful if you do not have a constant connection to the Internet. The Mac OS X application Mail does not have a single-button way to do this. The following alternatives may work for you.

- Send the message immediately. If you have a modem connection, this may cause your modem to dial.
- Send the message when your computer is not connected to a network. After a slight delay, an alert box with this message appears:

  "Error This message could not be delivered and will remain in your Outbox until it can be delivered. The server "<name of mail server>" can not be contacted on port 25."

Figure 1 Cannot deliver message alert

Click Close Window. The message will be placed in your Outbox.

Published Date: Feb 19, 2012

WebObjects 5.1: How to Improve Performance of IIS Adaptor on Microsoft Windows

Under certain conditions, the IIS adaptor on Microsoft Windows experiences a degradation in performance. This document describes the issue in detail and provides source code that can be used to prevent it.
This article has been archived and is no longer updated by Apple.

Symptom

When using the IIS adaptor, the performance degrades under certain conditions. These conditions cause large amounts of memory to be allocated for each request resulting in poor response times and OutOfMemoryExceptions.

Note: This happens whenever the ISAPI adaptor is used, even when your applications are used on another computer with a different operating system.

Solution

- Upgrade to WebObjects 5.2.
- Use the code patch in this section to workaround the issue if you are using WebObjects 5.1 through 5.1.3.

Important: This patch is for Microsoft Windows only. Do not use this patch on other platforms.

How to apply the code patch

1. Locate the source code.
   Go to the directory and locate the Adaptor subproject at the following path:
   `$NEXT_ROOT/Developer/Examples/WebObjects/Source/Adaptors/Adaptor`
2. In the Adaptor subproject, locate the files **`request.h`** and **`request.c`**
3. Make the following code modifications to the files **`request.h`** and **`request.c`**

File request.h

In **`request.h`**, search for **`#include "WOURLCUtilities.h"`** and add the following line below it:

```
#include "wastring.h"
```

File request.c

In **`request.c`**, search for the beginning of the method '**`int req_sendRequest`**' (around line 217). Be careful not to delete this original method '**`int req_sendRequest`**'. Add the following code block before the original method '**`int req_sendRequest`**':

```
#ifdef WIN32
static void req_appendHeader(const char *key, const char *val, String *headers) {
  int valLength = strlen(val);
  while (val[valLength - 1] == '\\r' || val[valLength - 1] == '\\n') {
    valLength--;
  }
  str_append(headers, key);
  str_appendLiteral(headers, ": ");
  str_appendLength(headers, val, valLength);
  str_appendLiteral(headers, "\\r\\n");
}

int req_sendRequest(HTTPRequest *req, net_fd socket) {
  struct iovec *buffers;
  int bufferCount, result;
  String *headersString;

  buffers = WOMALLOC(3 * sizeof(struct iovec));

  headersString = str_create(req->request_str, 0);
  if (headersString) {
    st_perform(req->headers, (st_perform_callback)req_appendHeader, headersString);
  }
  buffers[0].iov_base = headersString->text;
  buffers[0].iov_len = headersString->length;
```

```
  buffers[1].iov_base = "\\r\\n";
  buffers[1].iov_len = 2;
  bufferCount = 2;
  if (req->content_length > 0) {
    bufferCount++;
    buffers[2].iov_base = req->content;
    buffers[2].iov_len = req->content_length;
  }
  result = transport->sendBuffers(socket, buffers, bufferCount);
  str_free(headersString);
  WOFREE(buffers);
  if (result == 0)
    result = transport->flush_connection(socket);
  else
    WOLog(WO_ERR, "error sending request");

  return result;
}
#else
// End of the code to be added to request.c
```

`After the #else` comes the original **`req_sendRequest`** method.

Go to the end of this method and insert **`#endif`** on the next line after the closing brace.

4. Compile the adaptor.

The makefile expects the OS environment variable to be either empty or contain the string 'WINDOWS'.

You can explicitly set the OS variable in a Bourne shell using the following:

```
cd $NEXT_ROOT/Developer/Examples/WebObjects/Source/Adaptors
set OS=WINDOWS
make clean
make
make IIS
```

Notes:

- The first **`make`** operation produces a file **`WebObjects.exe`** in the directory **`$NEXT_ROOT/Developer/Examples/WebObjects/Source/Adaptors/CGI`**
- The second **`make IIS`** operation produces the file **`WebObjects.dll`** in the directory **`$NEXT_ROOT/Developer/Examples/WebObjects/Source/Adaptors/IIS`**
- A warning appears stating **setupIOVec** is defined but not used. This warning can be ignored.

5. Install the modified adaptor.

After compilation, the two files **WebObjects.EXE** (located in **`$NEXT_ROOT/Developer/Examples/WebObjects/Source/Adaptors/CGI`**) and **WebObjects.DLL** (located in **`$NEXT_ROOT/Developer/Examples/WebObjects/Source/Adaptors/IIS`**) should be copied to the proper location. Change **`c:\\inetpub`** to match your system.

In a Bourne shell, do the following:

```
cd $NEXT_ROOT/Developer/Examples/WebObjects/Source/Adaptors

net stop w3svc

cp cgi/webobjects.exe c:/inetpub/scripts

cp iis/webobjects.dll c:/inetpub/scripts

net start w3svc
```

Stopping IIS before copying prevents possible sharing violations for the ISAPI adaptor since you cannot overwrite the file if it has already been loaded by IIS.

AppleWorks 6: How to Use Text-to-Speech

This document describes how to use the Text-to-Speech feature in AppleWorks 6.

This article has been archived and is no longer updated by Apple.

How to Use Text-to-Speech with AppleWorks 6

1. Install Text-to-Speech, if it is not already installed.

    Notes
    - Text-to-Speech is installed by default in Mac OS X.
    - You must install Text-to-Speech in Mac OS 9 and earlier. Use the Custom installation option of the Mac OS Installer to install Text-to-Speech. Additional information on performing a custom installation is available in technical document 31288, "**Mac OS 9: Installing or Removing Individual Components**".

2. Add the Text-to-Speech button to the AppleWorks button bar.

    1. Open AppleWorks.
    2. Create a new Word Processing document.
    3. Control-click the Button Bar. A contextual menu appears.
    4. Choose Customize Button Bar. The Customize Button Bar dialog appears.
    5. Drag the Speak Text button from the Word Processing buttons to the Button Bar.

    Note: You may have to click the disclosure triangle next to Word Processing for the Speak Text button to appear.

    6. Click Done.

How to Speak Text

1. Select the text you want to speak in the Word Processing document.
2. Click the Speak Text button.
3. Click the Speak Text button again to stop the speech.

How to Change the Voice Used for Speech

Mac OS X

1. Open the Speech pane in System Preferences.
2. Click the Default Voice tab.
3. Select the voice you want to use from the voices.

Mac OS 9 and earlier

1. Open the Speech control panel.
2. Select Voice from the Options pop-up menu.
3. Select the voice you want to use from the voice pop-up menu.

Published Date: Feb 19, 2012

WebObjects 5.2: How to Correct the PATH Environment Variable in Windows

This document describes the steps necessary to correct the PATH environment variable when using WebObjects on the Windows 2000 Platform.
This article has been archived and is no longer updated by Apple.

Symptom

There are two known issues when WebObjects is installed on Microsoft Windows 2000.

1. PATH length is exceeded during the installation process.
The maximum length of 255 characters is exceeded resulting in the error message:
"The Path environment variable > 255 chars. This may prevent WebObjects from functioning correctly. The entire variable has been saved and can be edited in the registry at HKEY_LOCAL_MACHINE\\SYSTEM\\CurrentControlSet\\Control\\Session Manager\\Environment."

2. Location of JDK in the PATH environment variable.
Project Builder will not properly start an application if the JDK path is placed before the Windows system path.

While the Project Builder Panel displays:

> Starting MyApplication.woa
> Finished running MyApplication.woa

MyApplication.woa never starts.

Solution

Issue 1: Exceeding PATH length during installation

1. The WebObjects Installer always prepends the Apple paths to the existing PATH variable. This can result in the Windows system directories getting pushed out of the PATH, and the PATH length may exceed the maximum length of 255 characters.

2. With each repeated installation of WebObjects 5.2, the WebObjects Installer will keep prepending the Apple paths to the existing PATH variable. The consequence is that the PATH variable may contain many duplicate entries, and may exceed the maximum length of 255 characters.

Issue 2: JDK placement in the PATH

WebObjects applications will not work properly on Windows if the JDK path is placed before the Windows system paths.

For example, the following PATH causes issues such as preventing a WebObjects application from running inside ProjectBuilder:

```
%JAVA_HOME%\\bin;C:\\WINNT\\system32;C:\\WINNT;%NEXT_ROOT%\\Library\\Executables;
```

where `%JAVA_HOME%` is defined as `C:\\JDK13~1.1`

Workarounds

To work around these issues:

1. Check your PATH environment variable.
Choose Settings > Control Panel > System > Advanced > Environment Variables

2. Look at the contents of the PATH environment variable

3. Delete any duplicate entries to ensure that the maximum length is not exceeded

4. Verify that the Windows system path is placed before the JDK path.

Example, of a good working PATH:

```
%SystemRoot%\\system32;%SystemRoot%; C:\\JDK13~1.1\\bin;

%NEXT_ROOT%\\Library\\Executables;%NEXT_ROOT%\\bin;%NEXT_ROOT%\\Library\\JDK\\bin;
```

where `%SystemRoot%` is defined as `C:\\WINNT`

and `%NEXT_ROOT%` is defined as `C:\\Apple`

DVD Player: "DVD Player encountered a serious error" Alert

If an earlier version of Developer Tools is installed in Mac OS X, an alert with error 1634955892 may appear when you open DVD Player.
This article has been archived and is no longer updated by Apple.

Symptom

When you open DVD player an alert appears with this message:

> "DVD Player encountered a serious error. Unknown error. [1634955892]" appears.

Solution

Rename or remove the earlier HIServices framework installed by the Developer Tools package. To rename the framework, enter the following commands into the Terminal:

```
cd /System/Library/PrivateFrameworks/
sudo mv HIServices.framework HIServices-old.framework
```

Published Date: Feb 19, 2012

Mac OS X: Some Key Commands May Not Work with KVM Switchbox

Some special key commands may not work if your keyboard is connected to your computer through a USB "KVM" (keyboard-video-mouse) switchbox.
This article has been archived and is no longer updated by Apple.

Symptom

Holding down special key combinations at startup, or pressing certain special keys (like the Eject key) do not work when the keyboard is connected to the computer through a KVM switchbox.

Solution

Connect the keyboard directly to a USB port on the computer.

Some or all of the following startup key commands may not work, depending on the model of KVM switchbox:

- C (start up from CD)
- Option (start up to Startup Manager)
- Command-Option-P-R (reset parameter memory--PRAM)
- Command-Option-O-F (start up into Open Firmware)

In addition, the Eject key may not eject optical media, and the F12 key may function in its place.

In some cases, using a KVM switchbox may cause the computer to start up into a default 800-by 600- pixel resolution.

Mac OS X 10.2: Keyboard Shortcut May Conflict with Classic Applications

Using the keyboard shortcut Command-Option-Shift-Q immediately quits the Classic environment in Mac OS X 10.2 without warning.
This article has been archived and is no longer updated by Apple.

Symptom

Using the keyboard shortcut Command-Option-Shift-Q in Mac OS X 10.2 while using the Classic environment immediately causes the Classic environment, and any applications open it, to quit without warning.

Important: Any unsaved data in open Classic applications will be lost when the Classic environment quits.

Solution

Update to Mac OS X 10.2.5 or later for improved reliability.

You should avoid using the keyboard shortcut Command-Option-Shift Q when using Classic applications. To restart the Classic environment click Restart in the Classic preference pane.

Note: This only restarts the Classic environment, it does not restart the computer.

Final Cut Pro 3: The 3.0.4 Updater Will Not Update Final Cut Pro 3.0.2f1

This article has been archived and is no longer updated by Apple.

The Final Cut Pro 3.0.4 updater will not update some copies of Final Cut Pro 3.0.2. This is due to installing an updater of the wrong language or if the Final Cut Pro 3.0.2 software has been mistakenly labeled as version 3.0.2f1.

Symptom

When you use the Final Cut Pro 3.0.4 updater, an alert with this message appears:

> "This is not a version of Final Cut Pro which can be updated. (err 2)"

Solution

- This error can occur when running the English 3.0.4 updater over a non-English installation of Final Cut Pro. If this is the case, download and install the updater in the same language of your existing installation.
- The error can also occur if installing over versions of Final Cut Pro mistakenly labeled 3.0.2f1.

Mac OS X 10.2: How to Show Menu Bar Items

This document explains how to show additional items in the menu bar, such as displays, clock, or battery.
This article has been archived and is no longer updated by Apple.
Open the appropriate pane in System Preferences to show the following items in the menu bar. Where System Preferences is not used specific instructions are given.

- **AirPort**: In the Network pane of System Preferences, click the Airport tab, then select "Show AirPort status in menu bar".
  Note: Available only on AirPort-compatible Mac OS X computers.
- **AppleScript Script Menu**: Double-click Script Menu.menu, which is located in /Applications/AppleScript.
- **Battery:** In the Energy Saver pane of System Preferences select "Show battery status in menu bar".
  Note: Available only on portable Mac OS X computers.
- **Bluetooth**: In the Bluetooth pane's Settings tab, select "Show Bluetooth status in the menu bar".
  Note: Available only when compatible Bluetooth hardware is connected.
- **Clock**: In the Data & Time pane's Menu Bar Clock tab, select "Show the date and time in the menu bar".
- **Displays:** In the Displays pane of System Preferences, select "Show displays in menu bar".
- **Eject:** This item allows you to open or close the optical drive tray, which may be useful if you use a third-party keyboard and the F12 key does not open the tray. To show this menu bar item, do the following:
  1. Choose "Go to Folder" from the Finder's Go menu.
  2. Type or paste: /System/Library/CoreServices/Menu Extras
  3. In the Menu Extras folder, double-click "Eject.menu".
- **iChat:** In iChat, choose Preferences from the iChat menu, click Accounts, then select "Show status in menu bar".
- **IrDA**: In the Network pane of System Preferences, choose IrDA from the Show pop-up menu , click the IrDA Modem tab, then select "Show IrDA status in menu bar". If IrDA does not appear in the Show menu, select Network Port Configurations, then select IrDA.
  Note: Available only on portable Mac OS X computers that include an IrDA port.
- **Lock Screen:** In the Keychain application, choose View > Lock Screen.
- **PC Card**: This item appears in the menu bar when a compatible PC Card is present.
  Note: Available only for portable Mac OS X computers that include a PC Card slot.
- **PPP**: In the Internet Connect application, select "Show modem status in menu bar".
- **PPPoE**: In the Network pane of System Preferences, click the PPPoE tab, then select "Show PPPoE status in menu bar".
- **Volume**: In the Sound pane of System Preferences, select "Show volume in menu bar"

Note: In Mac OS X 10.2, when you locate a menu extra bundle in the Finder (as in the instructions for AppleScript and Eject above) it appears as a folder. The bundle will not open as a folder. Instead, double-clicking on the bundle will activate it.

iCal 1.0.1 - Events Displayed at Incorrect Time in Certain Time Zones

iCal 1.0.1 may display events at the wrong time depending on the time zone set in System Preferences.

This article has been archived and is no longer updated by Apple.

Symptom

The time specified in the event inspector window does not match the time used to display the event in month, day, or week view.

This issue affects computers whose selected times zones include these cities:

- Australia: all cities but Perth
- New Zealand: Wellington
- Russia: Vladivostok, Magadan, Anadyr
- United States: Honolulu and Guam

Solution

Download and install iCal 1.0.2 or later from the iCal website (http://www.apple.com/ical/).

Published Date: Oct 10, 2016

iPhoto: Page Setup Scale Percentage Does Not Affect Prints

After selecting a photo to print, changing the Scale percentage in Page Setup does not affect the printout.
This article has been archived and is no longer updated by Apple.
Selecting a photo to print, choosing Page Setup, and changing the scale percentage does not affect the printout. It still prints full page.

This happens when using:

- iPhoto 1.0 and later

iPhoto does not use Page Setup scale percentage as a means of scaling printouts.

To achieve different single page print sizes, do the following:

1. From the **File** menu, choose **Print**.

2. From the **Presets** pop-up menu, choose **Standard**.
3. From the **Style** pop-up menu, choose **Standard Prints**.
4. Select the size of the printout using Size.

Other page setup values besides scale are used. It is important to select the correct printer type and paper size within page setup for best results when printing.

Note: If you select Preview from the Print dialog, the selected photo opens in Acrobat Reader or Preview where you can change the scale percentage in Page Setup.

Published Date: Oct 10, 2016

iPod: MP3Pro Files Play at Encoded Resolution

If MP3Pro sound files are played on the iPod, they playback at the encoded resolution.
This article has been archived and is no longer updated by Apple.

Symptom

Audio files compressed using the MP3Pro compressor, play back in a lower quality from an iPod.

Solution

Neither the iPod or iTunes works with the MP3Pro format, so audio is played back at the encoded resolution, which is compatible with standard MP3 devices.

MP3Pro Background

The MP3Pro compression format allows audio files to be encoded at a lower resolution, making the .mp3 file smaller in size. However, when played back on a device, or in an application that works with MP3Pro, the sound quality is perceived to be similar to the same file encoded at a higher resolution.

For example, an MP3 file encoded at 128 kilobits per second (kbit/s) using a standard MP3 compressor, such as iTunes, might be 1.6 MB in size. However, the same file encoded at 64 kbit/s using a standard MP3 compressor might only be 820 KB. The MP3Pro format allows a file to be compressed at 64 kbit/s, yet sound like it was encoded at 128 kbit/s when played back on a MP3Pro device or application. When the same file is played back without using MP3Pro, the file plays back in a "non-Pro" format at 64 kbit/s. This means the file sounds like a standard MP3 file encoded at 64 kbit/s file without any enhancements.

Keynote 1.0: Cannot Open PowerPoint Show

This document explains the steps required to open a PowerPoint self-playing presentation, or "show".
This article has been archived and is no longer updated by Apple.

Symptom

You cannot select a PowerPoint show (a self-playing PowerPoint presentation) in the Open dialog.

Solution

PowerPoint presentations normally use a filename extension of **.ppt**. In order for Keynote to see and import the presentation properly, you must change the filename extension from **.pps** to **.ppt**.

iChat: "Unable to log in to AIM proxy" Alert

iChat can be configured to use some proxy servers, but it must be configured separately from the proxy settings in System Preferences.

This article has been archived and is no longer updated by Apple.

Symptom

When going online in iChat an alert appears with this message:

> "Unable to log in to AIM proxy. Check the proxy settings in the Accounts section of iChat preferences."

Solution

iChat can use SOCKS 4, SOCKS 5 and HTTPS proxies.

To configure iChat to use such a proxy server:

1. Choose iChat > Preferences.
2. Click Accounts.
3. Click on the Server Settings button.

Note: iChat does not work with proxy servers that require authentication (user name and password.)

Mac OS X 10.2: Streaming QuickTime Movies Do Not Preview in Finder

Selecting a QuickTime movie with streaming content in the Finder's Column view will not play a preview of the movie.
This article has been archived and is no longer updated by Apple.

Symptom

Selecting a QuickTime movie creates a 'preview' column with a movie control bar but no image in the Finder's Column view.

Solution

This occurs if the movie is a QuickTime Streaming movie. Only static QuickTime movies can be previewed in the Finder.

To view the movie, double-click the icon to open it in QuickTime player.

Published Date: Feb 19, 2012

Mac OS X 10.2: Use Grab Utility to Take Screenshots in Simple Finder

When using Simple Finder in Mac OS X 10.2, use the Grab utility instead of keyboard shortcuts to take screenshots.
This article has been archived and is no longer updated by Apple.

Symptom

Screenshots taken with keyboard shortcuts in Simple Finder are not saved in a location that is accessible to Simple Finder users.

Solution

The system administrator can allow Simple Finder users to use the Grab Utility. This utility allows Simple Finder users to save screenshots in their Documents folder.

Allowing the Grab utility for Simple Finder users

1. Log into the computer with an administrator account.
2. Open System Preferences.
3. Choose View > Accounts.
4. Select the user.
5. Click Capabilities.
6. Allow Grab in the Capabilities list. (The checkbox is under the Utilities disclosure triangle.)

Published Date: Feb 19, 2012

WebObjects: Direct Connect HTTP Server Does Not Serve All MIME Types

WebObjects applications using certain MIME types cannot serve these MIME types in Direct Connect mode. WebObjects returns the Main.wo component instead of the MIME type files when WebObjects application users try to access them.
This article has been archived and is no longer updated by Apple.

Symptom

1. Put a new MIME type file in your Web server document root.
2. Start the WebObjects application in direct connect mode on the proper port (port XXX).
3. Attempt to access the MIME file using the standard (http://localhost:XXX/MIMEfilename.yyy), where yyy is the MIME type's filename extension.

The application responds to that request by returning the main component, Main.wo.

Solution

WebObjects includes `MIME.plist` in the `JavaWebObjects.framework`, or in the `WebObjects.framework` in WebObjects 4.5.1 and earlier. The `MIME.plist` maps MIME file extensions to MIME file types. WebObjects applications in Direct Connect mode access the `MIME.plist` file, which instructs browsers how to treat data they are about to receive. The `MIME.plist` file is static and sometimes omits the MIME types that developers wish to use. Typically, new media types are introduced more frequently than WebObjects is updated. In order to use new media types, developers need to be able to introduce these new media types in their WebObjects applications.

Updating the MIME.plist

Developers can update MIME.plist with media types that are not already listed, so that WebObjects can serve the new media types. The steps for adding media types is listed in the subsections below. The example used Flash files, which are supported in WebObjects 5.2, but the steps are identical for adding other media types not listed in the `MIME.plist` file.

Developer Note: if a MIME type is missing from the MIME.plist, submit a bug report at (http://bugreport.apple.com), so the `MIME.plist` can be updated with new media types in future releases.

Adding Media Types in WebObjects 4.5.1 and Earlier on Mac OS X

These steps explain how to add support for Flash Files, but can used for other media types, too. Simply use the proper media type information in step 3.

1. Locate `/System/Library/Frameworks/WebObjects.framework/Resources/MIME.plist`
2. Either Open `MIME.plist` with a text editor **or**
Open MIME.plist with the Property List Editor application.
3. Add "swf" = "application/x-shockwave-flash" inside the braces.
Add this line between the '{' and the '}'.
4. Open the WebObjects application again, and it will serve the Flash files.

Adding Media Types in WebObjects 5.0 and later on Mac OS X

These steps explain how to add support for Flash Files, but can used for other media types, too. Simply use the proper media type information in step 3.

1. Locate `/System/Library/Frameworks/JavaWebObjects.framework/Resources/ MIME.plist`
2. Either Open `MIME.plist` with a text editor **or**
Open MIME.plist with the Property List Editor application.
3. Add "swf" = "application/x-shockwave-flash" inside the braces.
Add this line between the '{' and the '}'.

4. Open the WebObjects application again, and it will serve the Flash files.

Adding Media Types in WebObjects 4.5.1 and earlier on Microsoft Windows NT or Windows 2000

These steps explain how to add support for Flash Files, but can used for other media types, too. Simply use the proper media type information in step 3.

1. Locate `$NEXT_ROOT\\Library\\Frameworks\\WebObjects.framework\\Resources\\MIME.plist`
2. Open `MIME.plist` with a text editor
3. Add "swf" = "application/x-shockwave-flash" inside the braces.
Add this line between the '{' and the '}'.
4. Open the WebObjects application again, and it will serve the Flash files.

Adding Media Types in WebObjects 5.0 and Later on Microsoft Windows NT or Windows 2000

1. Locate $NEXT_ROOT\\Library\\Frameworks\\JavaWebObjects.framework\\Resources\\MIME.p list
2. Open `MIME.plist` with a text editor
3. Add "swf" = "application/x-shockwave-flash" inside the braces.
Add this line between the '{' and the '}'.
4. Open the WebObjects application again, and it will serve the Flash files.

Published Date: Feb 19, 2012

Mac OS X: QuarkXPress 5.01 Updater Slow to Finish

Quark has reported that using the QuarkXPress 5.01 Updater on a volume that contains Mac OS X may take up to two hours to complete (http://www.quark.com/products/xpress/501knownissues.html). This document offers a workaround.
This article has been archived and is no longer updated by Apple.

Symptom

The QuarkXPress 5.01 takes one or more hours to complete when updating the QuarkXPress application on a volume that contains many hundreds of other files and folders. While not specific to Mac OS X, this includes volumes on which Mac OS X is installed. The slowdown occurs whether the update is installed in Classic or in Mac OS 9.

Solution

Move the folder containing the QuarkXPress application to a different location on the volume.

1. Create a new folder at the root of the volume.
2. Give the folder a name such as " Applications" which begins with a space character.

   Important: Do not use quotations around the folder name.
3. Drag the folder containing the QuarkXPress application into the newly-created folder.
4. Open the QuarkXPress 5.01 Updater. Follow the update instructions provided by Quark, Inc.
5. After QuarkXPress is updated, drag the folder containing the QuarkXPress application where you'd like to keep it.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X: Grab Service Commands Dimmed in Finder

The Grab service does not allow you to take pictures from the Finder.
This article has been archived and is no longer updated by Apple.

Symptom

Grab is listed in Finder > Services, but all of its commands are dimmed.

Solution

Use the Grab application (/Applications/Utilities) to take pictures of windows or your desktop.

You can also use the keyboard shortcut Command-Shift-4 (selected regions), Command-Shift-3 (entire desktop) to save a picture on the desktop as a PDF file.

About Grab Services

Grab services are available in applications that support services and can accept the result of the service. In the case of the Grab service, TextEdit can use Grab when a document is open, since there is a place to put the resulting image. In the case of the Finder, it has no place to put the result without creating a new document, something a service is not able to do.
Published Date: Feb 19, 2012

Mac OS X 10.2.3: Read Before You Install

This document contains the contents of the Read Before You Install PDF file contained on the Mac OS X 10.2.3 DVD included with the iMac (17-inch 1 GHz), PowerBook G4 (12-inch), PowerBook G4 (17-inch), and Power Macintosh G4 (FW 800) computers.
This article has been archived and is no longer updated by Apple.

Read Before You Install

Use the Software Install and Restore DVD that came with your computer to install Mac OS X, Classic Support, or the applications that came with your computer. You can also use the DVD to restore your computer to its original factory settings.

If installing software onto a portable computer, it is advisable that your system be powered by the power adapter during the process to ensure an uninterrupted installation. If you need to restore the computer to original factory settings, back up all essential files prior to beginning the installation.

To install Mac OS X

1. Insert the Software Install and Restore DVD that came with your computer.
2. Double-click the Install Mac OS X icon.
3. Follow the onscreen instructions.
4. Select the destination disk for installation, and then click Options.
5. Continue following the onscreen instructions. If you would like to restore your computer to its original factory settings, select Erase and Install. In most cases, choose Mac OS Extended (HFS Plus).

To continue restoring your computer to the original factory settings, follow the below instructions below for installing Classic Support and applications.

Note: To run Mac OS 9 applications in the Mac OS X Classic environment, you will need to reinstall Classic Support. See the instructions below for installing Classic Support. To install Classic Support or the applications that came with your computer.

1. Insert the Software Install and Restore DVD that came with your computer.
2. Double-click the Install Applications & Classic Support icon.
3. Follow the onscreen instructions.

To restore the computer to the original factory settings, select Restore All.

Note: iCal, iPhoto, iTunes, iChat, and iMovie are part of Mac OS X. To install them, you must follow the instructions for installing Mac OS X.

Quitting the Installer

If you need to quit the Installer before the installation process is complete, choose Quit from the Installer menu and click Restart, then hold down the mouse or trackpad button to eject the Software Install and Restore DVD. You may be able to eject the DVD by pressing the eject button on a tray-loading optical drive or the Media Eject key on the keyboard. Your computer restarts using your current startup disk.

Note: If you have already clicked Upgrade or Install, wait until installation finishes. Erasing and formatting your disk

When you install Mac OS X, you can erase the destination disk. In the "Select a Destination" pane of the Installer, click the Options button. Select Erase and Install and then choose a format. In most cases, choose Mac OS Extended (HFS Plus).

You can also divide your hard disk into several partitions before you install Mac OS X. In the Installer menu, choose Open Disk Utility and click Partition. Partitioning the disk erases the entire hard disk, so be sure to back up your files first. To install Classic Support or the applications that came with your computer onto a specific partition, the partition must contain Mac OS X. You must start up the computer from that partition and then run the installation process.

Important: Do not choose UNIX File System (UFS) as the format for the destination disk unless you need to work with this format. If you choose UNIX File System, you must install Mac OS X, Classic Support and your Mac OS 9 applications on a Mac OS Extended format disk to use them with the Classic environment.

Upgrading your applications and other software

Use Software Update to download and install the latest software versions, drivers, and other enhancements from Apple. If you are connected to

the Internet, Software Update automatically alerts you when an update is available. You can also check for updates manually by choosing System Preferences from the Apple menu and then clicking Software Update.

For best results with Mac OS X, upgrade your applications to versions that are built for Mac OS X. Check the Mac OS X website for information about available Mac OS X applications:

- http://www.apple.com/macosx/

You should also check with developers for the latest versions of your applications.

Mac OS X Server 10.2.3: CUPS Print Server Can Sometimes Prevent Queue Processing

In certain circumstances, especially in environments with high print volumes, a condition can occur that prevents the CUPS Print Server from processing queued print jobs.
This article has been archived and is no longer updated by Apple.

Symptom

1. Print jobs do not process.

2. You may see an error such as this one in the CUPS error log:

W [15/Jan/2003:11:09:49 -0600] Possible DoS attack - more than 10 clients connecting from localhost!

Solution

1. Using Text Edit or command-line editor, make the following modifications to the **cupsd.conf** file located in: `/etc/cups/cupsd.conf`

Old cupsd.conf file:

```
#
# MaxClients: controls the maximum number of simultaneous clients that
# will be handled.  Defaults to 100.
#

# MaxClients 100
```

New cupsd.config file:

```
#
# MaxClients: controls the maximum number of simultaneous clients that
# will be handled. Defaults to 100.
#
MaxClients 500
MaxClientsPerHost 100
```

2. Restart the server after making the changes to ensure all configuration files are properly read and all related services are properly started.

Published Date: Oct 10, 2016

Power Mac G4 (FW 800): No Sound After Restart

If audio is set to maximum, there is no sound after you restart the Power Mac G4 (FW 800) computer.
This article has been archived and is no longer updated by Apple.

Symptom

The computer does not make any sound after it is restarted.

Solution

1. Mute the sound by pressing and releasing the mute key on the keyboard.
2. Turn the sound back on by pressing and releasing the mute key on the keyboard.

Note: Setting the audio level to something other than the maximum setting prevents this issue from occurring.

Published Date: Oct 10, 2016

Xserve (Slot Load), Xserve G5: Using the System Identifier button to activate a boot menu

Learn how to use the System Identifier button to activate a boot menu.
This article has been archived and is no longer updated by Apple.
You can use the system identifier button on the server's front panel to initiate a limited number of firmware commands to the system without connecting a keyboard or monitor to the server (Headless Booting). You enter each command with a combination of the system identifier button and a specific light on the front panel. The steps are listed below.

1. With the power off, hold in the system identifier button while you press the power button.

2. Continue holding in the system identifier button until the top row of blue lights blinks sequentially.
This indicates that the Front Panel Mode has been activated.

3. Release the system identifier button. The rightmost light in the bottom row turns on. Press the button to light the next light in the bottom row, moving from right to left. Press the button again to change lights. Press and release the System Identifier button one or more times to move the light from right to left in the bottom row of LEDs.

The lights in the bottom row indicate (from right to left) as follows. Rows in grey are available on Xserve G5, but not on previous models of Xserve.

LED	Description
Light 1 (far right):	Start up from system disk in CD drive (also, eject any disc in the optical drive).
Light 2:	Start up from a network server (NetBoot).
Light 3:	Start up from the internal drive (leftmost, if more than one drive).
Light 4:	Bypass the current startup disk and start up from any other available startup disk.
Light 5:	Begin Target Disk Mode (all drives, including the optical drive, will appear). Note: Drives connected to a Hardware RAID card or Fibre Channel card will not appear.
Light 6:	Restore the system's default settings (reset NVRAM).
Light 7:	Enter Open Firmware (if no keyboard is connected, this option will automatically redirect Open Firmware input and output to the serial port).
Light 8: (Xserve G5 only)	Initiate diagnostics mode.

1. When the light for the action you want is on, hold in the system identifier button for at least 2 seconds, until all lights in the top row are on.

Note: If the button is released during the countdown, the Select Mode is entered.

2. Release the button.

The top row of LEDs will light across from left to right, then all LEDs will turn off and the selected function will start. If the selected function was not successful in starting up, all LEDs will flash.

Important: To use the Front Panel Mode, turn off Open Firmware Security. (Unlock the server on the front of the Xserve.) When Open Firmware Security is on, the Front Panel Mode is disabled and is indicated by all LEDs displaying short flashes, after which the server continues with the normal startup process.

Using a Keyboard to perform firmware commands

If a keyboard is connected, you can hold down various key combinations during system startup to perform the same firmware options listed in the previous section of this document. Again, a row in grey indicates a light that is available only on the Xserve G5, not previous models.

LED	Description

Light 1 (far right):	C
Light 2:	N
Light 3:	D
Light 4:	Command-Shift-Option-Delete
Light 5:	T
Light 6:	Command-Option-P-R
Light 7:	Command-Option-O-F
Light 8: (Xserve G5 only)	Command-Option-D

Published Date: Oct 10, 2016

WebObjects 5.2: UTF-8 Exception in WebObjects Web Services

WebObjects 5.2 applications using Web Services frameworks, such as JavaWebServicesSupport.framework, generate WOResponses in the default system encoding of ISO8859_1 (ISO Latin 1) even if the responses contain UTF-8 encoded international characters.
This article has been archived and is no longer updated by Apple.

Symptom

When clients of WebObjects 5.2 Web Services applications submit forms with UTF-8 encoded international characters, WebObjects ignores the content encoding specified by the requests. WebObjects instead returns responses in the default ISO Latin 1 encoding. Web Services clients expecting a UTF-8 encoded response see an ISO Latin 1 encoded response, and can stop responding and produce a java.io.UTFDataFormatException when reading the SOAP envelope.

Sample error:

Error: java.io.UTFDataFormatException: Invalid byte 2 of 2-byte UTF-8 sequence.

Solution

Developers can implement a workaround to set the encoding to the appropriate UTF-8.

1. Override dispatchRequest() by adding the following code to your WOApplication subclass (your Application.java file):

```
public WOResponse dispatchRequest(WORequest aRequest) {
aRequest.setContentEncoding("UTF-8");
WOResponse aResponse = super.dispatchRequest(aRequest);
aResponse.setContentEncoding("UTF-8");
return aResponse;
}
```

2. Rebuild and rerun your WebObjects Web Services application.

Xserve (Slot Load): Combo Drive Unable to Burn Verbatim 32x CD-R Media

A Combo drive can be added as an option when ordering an Xserve (Slot Load) computer. The Combo drive on Xserve (Slot Load) may not able to burn Verbatim 32x CD-R media.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to burning Verbatim 32X CD-R media an Error 3 occurs.

Solution

Use another media other than Verbatim 32x CD-R. Other Verbatim media do not have this issue and other brands of 32x media have been verified to burn correctly.

Verbatim 32x CR-R media was only made for a limited time and is not readily available. However, if you have this media, you should avoid using it with the Combo drive in an Xserve (Slot Load) computer.

Mac OS X 10.2: Font Handling and Management Technology Brief

This document contains an overview of the Mac OS X font handling and management, and a link to the Mac OS X font handling and management technology brief PDF file.
This article has been archived and is no longer updated by Apple.

Overview of Mac OS X Font Handling

From professional type controls to unlimited open fonts, from cross-platform portability to international language support-these are just a few reasons Mac OS X is the ultimate creative platform. Among other things, it opens the door to powerful new ways of using and managing fonts.

Mac OS X incorporates a new font architecture free from limitations in other operating systems. As a result, Mac OS X provides the most comprehensive support for font formats of any platform. It delivers powerful tools for font organization and navigation. It offers enhanced character coverage for truly professional typesetting. And it enables smooth cross-platform and cross-media portability.

Mac OS X Font Overview

Technology Overview

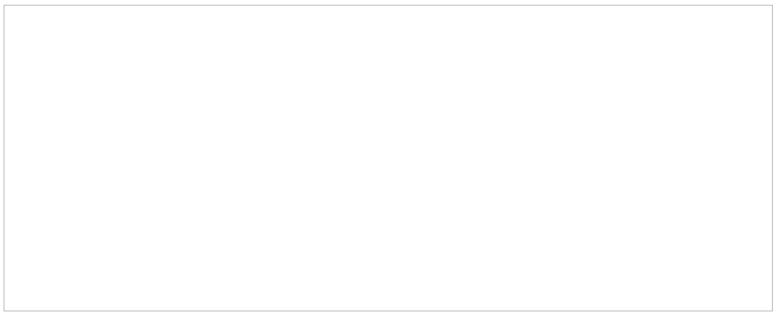
iMac (17-inch 1GHz), iMac (USB 2.0): About the Video Out Port

You can use the video mirroring feature of the iMac (17-inch 1GHz) and iMac (USB 2.0) computers when a display is connected to the video out port.

This article has been archived and is no longer updated by Apple.

The iMac (17-inch 1GHz) and iMac (USB 2.0) computer has a video out port located on the rear of the computer.



1 - Video out	2 - USB	3 - FireWire	4 - Power Plug	5 - Modem
6 - Ethernet	7 - Speaker Mini Jack	8 - Headphone	9 - Audio line in	

Figure 1 iMac (17-inch 1 GHz) or iMac (USB 2.0) rear I/O ports

The video out port allows you to use video mirroring with a compatible VGA display using the Apple VGA Display Adapter (M8639G/A). You can also use video mirroring with a television or projector using S-video or composite connectors when you use the Apple Video Adapter (M9109G/A). Video mirroring allows you to see the same image that is on the iMac's flat-panel display on a second monitor, television or projector. This feature does not allow you to extend the iMac desktop with the external monitor. Both the Apple VGA Display Adapter (M8639G/A) and the Apple Video Adapter (M9109G/A) are available separately, and are required to plug in the monitor, S-video, or composite cable.

The video mirroring feature is "plug and play." Simply connect a VGA display to the Apple VGA Display Adapter, television, or projector to the Apple Video Adapter, then connect the Apple VGA Display Adapter or Apple Video Adapter to the video out port located on the back of the computer. When connecting the adapter to the computer, the screen may refresh momentarily as the iMac reconfigures itself for the new video output.

The computer tries to match the resolution of the built-in and external display. If there is no match, the computer changes both screen resolutions and may black out areas on the built-in display in order to compensate for the capabilities of the external display.

In Mac OS X, you can switch resolutions and frequencies for both the iMac flat-panel display and the external display, television, or projector using Displays pane of System Preferences.

DVD Player in Mac OS X allows video mirroring when playing a movie from a DVD-Video disc. You can view the movie image on the external VGA display, television, or projector connected to the Apple VGA Display Adapter or Apple Video Adapter, as well as on the iMac flat-panel display.

WebObjects 5: "java.lang.OutOfMemoryError" Exception

This document explains how to prevent a WebObjects application from running out of memory.
This article has been archived and is no longer updated by Apple.

Symptom

A WebObjects application may stop responding ("crash" or "hang") with a "java.lang.OutOfMemoryError" exception if the application is particularly large, maintaining a large number of active sessions, or caching too many database objects.

Solution

Assuming the memory usage of the application cannot be reduced (by limiting the number of active sessions, limiting database fetches, and so forth), the exception can be prevented by allowing the Java VM to use more RAM. Unlike other application processes, Java applications are launched with an option specifying the maximum allowed RAM usage. The default maximum is 64 MB.

Use the Java command-line option `-Xmx` to change the maximum RAM usage. There are three places where this can be set:

Method 1: Use Project Builder.

This method only affects applications launched from within Project Builder.

1. Under the Targets tab, select the application executable.
2. Under Launch Arguments, click the "+" icon to add an argument.
3. Enter: `-Xmx128m`

Method 2: Use Project Builder.

This method affects applications launched from within Project Builder, applications launched from the command-line, and applications launched from Monitor.

1. Under the Targets tab, select the main (first) target.
2. Under Settings, select Expert View.
3. Set **JVM_OPTIONS** to `-Xmx128m`
4. Save and rebuild the project.

Method 3: Use the Monitor (JavaMonitor) application.

This method only affects applications launched from Monitor.

1. Click the Applications tab.
2. Click the Config icon next to the application.
3. Under Additional Arguments, enter `-Xmx128m`
4. Click **Push All**.

About -Xmx128m

The option `-Xmx128m` sets the maximum RAM usage to 128 MB, but is only an example. Experiment with different values to find what gives the best performance. Setting the value too high may cause temporary slowdowns during garbage collection or disk paging. Some applications may benefit from setting the minimum RAM usage equal to the maximum. You can do this by setting the Java VM options to `-Xms128m -Xmx128m`.

These techniques may be used to set certain other Java VM options as well. Any option beginning with `-X` or `-D` may be specified. For more information on available arguments, see the Java runtime documentation (http://java.sun.com/j2se/1.3/docs/tooldocs/solaris/java.html#options).

Xserve (Slot Load): Frequently Asked Questions (FAQ)

This document contains frequently asked questions (FAQ) about Xserve (Slot Load), with answers to those questions.
This article has been archived and is no longer updated by Apple.

Questions answered in this document:

1. What is Xserve (Slot Load)?
2. What is the maximum hard drive capacity of Xserve (Slot Load)?
3. What Apple Drive Modules (ADM) are offered with Xserve (Slot Load)?
4. Are Xserve (Slot Load) Apple Drive Modules compatible with Xserve and Xserve RAID?
5. Can the Xserve (Slot Load) serve as a host to Xserve RAID?
6. What is the maximum memory capacity?
7. What ports are available?
8. How many PCI slots are available?
9. What is the serial port intended for?
10. What is the power consumption and BTU information for Xserve (Slot Load)?
11. What is the RAID inbox CD for?
12. What graphics cards are available from Apple for Xserve (Slot Load)?
13. Which mounting racks can the Xserve (Slot Load) be installed in?
14. Does the Xserve (Slot Load) have redundant power supplies?

Question 1: What is Xserve (Slot Load)?

Answer: Xserve (Slot Load) is a rack-optimized 1U server with 4 hard drive bays.

Question 2: What is the maximum hard drive capacity of Xserve (Slot Load)?

Answer: With four Apple Drive Modules of 180 GB each (ATA/100), the total capacity is up to 720 GB.

Question 3: What Apple Drive Modules (ADM) are offered with Xserve (Slot Load)?

Answer: Standard configurations ship with 60 GB 7200 rpm ATA/133 ADM and offer 2 MB of cache. CTO options include the 60 GB ADM and a 180 GB 7200 rpm ATA/100 ADM with 8 MB of cache.

Question 4: Are Xserve (Slot Load) Apple Drive Modules compatible with Xserve and Xserve RAID?

Answer: The 180 GB ADM is compatible with Xserve and Xserve RAID.

Question 5 : Can the Xserve (Slot Load) serve as a host to Xserve RAID?

Answer: Yes, with the Apple Fibre Channel PCI card installed in the upper PCI slot of the dual PCI riser card.

Question 6: What is the maximum memory capacity?

Answer: The Xserve (Slot Load) supports up to 2 GB of memory in four DIMM slots, using PC2700 DDR SDRAM (333 MHz).

Question 7: What ports are available?

Answer: On the back panel are two (2) FireWire 800, two (2) USB, and one (1) DB-9 (RS-232) ports. A single FireWire 400 port is available on the front panel.

Question 8: How many PCI slots are available?

Answer: There are two full-length 64-bit, 66 MHz PCI slots and one (1) half-length 32-bit, 66 MHz combination PCI/AGP slot. So, if no AGP video card is installed a total of three PCI slots are available.

Question 9: What is the serial port intended for?

Answer: The DB-9 (9-pin) serial port allows administrators access the system through a serial console session using UNIX commands.

Question 10: What is the power consumption and BTU information for Xserve (Slot Load)?

Answer: The power consumption and BTU information is available in technical document 86251 "**Xserve (Slot Load): Power Consumption and Thermal Output (BTU) Information** ".

Question 11: What is the RAID inbox CD for?

Answer: If the Xserve (Slot Load) is acting as a host to Xserve RAID, the CD contains applications that need to be installed in order to configure, manage, and monitor the Xserve RAID.

Question 12: What video graphics cards are available from Apple for Xserve (Slot Load)?

Answer: Xserve (Slot Load) includes an ATI graphics card with VGA support, which is installed in the lower dual PCI slot. As a CTO option, Apple offers the ATI Radeon 8500 graphics card (bundled with AGP riser card), which has to be installed in the PCI/AGP combo slot.

Question 13: Which mounting racks can the Xserve (Slot Load) be installed in?

Answer: The server fits EIA-310-D-compliant, industry-standard 19-inch (483 mm) wide racks, including four-post racks (24 inches (607 mm), 26 inches (660 mm), and from 29 to 36 inches (734 mm to 914 mm) deep) and two-post Telco racks (center-mount brackets included).

Question 14: Does the Xserve (Slot Load) have redundant power supplies?

Answer: No.

Xserve and Xserve (Slot Load): Startup Delay With SCSI or Fibre Channel PCI Card Installed

When a SCSI or Fibre Channel PCI card is installed in an Xserve or Xserve (Slot Load) and no boot path has been selected, a startup delay of up to 7 minutes may occur.
This article has been archived and is no longer updated by Apple.

Symptom

When a SCSI or Fibre Channel PCI card is installed, and no boot path has been selected, the server does not start up for up to 7 minutes, or longer. If a display is connected, a flashing question mark appears on screen during this delay.

Solution

Important: This symptom does not indicate a hardware issue.

There are two solutions to this issue.

Change the Startup Volume

1. Wait for the Xserve to startup.
2. Select a valid startup volume in the Startup Disk pane of System Preferences.
3. Use the `setstartupdisk` command as discussed in the Setting Up Mac OS X Server for Xserve manual.

Remove the SCSI or Fibre channel card

If the issue still persists, remove the SCSI and/or Fibre channel cards and test.

If the issue persists after removing the SCSI or Fibre channel card, there may be another issue. Additional troubleshooting documents that may help you are listed below.

Additional information

When the Startup Disk Preference Pane is used to select a valid startup volume, this information is written to firmware as a boot path. If a boot path on the server is missing and one of the cards mentioned above is installed, the BPS (Boot Path Search) will search through all possible SCSI IDs and LUNs looking for a startup device.

Apple Cinema Display (20-inch): Using with Mac OS 9

The Apple Cinema Display 20-inch feature set is fully supported in Mac OS X. If you wish to use the Apple Cinema Display (20-inch) with Mac OS 9, you can, but some features may not be available.
This article has been archived and is no longer updated by Apple.
The Apple Cinema Display (20-inch) system requirements state that it must be used with Mac OS X10.2 or later. When you use this display with Mac OS X and the Classic environment in Mac OS X, the full range of the display's features are available.

When Mac OS 9 is used as the startup system, the display can be used, but some features, including changing the brightness settings or using the launch button to open the Monitors control panel, are not available.

To change the display's brightness, or to make other settings, open the Monitors control panel.

If you have installed an Nvidia graphic adapter you must also install the Mac OS 9 Nvidia software.

Software	Software Update Link
Nvidia Driver Update 3.0 v1.1	120110
Nvidia Graphics Firmware Updater	120168

System requirements

A full description and system requirements for the Apple Cinema Display (20-inch) are available on the Apple displays website (http://www.apple.com/displays/).

WebObjects 5.3: Using Java 1.4 With Mac OS X After J2SE 5.0 Update 4 Is Installed

This article has been archived and is no longer updated by Apple.

After you install J2SE 5.0 on Mac OS X, it becomes the default virtual machine (VM) for all applications, including WebObjects applications. This document explains how to use the version 1.4.2 VM.

There are two ways to specify that a WebObjects application should use the earlier 1.4.2 VM.

To Develop with JVM 1.4.2

Use this method on a project under development. This changes the Java compiler, debugger, and VM used by Xcode.

1. Double click the default (main) target from Xcode Targets. This target will probably have the same name as your project.
2. In the Target view, select the 'Pure Java Specific' entry under the 'Info.plist Entries' --> 'Simple View'
3. In the detail view, with the 'Target VM Version' pop-up menu, select the setting '1.4*'
4. Rebuild the project.

To Deploy applications with JVM 1.4.2

Use this method on an application that is already deployed . This changes the Java VM used at runtime.

1. Stop all instances of the application if they are running.
2. Find your application's .woa file in the Finder.
3. Control-click the .woa file to display the shortcut menu, and choose Show Package Contents .
4. Open the file MacOSClassPath.txt in a text editor. (It's located at: `Contents/MacOS/MacOSClassPath.txt`)
5. Replace the single word java on the first line with the full path to the 1.4.2 Java VM.

   ```
   # JVM == /System/Library/Frameworks/JavaVM.framework/Versions/1.4.2/Commands/java
   ```

6. Re-launch the application.

Xcode generates (overwrites) the MacOSClassPath.txt file during compilation, so this process must be repeated if the application is rebuilt.

Important: WebObjects 5.3.1 and earlier has not been qualified with J2SE 5.0 Update 4. Apple does not support using this combination.

Important: WebObjects 5.3 is available only via Apple Downloads.

Published Date: Oct 10, 2016

Mac OS X 10.2: Volume or Flash Card Does Not Appear in the Finder

In some cases, MS-DOS or Microsoft Windows-formatted volumes, including some Compact Flash Media, do not appear in the Finder.
This article has been archived and is no longer updated by Apple.

Symptom

- MS-DOS or Microsoft Windows-formatted volumes (smaller than 128 GB) do not appear in the Finder.
- Compact Flash cards in a digital camera or card reader connected to the computer are available to iPhoto and Image capture, but do not appear in the Finder.

Solution

If the volume or flash card is 128 GB or larger, stop here and see technical document 107483 **"Mac OS X 10.2: MS-DOS Disk Does Not Appear in Finder"** instead.

An invisible file in the /Volumes directory is preventing the volume or card from appearing in the Finder. Delete this file to make the card appear.

Warning: This document describes how to delete an invisible file by entering commands in the Terminal application. If you are unfamiliar with Terminal and UNIX-like environments, you should proceed with caution. Entering commands incorrectly may result in data loss or unusable system software.

1. Insert the Compact Flash card in the camera or card reader, or try to get the Windows-formatted volume to appear in the Finder.

2. Open Terminal (/Applications/Utilities).

3. Type: `ls -a /Volumes`

4. Press Return. The contents of the /Volumes directory appear. This should work even though the volume or media does not appear in the Finder.

Example: The directory should looks something like this:

. .. .DS_Store ._Unlabeled Unlabeled

In this example, the file named "._Unlabeled" is the invisible file preventing the volume or Compact Flash card named Unlabeled from appearing in the Finder. The files in your /Volumes directory may be named something else, but look for two nearly identical volume names with one having the addition
of ._ at the beginning of the file name.

5. Type: `sudo rm <filename>`

Be sure to replace `<filename>` with the name of the volume or Compact Flash card that begins with "._".

Example: Using the files from the example in step 3, type the following in Terminal: `sudo rm /Volumes/._Unlabeled`

6. Press Return.

7. Type an administrator account password when prompted.

8. Type: `diskutil unmount <diskname>`

9. Be sure to replace `<diskname>` with the name of the volume or Compact Flash card. This ejects the volume or Compact Flash card from the file system.

10. If you are using a flash card, remove the Compact Flash card from the reader or disconnect the camera from the computer.

11. Reinsert the Compact Flash card or reconnect the camera, or try to use the volume in the Finder.

Disk First Aid: Purpose

This article describes the Disk First Aid utility program and what it can do.
This article has been archived and is no longer updated by Apple.
Disk First Aid is a utility program that verifies the directory structure of any Mac OS Standard (HFS) or Mac OS Extended (HFS Plus) format disk.

If imperfections are found within a disk (or "volume"), Disk First Aid can be used as a first step to correct them. If Disk First Aid cannot be used to correct imperfections, other utility programs or repair methods may be used. The following table lists conditions that can be repaired using Disk First Aid:

- Disk volume
- Extent B-tree
- Extent File
- Catalog B-tree
- Catalog File
- Catalog Hierarchy
- Volume Info
- Search for locked volume name

You can save the results of a verification or repair scan as a SimpleText document.

Disk First Aid cannot scan for deleted files or folders on a volume. There are third-party products that perform these tasks, however.

For related information on Disk First Aid and Mac OS disks, please see the following articles:

Article 13628: "**Disk First Aid: What to do When It Finds an Error**"
Article 19516: "**Mac OS: Technical Overview of Disk Volume Structures**"

LaserWriter: Connecting to a Macintosh via Serial Cable

If a user has a single Macintosh and a LaserWriter, is it necessary to connect the two using LocalTalk connectors, or would a serial connection like the Peripheral 8 cable work? Would there be any drawbacks to this?
This article has been archived and is no longer updated by Apple.
It is possible to connect a Macintosh to a LaserWriter and print using a serial cable in many instances, but Apple recommends the use of properly terminated LocalTalk cabling to ensure a working connection. The RS-422 (serial) port on LaserWriters manufactured after the LaserWriter Plus is normally used for LocalTalk and can be identified by its mini-circular 8 port.

Here is a partial list of LaserWriter printers Apple supports using a Peripheral 8 serial cable.

LaserWriter Pro 600
LaserWriter Pro 630
LaserWriter Pro 810
LaserWriter Select 300
LaserWriter Select 310 (This print only supports a Macintosh serial cable)
LaserWriter Select 360
Personal LaserWriter LS
Personal LaserWriter 300
LaserWriter 4/600 PS
LaserWriter 16/600 PS

Consult your LaserWriter User's Guide, it contains connection instructions. If your LaserWriter printer supports serial printing, instructions are provided.

The one drawback to a serial connection on LaserWriter printers designed for LocalTalk is that you lose access to other network services since the LocalTalk port is being used by the serial cable.

Note: Reference the User's Guide for correct printer port settings. You may have to change the pushwheel number or the dip switches.

The finished goods part number for the Peripheral 8 serial cable is M0197, the service part number is 590-0522.
Published Date: Feb 20, 2012

Surge Protectors: Purpose and Selection

Do you have any tips on protecting Macintosh analog boards against electrical surges?
This article has been archived and is no longer updated by Apple.
The usual techniques for protecting any computer product apply. Surges are the biggest cause of product failure.

Background

Electrical power surges can and do occur in all environments. In some areas, they occur regularly. In some cities, the power is very stable, while in others, the power can cut off two or three times a day, if only for a second. Even within cities or neighborhoods, there are variations.

Other factors that contribute to power fluctuations and surges include:

- Quality of the building's wiring
- Number of electrical devices
- Overloaded circuits
- Circuitry and wiring design

All of the above have a bearing on how often a particular system is prone to sustaining damage from electrical surges or spikes, brownouts, or blackouts.

At times, you may encounter situations where power surges produced damage to a system connected to a surge protector. Unfortunately, not all surge protectors give the same amount of protection.

Systems protected with surge protection devices still may sustain varying degrees of damage (from a slow leak on a chip that caused intermittent failures for months, to an outright failure, to melted chips). For example, a lightning strike 2,000 miles away from your system may be able to electronically zap a system through the phone lines. In one known case, the surge carried through the modem, into the computer, damaging the logic board, disk-drive controller board, modem, and two peripheral cards.

Which surge protection device should you buy? How much protection does a device really provide? Can it protect your system in view of your particular environmental condition?

Surge Protector Selection Tips

A single-line surge protector usually protects between hot and neutral wires. This provides minimal protection, which may be adequate for areas and environments that are very stable.

A three-line surge protector protects between:

- Hot and neutral wires
- Hot and ground wires
- Neutral and ground wires

It also has a separate fuse for each line. This offers better protection than the previously mentioned devices.

Don't forget about surge protection to your phone line, if you have a modem connected!

Surges attack over four electrical pathways: hot, neutral, ground, and via phone lines. Protecting only one can leave you vulnerable to damage. On a single-fuse system, if a surge takes out the fuse, all three sources of protection are nullified. In a three-line surge protector with three fuses, if a spike or surge takes out the first fuse, or catches only the "leading edge" of a surge, the second circuit takes over to block or reroute the surge with the third circuit absorbing the remainder.

The effectiveness of three-line protectors also depends on the construction of the device. This includes the speed with which it works and the voltages it can handle, block, or absorb. Price alone is not a reliable indicator, and not everyone needs the same type of device.

There are far more sophisticated systems for surge protection than those mentioned here. These include systems providing emergency power backup, which can cost many hundreds and thousands of dollars. The type of protection your equipment requires must be examined on a case-by-case basis.

Getting Selection Help

To determine your needs, see a qualified expert. Your electric company can conduct measurements to determine electrical activity. Have a consulting electrical engineer or electrician check your electrical environment to determine power loads and the necessary level of protection. Then,

the consultant can advise you of appropriate surge-protection requirements.

Macintosh: How to Print the Screen

How do you print a screen on a Macintosh computer?
This article has been archived and is no longer updated by Apple.

1. Take a screen snapshot by pressing the Command, Shift, and 3 keys on the keyboard. This creates a picture of the screen called "Picture 1" that is stored on your hard disk.
2. Open the file called "Picture 1".
3. Choose Print from the File menu.

Published Date: Feb 20, 2012

Mac OS 9: Installing, Deleting, And Repairing Custom Icons

This article describes how to create folders that use custom icons and how to repair folders when a folder's icon becomes doesn't work or is deleted, or when a folder loses its link to an ICON file. It also describes how to delete custom icons from files and folders.
This article has been archived and is no longer updated by Apple.
The Mac OS let you modify the existing icons any non-system file, folder, or volume. These are called custom icons. They are saved into a file's resource fork, and an attribute bit is set to alert the Finder to display a custom icon. Folders and volumes do not have resource forks, however, so custom icons are saved instead to an invisible file named ICON. This file is located at the root level of the folder or volume.

Creating a Folder That Uses a Custom Icon

Follow these steps to create a folder that uses a custom icon:

1. Select the graphic to use for an icon. An icon in the Get Info window of any document is one possible source. You can also use a graphic application to create your own.
2. Copy the graphic to the Clipboard by choosing Copy from the Edit menu.
3. In the Finder, select the icon you want to change.
4. Choose Get Info from the File menu.
5. Ensure that the Locked box in the lower-left corner of the Get Info window is not checked. You cannot customize the icon of a locked file.
6. Click the icon at the upper-left of the Get Info window or press the Tab key to select it.
7. Choose Paste from the Edit menu.
8. Click the Close box to close the Get Info window.

If the selected graphic is bigger than the icon in the Get Info window, it automatically shrinks to fit.

Deleting Custom Icons

To delete a custom icon, do the following:

1. In the Finder, select the file.
2. Choose Get Info from the File menu. An information window will appear.
3. Click the icon in the top left portion of the window.
4. A rectangle/outline will appear around the custom icon.
5. Press the Delete key to delete the custom icon.

Custom Icon Repair

Sometimes custom icons created for files, folders, or hard disks no longer work or are deleted. If the link between the folder or volume and the ICON file is lost, the Finder may display a generic document icon in place of the custom icon. When attempting to edit this icon through Get Info, you get an error message saying that the item cannot be found. If you have a missing custom icon on a folder, follow these steps:

1. Create a new folder.
2. Copy the folder's contents into the new folder.
3. Drag the empty folder to the Trash.
4. Give the new folder a custom icon by following the steps in the preceding section.

Display Monitors and Geometric Distortion

This article explains why computer monitors experience geometric distortion, and describes possible solutions.
This article has been archived and is no longer updated by Apple.

Overview

The earth's magnetic field often distorts a monitor's visible raster, which is the lighted portion of the display. A monitor properly adjusted at the factory may appear significantly different when it is set up in its new environment. The raster may be tilted, off-center, or various forms of distortion such as soft corners or raster edges that may not be perfectly straight.

The influence of the earth's magnetic field is not peculiar to Apple monitors. All monitors are affected to some degree. The distortion depends on the location of the monitor. This can be demonstrated by moving the monitor to another location or by rotating it 90 degrees. The movement may either improve or worsen the shape and position of the raster. Usually, the effects of the earth's magnetic field are primarily cosmetic. The active area of the screen, where work is actually performed, is still very usable.

Below are some tips to help you determine whether a monitor exhibiting geometric distortion needs to be repaired or is simply being influenced by some environmental interference.

Change Location

If your monitor has a distorted raster, move the monitor to another location and note any changes in the display. If the display changes when the monitor is moved or rotated, the monitor's environment is the source of the distortion. Servicing the monitor will make no difference.

Remove Metal Objects From the Area

Operating a monitor near large metal objects such as desks, file cabinets, or bookshelves may worsen the situation. If possible, rearrange the work area so that large metal objects are as far from the monitor as possible.

Look for Other Environmental Influence

If the raster jitters, or has bars or lines in the display, this may indicate another type of environmental interference. If the monitor is close to another monitor, electrical appliance, or other electronic gear, turn off the power to the other unit(s) to see whether the monitor returns to normal operation.

Fluorescent lighting fixtures are also common sources of external interference. The lights can arc internally (although the lights don't flicker) and cause interference with the monitor. In these cases, turn off the lights momentarily to see whether the display distortion stops.

How To Verify Environmental Interference as the Cause of Distortion

The best way to verify environmental interference as the cause of the distortion is to remove the unit from the building and check for the same symptoms at another location. If it is intermittent, look for electric devices that operate intermittently. These include, but are not limited to, coffeemakers, copy machines, refrigerators and other household appliances.

Caution

You can compensate for some of the geometric distortions mentioned by performing various monitor adjustments. However, Apple does not recommend these corrections. Remember that the monitor left the factory within specification. Although a particular environment can distort a properly adjusted monitor, by adjusting the monitor to suit a particular environment, you are actually changing the monitor's correct factory settings.

If the monitor is moved, or the environment in which it operates is changed (including everything from rearranging furniture to the construction of a nearby building), the resulting geometric distortion could be worse because the monitor is no longer set to its factory specifications.

Things that can keep your PowerBook or iBook from going to sleep

The following activities may prevent a PowerBook or iBook computer from sleeping unless a low-power condition occurs:
This article has been archived and is no longer updated by Apple.

- The PowerBook or Energy Saver control panel Sleep slider selections are set to "Never."
- The serial driver is open and active.
- File sharing is turned on.
- AppleTalk is active (even if the computer is not logged on to a file server, and even if the computer is not connected to an AppleTalk network). Check the AppleTalk control panel or the Chooser to determine whether AppleTalk is active on your computer.
- An internal modem's auto-answer function is on.
- Some third-party applications keep the computer busy, not allowing idle processor time for sleep to occur.
- If you have any System 7.5 Apple Guide help file windows open.
- The CSW 4000 Series Background extension. Use the Extensions Manager control panel to turn off the CSW 4000 Series Background extension. This disables background printing but allows the PowerBook or iBook to sleep normally.
- Version 1.0.3 or earlier of the PowerBook control panel. In this case, the computer does not sleep automatically after the "System Sleeps" time interval has elapsed. (You can still put the computer to sleep by selecting Sleep from the Special menu or closing the computer's cover.)

Additional Troubleshooting Tips for PowerBook 5300 and PowerBook 190

There is a known issue with the password security feature on the PowerBook 5300 and 190 series computers. If you open the Password Security control panel and password security is turned on and it is set to "ask for password on wake", the PowerBook does not sleep. One workaround is to turn off the "ask for password on wake" feature. If this is done, the PowerBook can be put to sleep. This issue can be resolved by installing the System 7.5 Update 2.0 (or later system software), which includes the Password Security 1.0.3 control panel.

Check to make sure that there are no extensions or control panels in the System Folder that may be causing the computer to assume that the system is busy. (For example, the FocalPoint II INIT has been shown to cause this; others may also.)

Make sure there are no applications currently running that would keep the system busy. (For example, Microsoft Word's automatic repagination option keeps the system awake.)

An extension called Insomnia came on the Install Me First disk with some versions of the system software. If this extension is mistakenly put into the Extensions folder in the active System folder on the hard disk, the PowerBook does not go to sleep. It should be removed from the hard disk. Insomnia is an extension that keeps the PowerBook from going to sleep during the installation process when starting from the Install Me First disk.

Mac OS: Why the Clean Up Command Leaves Gaps Between Icons

Why is it that when I use the Finder's "Clean Up by Name" command, with the Option key held down, the result is often large gaps between the icons in the window?

This article has been archived and is no longer updated by Apple.

This is a feature of the Finder that was first introduced with System 7. It prevents the overlapping of long filenames so you can read each icon's complete name, regardless of its length.

The Mac OS allows a long filename on an icon to run into the next spot on the grid rather than placing another icon there. The Finder skips one spot on the grid and places the next icon in the next available spot. This creates extra space between icons. The Finder does this regardless of the "Always snap to grid" choice in the Views control panel. If you don't like the extra space, you can manually place the icons where you want them. Alternatively, try shortening the name of the file or folder that is causing the gap.

Mac OS: Troubleshooting a File that Won‘t Go Away

This article discusses steps to erase a file that cannot be emptied from the Trash.
This article has been archived and is no longer updated by Apple.

Symptom

A message says that a file cannot be emptied from the Trash. If a file cannot be emptied from the Trash it may be that the file is locked, or a sign of serious directory damage.

Solution

Try these steps to empty the Trash:

- Hold down the Option key while emptying the Trash.
- Start up the computer with extensions off and empty the Trash.
- Start up the computer from the Mac OS disc and empty the Trash.
- Verify and repair the disk with Disk First Aid or other appropriate repair utility.

If the file is locked, hold down the Option key while choosing Empty Trash from the Special menu. If it is a hard disk error, it is important to repair the issue since it may become worse and other files may be damaged or lost.

To repair the hard disk's directory structure, start up the computer from the Mac OS disc and verify or repair the hard disk with Disk First Aid. If Disk First Aid finds an error but is unable to repair it, consider backing up the hard disk and reinitializing it with Drive Setup or other appropriate utility.

There is one more technique you can try, but depending on the cause of the issue, it may not work. If the following steps don't help, or if the issue reappears, you should initialize the hard disk to completely correct the issue.

The following file and folder names are not important, just the concept.

1. Create a folder on the desktop called Test.
2. Drag the file in question from the Trash to the Test folder.
3. Open the application program used to create the file. (If you do not have the original application, use SimpleText.)
4. Create a new file, and save it to the desktop with the same name as the problematic file.
5. Drag the file you just saved from the desktop to the Test folder. You are prompted to replace the file. Replace it. This should eliminate the file.

If this technique does not work, and emptying the Trash still does not erase the file, back up hard disk and reinitialize it using Drive Setup or other appropriate disk formatting utility.

Mac OS: Installing Fonts and Sounds

This article offers several methods for adding fonts and sounds to Mac OS.

This article has been archived and is no longer updated by Apple.
The methods described below are applicable to all versions of System 7, Mac OS 8, and Mac OS 9.

There are three ways to install fonts and alert sounds. The first of these is the easiest and is the preferred method. With all three methods, it is best to first quit all applications before making any changes/additions to the system's fonts or alert sounds.

Method One (preferred)

1. Drag the font or sound onto the closed System Folder icon.
2. A dialog box appears asking you to confirm the action. Click OK. The files are moved to the correct location(s).

Method Two

- Drag fonts onto the closed Fonts folder. The Fonts folder is inside the System Folder.
- Drag sounds onto the closed System file. (See Note 1.)

Method Three (sounds only)

- Drag the sound into the window of the opened System file. (The System file can be opened as if it were a folder.)

Notes:

1. If you don't get a confirming alert message after dragging a sound onto the System file icon, the sound is probably the wrong resource type and was put into the System Folder instead of the System file. Open the System Folder and see if the sound was left sitting inside the System Folder instead of being installed in the System file. If that happens, Method One may work.

Mac OS 9: System Startup Stops ("Freezes") at Happy Mac

Disk First Aid 8.6 or later resolves a situation in which a Mac OS 9 computer stops responding ("freezes") at the Happy Mac icon during the system startup process.
This article has been archived and is no longer updated by Apple.

Symptom

The computer stops responding ("freezes") at the Happy Mac icon during the system startup process.

This occurs most often in configurations that involve AppleShare IP Servers acting as Macintosh Manager Servers. However, it can happen to any computer with a hard disk that was initialized using the version of Drive Setup included with Mac OS 9.0 through 9.0.4, or by choosing the Erase Disk command from the Special menu. Normally the issue occurs on computers with a very large number of files (greater than 100 000); and it may occur after large numbers of files were moved, copied, or deleted.

Solution

Repair the affected volume with Disk First Aid version 8.6 or later. If you reinitialize the hard disk using the Erase Disk option in the Special menu, be sure to use Disk First Aid afterwards to repair the volume.

You may download Disk First Aid 8.6.1 from software download document 75102: "**Disk First Aid 8.6.1: Software and Information**"

Mac OS: How to Set up Extended Desktop and Turn on Video Mirroring

This document explains how to set up an extended desktop and turn on video mirroring.
This article has been archived and is no longer updated by Apple.

Extended desktop

When more than one monitor is connected to your computer, the desktop area can be extended to create a larger work area. To use this feature, your computer must generally have two or more video cards installed. (Some Apple computers can work with two monitors without requiring an additional video card. Check the documentation that came with your computer.)

The Mac OS automatically recognizes when two or more monitors are connected to the computer. You can choose which monitor has the menu bar, and you can arrange the logical desktop space to match the physical placement of the monitors (which one is on the left or right, for example).

To make these settings:

1. Open the Monitors control panel (Mac OS 9) or the Displays pane of System Preferences (Mac OS X).
2. Click Arrange.
3. Follow the on-screen instructions.

Figure 1 Mac OS 9 Monitors control panel

Figure 2 Mac OS X Displays pane of System Preferences

Video mirroring

The video mirroring feature allows you to see the same screen on two different monitors. This is particularly useful in a classroom or presentation setting where you need to be in front of an audience that is watching one screen, and you are watching the other.

To use this feature, your computer must generally have two or more video cards installed. (Some Apple computers can work with two monitors without requiring an additional video card. Check the documentation that came with your computer.)

In Mac OS 9, choose Turn Video Mirroring On from the Video Mirroring portion of the Control Strip.

Figure 3 Video Mirroring portion of the Control Strip

Follow these steps to turn on video mirroring in Mac OS X:

1. Open System Preferences.
2. Click Displays.
3. Click the Arrange tab (if necessary).
4. Click Mirror Displays to enable this option.

Macintosh Computers and LaserWriters: Noise Levels

This article provides information about noise levels from Macintosh computers and Apple LaserWriter printers.
This article has been archived and is no longer updated by Apple.
Acoustic noise is usually perceived as being how 'loud' a machine appears to a listener. To compare the 'loudness' of products, the International Standards Authority (ISO) has produced a number of specifications (including ISO 7779 and ISO 9295) that define acoustic noise terminology and how it can be measured, and a specification (ISO 9296) defining how the measured values should be declared in a consistent way. ISO has not, however, laid down any acoustic noise limits that IT Equipment (ITE) should meet; this has been left to government and commercial authorities to set.

The specifications describe two measures of acoustic noise, Sound Power and Sound Pressure. Sound Power is effectively the total 'loudness' of a device while Sound Pressure is the measure of noise at a point in space. For Sound Power and all Sound Pressure positions, there are two measurement modes; idle, where the ITE is turned on and operational but not doing useful work; and operational, where the ITE is doing useful work (e.g. disk access). Sound Power is not affected by a change in environment whereas Sound Pressure is affected, since extraneous acoustic noise will affect the measurement.

Acoustic noise is measured by sound pressure meters (it measures all sound coming from the ITE and all other influences, whether audible or not), and is statistically adjusted, called 'A-weighting', to relate it to the audible hearing range. These values are expressed as decibels (dBA).

Noise Levels, Macintosh Computers				
	Sound Power		Sound Pressure at 25 cm	
Model	**Operational**	**Idle**	**Operational**	**Idle**
iBook	42 dBA	34 dBA	37 dBA	29 dBA
iMac	44 dBA	43 dBA	32 dBA	31 dBA
iMac (Slot loading)	39 dBA	35 dBA	31 dBA	27 dBA
PowerBook G3 Series (Bronze keyboard)	49 dBA	36 dBA	41 dBA	23 dBA
Power Macintosh G3 desktop enclosure	44 dBA	42 dBA	36 dBA	34 dBA
Power Macintosh G3 (Blue and White)	45 dBA	42 dBA	30 dBA	29 dBA
Power Mac G4	51 dBA	48 dBA	44 dBA	39 dBA
Notes * All sound pressure values were measured 25 cm from the front of each computer. * The hard drive noise levels vary within the same model from the same company and may result in slightly different results than that reported above.				

LaserWriters	Standby	Printing
LaserWriter, LaserWriter Plus	< 45 dB	< 50 dB
LaserWriter II	< 50 dB	< 60 dB
Personal LaserWriter	< 40 dB	< 54 dB
Personal LaserWriter 300/320	36 dB	46 dB
LaserWriter Select 300	36 dB	43 dB
LaserWriter Select 360	36 dB	47 dB
LaserWriter Pro 600/630	34 dB	49 dB
LaserWriter 4/600	36 dB	46 dB
LaserWriter 16/600	34 dB	52 dB
LaserWriter Pro 810	40 dB	53 dB
LaserWriter 12/640 PS	31 dB	50 dB
Color LaserWriter 12/600 PS	45 dB	55 dB
LaserWriter 8500	~35 dB	~50.5 dB

PowerBook (FireWire): Issue With Target Disk Mode

I'm trying to connect my PowerBook (FireWire) to another computer through FireWire Target Disk Mode (TDM). However, the PowerBook hard disk never appears on the desktop of the host computer.
This article has been archived and is no longer updated by Apple.
Make sure you are following the directions in the following article:

Article 58583: "**PowerBook (FireWire): FireWire Target Disk Mode.**"

Most importantly, the host computer must have Mac OS 8.6 or later and FireWire 2.3 or later installed.

If you are still unable to get the PowerBook hard disk to appear on the desktop of the host computer, you may be running into an issue with FireWire TDM that requires a software update. To remedy this issue, use the Software Update control panel to download and install Mac OS 9 Update (9.0.4) on the host computer. You can also download the update from Apple Software Updates at http://www.apple.com/swupdates/ .

For more information on the Software Update Control Panel, please see the following article:

Article 60504: "**Mac OS 9: How To Use The Software Update Control Panel**."
Published Date: Feb 20, 2012

AirPort Software Base Station (Mac OS 9): Sharing an Internet Connection over Ethernet

This article explains how to share an Internet connection (modem or Ethernet) from an AirPort Software Base Station to client computers that are not equipped with AirPort.
This article has been archived and is no longer updated by Apple.

Sharing a modem Internet connection

If you use PPP as your connection to the Internet, client computers connected to a Software Base Station using Ethernet can be configured using the DHCP server on the Software Base Station computer.

Settings in the AirPort application on the Software Base Station computer

In the Network pane of the Software Base Station panel, select the checkbox for "Also support Ethernet client computers using NAT." This turns on DHCP services as well as NAT (Network Address Translation) and routing for the Ethernet connection.

Note: Versions of AirPort software earlier than 1.3 say "Also provide IP addresses on Ethernet" in the Network pane.

Settings in the TCP/IP Control Panel on the client computers

Select "Using DHCP Server" from the Configure pop-up menu. This instructs the client computer to obtain an IP address from the DHCP server on the Software Base Station computer.

Sharing an Ethernet Internet connection

If you use Ethernet as your connection to the Internet, client computers connected using Ethernet to a Software Base Station must be manually configured. The DHCP server on the Software Base Station cannot be used to provide an IP address to the client computers.

Settings in the AirPort application on the Software Base Station computer

In the Network pane of the Software Base Station panel, select the checkbox for "Also support Ethernet client computers using NAT." This only enables the routing service and NAT over Ethernet and does not provide DHCP services.

Note: Versions of AirPort software earlier than 1.3 say "Also provide IP addresses on Ethernet" in the Network pane.

Settings in the TCP/IP Control Panel on the client computers

1. Set the computers to use a manually assigned IP address by selecting the option to Configure: Manually.
2. Enter an IP address in the range of `10.0.2.51` to `10.0.2.254` in the IP Address field.
3. Enter `255.255.255.0` in the Subnet mask field.
4. Enter `10.0.2.1` in the Router address field.
5. Enter the IP address of the name server in the Name Server addr. field. This IP address is usually provided to you by your Internet service provider.

Notes:

Software base station is not a feature of Mac OS X. For related information, see technical document 106507: "**Mac OS X 10.1: AirPort Software Base Station Is Not an Included Feature**"

Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access**."

QuickTime Streaming Server: Making PlaylistBroadcaster Open and Start at Server Startup

I have three separate playlists that I would like to have start up automatically when my Mac OS X Server is starting up. How can I do this?
This article has been archived and is no longer updated by Apple.
Below is the text of the startup script that runs at Mac OS X Server startup. As you can see, it is the script that launches QuickTime Streaming Server (QTSS) the first time.

```
File:  /private/etc/startup/1900_QuickTime
========================================
#!/bin/sh

. /etc/rc.common

if [ "${QTSSERVER}" = "-YES-" ]; then
   ConsoleMessage "Starting QuickTime streaming server"

   /usr/sbin/QuickTimeStreamingServer
fi
```

Modify this script in the 'if' portion. Add the absolute path to a shell script that starts up your playlist broadcasters. The line should go after "/usr/bin/QuickTimeStreamingServer".

```
File:  /private/etc/startup/1900_QuickTime
========================================
#!/bin/sh

. /etc/rc.common

if [ "${QTSSERVER}" = "-YES-" ]; then
   ConsoleMessage "Starting QuickTime streaming server"

   /usr/sbin/QuickTimeStreamingServer
   /path/to/shell/script/start_3_playlist_broadcasters
fi
```

Note: Paths to the actual hinted media files in the playlist and broadcast config files should not be relative, but should be absolute because the playlists themselves will be running at startup time, and not necessarily from their own local subdirectories.

iMovie 1.0.2: Read Me

This article comprises the Read Me for iMovie version 1.0.2. This software was released by Apple on 28 April 2000 and is available for downloading from the Apple Web site. Use the following URL to access the download:

http://www.apple.com/imovie/download/

Description
iMovie is an application that integrates digital video (DV) capture, scene editing, titling, transition effects, and audio to create broadcast-quality movies.

Requirements

- A Power Mac G4 or PowerBook FireWire
- Mac OS 9.0.4 or later
- QuickTime 4.1 or later
- 64 megabytes (MB) of random-access memory (RAM)
  iMovie requires a minimum of 16 MB of free memory.
- A CD or DVD drive
- 2 gigabytes (GB) of available hard disk space highly recommended
- A display that supports 800 x 600 resolution and thousands of colors (1024 x 768 and millions of colors recommended)
- A built-in FireWire (IEEE 1394) port
- A 4-pin to 6-pin FireWire cable (for use with DV camcorders)

This article has been archived and is no longer updated by Apple.

About iMovie 1.0.2

Welcome to iMovie, an application that integrates digital video (DV) capture, scene editing, titling, transition effects, and audio to create broadcast-quality movies.

For the latest news and information about iMovie including a list of camcorders and DV devices that work with iMovie, go to the iMovie World Wide Web site at www.apple.com/imovie

The following topics are covered in this document:

- System requirements
- Installing iMovie
- Using iMovie
- Hardware compatibility
- Third-party software
- Solving problems

System Requirements

- A Power Mac G4 or PowerBook FireWire
- Mac OS 9.0.4 or later
- QuickTime 4.1 or later
- 64 megabytes (MB) of random-access memory (RAM)
  iMovie requires a minimum of 16 MB of free memory.
- A CD or DVD drive
- 2 gigabytes (GB) of available hard disk space highly recommended
- A display that supports 800 x 600 resolution and thousands of colors (1024 x 768 and millions of colors recommended)
- A built-in FireWire (IEEE 1394) port
- A 4-pin to 6-pin FireWire cable (for use with DV camcorders)

Installing iMovie

Double-click the iMovie Installer icon and follow the onscreen instructions. The application and components will be placed in a folder named iMovie at the top level of your hard disk.

Using iMovie

- When you open iMovie for the first time, click Create a New Project and follow the onscreen instructions.

For optimal performance

- Quit any other applications. iMovie should be the only application open.
- Do not switch monitor resolutions while rendering is in progress.

File formats supported

You can import the following file formats:

- Still images: PICT, JPEG, GIF, BMP, and Photoshop
- Audio files: AIFF, MP3, CD audio tracks

You can export the following file formats:

- QuickTime movies
- Still images: PICT and JPEG
- Video to DV tape

Note: iMovie does not work with clips that have a 16:9 aspect ratio.

Important: Do not unplug DV devices during import or export processes.

Fonts supported

The titling feature in iMovie supports TrueType, as well as AdobeTM PostScriptTM, fonts.

Capturing live video from a camcorder

If you want to capture live video into iMovie from your DV camcorder, Apple recommends that you have a tape in your camcorder.

To capture live video from a camera, follow these steps:

1. Switch the camera to Camera mode and set the Lock/Standby switch to Standby.
Note: If you have a tape in the camcorder and video is not playing through to iMovie, make sure the tape's write-protection tab is unlocked.

2. Make sure the camera's Demo mode is disabled.
Some cameras switch to a Demo mode when left on Standby without a tape inserted. Check for a Demo function in your camcorder's settings menu and disable it.

Important: Capture video to projects on local hard disks. Do not capture video to projects saved on a server. Video cannot be reliably captured over a network to projects saved on a server.

Renaming clips

You can rename clips within iMovie. However, do not change the names of clips in your project folder. This will break links to the media in your project file.

Maximum movie and clip size

The maximum length of a movie is limited only by the available disk space on your computer. There is no limit to the number of clips that can be combined to create a single movie. However, the maximum file size of an individual movie clip is 2 GB. If you exceed this 2 GB limit during an extended duration capture, iMovie will continue the capture into a second clip.

Doing other work while rendering

You can continue working in a project while rendering transitions or titles. Performance may decrease if you have more than two render processes running simultaneously.

Emptying the Trash resets the Undo command

If you empty the Trash in iMovie, you will not be able to undo any actions taken before emptying the Trash.

About audio

This version of iMovie fixes an audio problem that introduced distortion in loud audio levels coming from the camcorder.

Changing the sound input device

Do not change the sound input device while iMovie is running. iMovie uses an external or built-in microphone as the sound input device to record your voice. To change the sound input device, quit iMovie, then select the desired device in the Sound control panel or the Control Strip.

Hardware Compatibility

Using DV devices

iMovie will not work with more than one DV device connected to your computer via FireWire.

Using additional storage devices

iMovie requires hard disks with fast transfer and access rates. If you're using additional storage devices, make sure you use drives with a sustained transfer rate of 3.6 MB or higher.

The following storage devices do not meet the minimum transfer rate or capacity requirements to work with iMovie:

- SuperDisk drives
- Floppy disk drives
- Zip drives
- AppleShare or IP-mounted file servers

Tips for using certain camcorders

Using Canon camcorders

If you cannot pause the camcorder during rewind or fast-forward in iMovie, press the Stop button instead of the Pause button.

Using Panasonic camcorders

If you try to export to tape and the camcorder LCD flashes the message "Check DV Input," then goes into Record/Pause mode but doesn't start recording, do the following:

1. Stop the camcorder and cancel the export.
2. Add a few extra seconds of black before the recording, or increase the time to wait for the camcorder in the Export Movie window.
3. When you export to tape, watch for black frames being sent to the camcorder on the LCD then press the Still button on the camcorder's VTR controls to begin recording.

Using the Sharp VL-PD3

If you attempt to export to tape and the camcorder goes into Record/Pause mode, but never actually starts recording, do the following:

1. Stop the camcorder and cancel the export.
2. Add a few extra seconds of black before the recording, or increase the time to wait for the camcorder in the Export Movie window.
3. When you export to tape, press the Play button on the camcorder's VTR controls to begin recording.

Third-Party Software

Using QDesign Music Codec 2 Professional Edition sound compression

If you plan to use this sound compression software with iMovie, you must first export a movie through QuickTime Player using this codec and register the software with its serial number. You can then export movies with QDesign Music Codec 2 sound compression through the Expert export settings in iMovie.

Solving Problems

Video standard of the camcorder doesn't match the video standard of a project

Before you create a project, connect the camcorder to your computer and turn the camcorder on. If you are using a PAL-format DV camcorder, iMovie will recognize the device and create the project in PAL format.

Performance is slow or a message says memory is low

- Quit any applications running in the background.
- Increase the amount of memory allocated to iMovie by doing the following:
    1. Quit iMovie.
    2. Locate the iMovie application (not the alias) and click its icon once.
    3. From the File menu, choose Get Info.
    4. Choose Memory from the Show pop-up menu.
    5. Increase the number in the Preferred Size field to 30720, then close the window and restart iMovie.

A message says the device is too slow

If you're using a FireWire storage device and a message says the device is to slow, you may need to update the device driver software. Go to the manufacturer's Web site and download the latest device driver. Install the driver software and restart your computer, then restart iMovie. For more information, contact the device's manufacturer.

No video appears on the monitor when capturing video in Camera mode

If you can control your camcorder within iMovie using Camera mode, but are not receiving any video on the computer's monitor while your camcorder is still on, disconnect the FireWire cable from the computer, then reconnect the cable.

A discrepancy occurs between the playhead reading at the end of a clip and the clip's duration

There is a one-frame difference between the duration of a clip and the playhead reading when the playhead is parked on the last frame. This is normal and will not affect your project.

You can't export a movie to a PAL camcorder

If you cannot record to your PAL camcorder, contact the manufacturer and check the specifications for your device. Certain PAL devices have FireWire (IEEE 1394) input disabled.

Audio dropout happens in movies that are exported to tape

If you experience audio dropout in a movie that you have exported to tape, return to your project and lower the volume level of the affected clip with the volume slider in the Audio Viewer. Then re-export your movie.

You can't delete iMovie resource files

If you experience trouble deleting iMovie resource files, do the following:

1. Select the file you want to delete.
2. Choose Get Info from the File menu.
3. Make sure there is no checkmark in the Locked checkbox.
4. Drag the file to the Trash.
5. Choose Empty Trash from the Special menu.

About AppleShare IP Web & File 6.3.2

This article provides the Read Me for AppleShare IP Web & File 6.3.2.
This article has been archived and is no longer updated by Apple.
AppleShare IP Web & File 6.3.2 has been replaced by a newer software version and is no longer available. This document is provided for those who may still be using the software.

For recent downloads, refer to the Apple Downloads page at
http://www.apple.com/support/downloads/ and search AppleShare IP.

For related information, refer to article 106121: "AppleShare IP 6.3.x: Installing Downloadable Updates"

Description

AppleShare IP Web & File 6.3.2 fixes a potential security problem in the Web server in versions of AppleShare IP 6.1 and later. When an invalid range request is made to the Web server by a client computer, the Web server can return an extra 32 kilobytes (kb) of data.

Requirements

To upgrade to AppleShare IP Web & File 6.3.2, you must have an iMac, Power Macintosh, Macintosh Server, or Workgroup Server with a PowerPC G4, G3, 604e, 604, 603e 6500 series, or 601 microprocessor that has the following installed:

- Mac OS 9.0.4 (If you have a Macintosh Server G4 with Mac OS 9.0.3 installed, you do not need to upgrade to Mac OS 9.0.4.)
- AppleShare IP version 6.3.1

Note: If you have AppleShare IP 6.1, 6.2 or 6.3, first upgrade to Mac OS 9.0.4 and AppleShare IP 6.3.1 before you install AppleShare IP Web & File 6.3.2.

About AppleShare IP Web & File 6.3.2

AppleShare IP Web & File 6.3.2 fixes a potential security problem in the Web server in versions of AppleShare IP 6.1 and later. When an invalid range request is made to the Web server by a client computer, the Web server can return an extra 32 kilobytes (kb) of data.

Requirements for running the update

To upgrade to AppleShare IP Web & File 6.3.2, you must have an iMac, Power Macintosh, Macintosh Server, or Workgroup Server with a PowerPC G4, G3, 604e, 604, 603e 6500 series, or 601 microprocessor that has the following installed:

- Mac OS 9.0.4 (If you have a Macintosh Server G4 with Mac OS 9.0.3 installed, you do not need to upgrade to Mac OS 9.0.4.)
- AppleShare IP version 6.3.1

Note: If you have AppleShare IP 6.1, 6.2 or 6.3, first upgrade to Mac OS 9.0.4 and AppleShare IP 6.3.1 before you install AppleShare IP Web & File 6.3.2.

Installing AppleShare IP Web & File 6.3.2

To install AppleShare IP Web & File 6.3.2:

1. Open the Extensions folder within the System Folder on your server and drag the old version of the "AppleShare IP Web & File" extension to the trash.
2. Drag the "AppleShare IP Web & File" icon from the AppleShare IP Web & File 6.3.2 package into the Extensions folder.
3. Restart your computer.

POP Mail Collection Relies on Header Information

When a mail server collects mail using POP (Post Office Protocol), it relies on the recipient's name being in the mail header. If the mail server cannot find a local recipient in the email header, it will send the mail to the Postmaster. Email sent through mailing lists and or as a blind carbon copy (BCC) are two common situations where the intended recipient is not listed in the email header.
This article has been archived and is no longer updated by Apple.
The list of addresses included in the header fields (To: and CC:) are not used by an SMTP (Simple Mail Transfer Protocol) server to route mail to the final destination. The purpose of these fields is purely for display, and to allow email clients to reply, and perform other functions that have nothing to do with mail routing.

Mail routing is achieved through a set of SMTP commands that a client sends to a server (or that one server sends to another server). These commands are separate from the message headers and body. Blind carbon copy, for example, is implemented by using the SMTP commands to route mail to the destination addresses, but not printing the BCC address anywhere in the message text itself. That way, the user receives the mail, but there is no evidence in any of the emails that this happened. The only evidence that the user received the mail would be located in the SMTP logs on a mail server. Similarly, mailing lists have the list address--not the individual user's address--printed as the destination in the header.

Once mail is delivered to a POP mailbox, the information contained in an SMTP stream is lost. If the header text of the email does not contain the recipient information, the mail server has no way to regain that lost information to determine the true recipient of the message. When this happens, the mail server routes the mail to the local "Postmaster" account.

Some mailing lists work correctly even if the mail appears to be addressed to the list, and not the user. These lists add additional fields in the header indicating the true destination of the email. In addition to addresses listed in "To:" and "CC:", the mail server looks for the following headers to find the destination:

- X-Real-To:
- Envelope-To:
- X-POP3-Rcpt:

To see if you are experiencing this issue, you can inspect your full email header (most email clients have a "View Header" feature). Look for a local user account listed in the "To:" and "CC:" fields or any of the fields mentioned above. If you see no email address for your server listed, or if you see a local address in a field other than those mentioned above, then the mail server is behaving correctly in delivering this mail to the Postmaster.

This limitation of the POP collection method can lead to the symptom described in article 86029: "**AppleShare IP 6.x: Some Mail is Misrouted to Postmaster**"

QuickTime Streaming Server 2.0.1: Read Me

This article comprises the Read Me for QuickTime Streaming Server version 2.0.1. This software was released by Apple on 03 May 2000. It is available for download from the Apple Software Updates Web site at http://www.apple.com/swupdates/.
This article has been archived and is no longer updated by Apple.

Description

QuickTime Streaming Server streams QuickTime-compatible media to client applications that support QuickTime, including a Web browser with the QuickTime plug-in.

Requirements

- Power Macintosh G4, Power Macintosh G3, Macintosh Server G3, and Macintosh Server G4. The iMac, iBook, and PowerBook are not supported as QuickTime Streaming Servers.
- The latest version of Mac OS X Server must be installed. Refer to the Apple Support site: www.apple.com/support for information on obtaining this release.
- At least 64 MB of random-access memory (RAM). If you anticipate heavy traffic on your server, Apple recommends 512 MB of RAM and 350 MHz or higher processor speed, 3 Ultra Wide SCSI drives, and an Ethernet card with DEC chip driver.

What's New With QuickTime Streaming Server 2.0.1

System Requirements

Installing and Setting Up QuickTime Streaming Server Software

Modifying Configuration Files

Technical Specifications

Support

Open Source

Using QuickTime Player

What's New With QuickTime Streaming Server 2.0.1

QuickTime Streaming Server 2.0.1 addresses several product and Open Source issues and provides general product enhancements such as:

- improved audio and video sync for streams broadcasted using the Playlist Broadcaster.
- improved logging of client error messages.
- improved server CPU performance when serving non-optimized hinted QuickTime movies.

It also fixes this problem:

- Unwanted clicks on audio tracks, especially when a file isn't optimized for streaming.

System Requirements

- Power Macintosh G4, Power Macintosh G3, Macintosh Server G3, and Macintosh Server G4. The iMac, iBook, and PowerBook are not supported as QuickTime Streaming Servers.
- The latest version of Mac OS X Server must be installed. Refer to the Apple Support site: www.apple.com/support for information on obtaining this release.
- At least 64 MB of random-access memory (RAM). If you anticipate heavy traffic on your server, Apple recommends 512 MB of RAM and 350 MHz or higher processor speed, 3 Ultra Wide SCSI drives, and an Ethernet card with DEC chip driver.

Installing and Setting Up QuickTime Streaming Server Software

To install and set up QuickTime Streaming Server software, follow these steps:

1. When updating from a previous version of QuickTime Streaming Server you must stop streaming service and quit QuickTime Streaming Server Admin.

2. From the WorkSpace Manager, double-click the QTSS_2.0.1.tar file. Don't try to use the tar command in Terminal.app to extract the

file. It will not install the files properly.

3. Click the Unarchive button.

4. Double-click the QTSSInstaller.assistant icon.

5. Follow the onscreen instructions. Once you've answered the license agreement, you will need to switch to the Installer application which has launched and opened as a background window. Bring the window to the foreground before you continue.

6. Follow the onscreen instructions to complete the installation.

7. Choose Server Administration from the Apple menu, then choose QuickTimeStreamingAdmin.

8. Choose Settings from the Server menu to start configuring your server.

For help on using QuickTimeStreamingAdmin and setting up your server to stream hinted media, choose QuickTime Streaming Help from the Help menu. You can also access streaming help by choosing "Streaming media" from the Server Administration Help table of contents.

Modifying Configuration Files

If you enter a string that includes spaces in a configuration file, you must put quotations marks around the string.

For example, "My Streaming Server" instead of My Streaming Server.

Technical Specifications

- Clients: Streams media to any computer that has QuickTime 4 or later installed. You can download QuickTime client software from the QuickTime Web site at: www.apple.com/quicktime.
- Concurrent connections: Serves up to 2000 users.

Support

Web Sites

Check these Web sites for tips, solutions to problems, or any patches that may become available after the release of the software:

- QuickTime Streaming Server Web site: www.apple.com/quicktime/servers
- Apple Support Web site: www.apple.com/support
- QuickTime Streaming Server Support Web site: http://www.info.apple.com/support/macosxserver/qtss.html

For information on using the QuickTime Proxy Server refer to the QuickTime Streaming Server Support Web site.

QuickTime Streaming Server Mailing List

To receive information about QuickTime Streaming Server updates, join the QuickTime Streaming Server mailing list. Through the list you can share experiences, questions, and comments with others who use the software. Apple employees may monitor the list, but Apple does not guarantee that questions sent to this list will be answered. For more information about joining the mailing list, see the Apple mailing lists Web site at www.lists.apple.com.

Open Source

The Darwin Streaming Server, which is the complete Open Source code for the QuickTime Streaming Server, is server technology that allows you to stream QuickTime media to clients across the Internet using industry-standard RTP and RTSP protocols. For information about the Darwin Streaming Server project, see Apple's Open Source Web site at: www.publicsource.apple.com.

Using QuickTime Player

- The demo version of QuickTime Player provided on your Mac OS X Server computer does not support streaming, hinting, or authoring, so you may be unable to view some QuickTime media using this version of QuickTime Player. To view QuickTime streaming media, you need version 4.0 or later of the QuickTime client software running on Mac OS or Windows. To utilize the authentication features of QuickTime Streaming Server, you need QuickTime Player 4.1 or later. You can download the latest version of QuickTime client software from the QuickTime Web site at: www.apple.com/quicktime.

USB Printer Sharing: Using an Internet Location File

This article explains how to use a Internet Location File with USB Printer Sharing.
This article has been archived and is no longer updated by Apple.

USB Printer Sharing and Routed Networks

USB Printer Sharing uses an industry standard protocol called SLP (Service Location Protocol) to locate shared printers on an IP (Internet Protocol) network. A router can be configured to block all SLP traffic or to block SLP multicast. In either case, USB Printer Sharing will not be able to locate printers that are shared on the other side of the router. In order to use USB Printer Sharing to print through a router that does not pass SLP traffic, you must create a Internet Location File of the shared printer. You use this Internet Location File on the client computer as a link to the shared printer on the other side of the router. For example, PPP (point-to-point protocol) does not pass SLP traffic, so you can not locate printers shared with USB Printer Sharing over a dialup connection.

Using a Internet Location File

After you share a printer from a host computer with USB Printer Sharing, you can create a link to that printer that can be used to access the shared printer from computers that are unable to look up the printer using NSL. To create and use a Internet Location File that links to a shared printer:

1. Open the USB Printer Sharing control panel on the host computer (the computer sharing the printer).

2. Select the My Printers tab.

3. Drag the name of the shared printer out to the desktop.

Doing this creates a printer Internet Location File. See Figure 1.

Figure 1: Internet Location File

4. Transfer the printer Internet Location File to the client computer (Using email, ftp, removable media, etc.)

5. Open the USB Printer Sharing control panel on the client computer.

6. Turn on USB Printer Sharing by clicking the Start button in the Start/Stop tab.

7. Select the Network Printers tab.

8. Drag the printer Internet Location File into the Network Printers tab.

At this point, the USB Printer Sharing control panel on the client computer attempts to initiate an IP connection with the host computer (this can take a few minutes). If the client computer is able to make an IP connection with the host computer, the name of the shared printer appears in the Network Printers tab on the client computer. If the name of the shared printer does not appear in the in the Network Printers tab, it is an indication that the client computer is not able to initiate an IP connection with the host computer.

USB Printer Sharing: Usage and Compatibility

This article contains usage and compatibility information about USB (Universal Serial Bus) Printer Sharing.

This article has been archived and is no longer updated by Apple.

Usage

USB Printer Sharing was designed for small work group environments and is not intended to provide the same complex functionality found on some high-end print spoolers.

Compatibility

The following is a list of compatible printers. Please check with the printer vendor for current compatibility information.

PostScript Printers:

All USB PostScript printers compatible with Desktop Printer Utility 1.2 and LaserWriter 8.7 are compatible with USB Printer Sharing 1.0. This includes USB PostScript printers from Canon, GCC, Hewlett-Packard, Lexmark, Tektronics and Xerox.

Ink Jet Printers:

Alps:

- Please contact Alps for current compatibility information.
  http://www.alpsusa.com/

Brother:

- Please contact Brother for current compatibility information.
  http://www.brother.com

Canon:

- Please contact Canon for current compatibility information.
  http://www.canon.com/
  http://www.canon.co.uk/

Epson

- Please contact Epson for current compatibility information.
  http://www.epson.com/

Hewlett-Packard:

- Please contact Hewlett-Packard for current compatibility information.
  http://www.hp.com/

Lexmark:

- Please contact Lexmark for current compatibility information.
  http://www.lexmark.com

Oki Data:

- Please contact Oki for current compatibility information.
  http://www.okidata.com/

Additional compatibility information is available here:

AirPort Admin Utility 1.2: Network Tab Explained

The Network tab in AirPort Admin Utility 1.2 changed to increase functionality, and to allow for different network configurations. This article explains the features of the revised Network tab.
This article has been archived and is no longer updated by Apple.
The following is a detailed explanation of each option in the Network Tab of the AirPort Admin Utility version 1.2.

Figure 1 AirPort Admin Utility 1.2 Network Tab

Distribute IP addresses

When you select "Distribute IP addresses", options such as DHCP (Dynamic Host Configuration Protocol) and NAT (Network Address Translation) are available. These options are explained in this article.

When this checkbox is unselected, the base station acts as a bridge. This makes the base station pass network traffic from the wireless network to the wired network without manipulation. When you configure the base station to join your two networks in this way, your wireless client computers must each have TCP/IP (Transmission Control Protocol/Internet Protocol) configurations that are valid for the wired network.

Note: You can set up bridging as a troubleshooting step if you think that your Internet Service Provider's (ISP) network does not work with some feature of the base station.

For more information on bridging see article 58597: "**AirPort Base Station: Configuring As A Bridge**".

Share a single IP address (using DHCP & NAT)

This is one of two options you can choose when you select the Distribute Internet Protocol Addresses checkbox.

When you select "Share a single IP Address (using DHCP & NAT)", the Base Station receives an IP Address from your ISP. The Base Station shares this IP address with the wireless clients through NAT. For more information on NAT see article 58514: "**AirPort: What is Network Address Translation?**". When you select this option, the AirPort Base Station also acts as a DHCP server and distributes IP Addresses in the range of 10.0.1.2 to 10.0.1.50.

Note: NAT and DHCP are enabled on the wireless interface of the base station only. Configuring the base station to use NAT and provide DHCP service on the Ethernet interface is discussed below.

Ethernet client computers also share a single IP address (using NAT)

When you select "Ethernet client computers also share a single IP address (using NAT)", it enables NAT on the Ethernet network to which the AirPort Base Station is connected. Some cable and DSL (Digital Subscriber Line) ISPs use a 10.0.1.2-10.0.1.254 addressing scheme, so you should leave this checkbox unselected if you use cable or DSL as your ISP.

Note: If your cable or DSL ISP uses IP addresses outside the 10.0.1.2-10.0.1.254 range, you may not cause any issues with their network if you use this option, but you should contact your ISP before you enable this option.

When you leave this checkbox unselected, only the wireless clients share a single IP Address and use the NAT function of the Base Station.

Important: If you leave "Enable DHCP server on Ethernet" unselected, you must manually configure the TCP/IP settings for the client computers on the wired network as follows:

- IP Address: `10.0.1.x` (where `x` is a number in the range 51 - 254).
- Subnet mask: `255.255.255.0`
- Router address: `10.0.1.1`
- Name server addr: Use the DNS address appropriate for your ISP, i.e. the settings that are being used by the base station.

Share a range of IP addresses (using only DHCP)

This is one of two options you can select when you select the Distribute IP (Internet Protocol) Addresses checkbox.

When you select "Share a range of IP addresses (using only DHCP)", the Base Station is not performing NAT, but instead is distributing a range of IP addresses that are valid for the network to which the base station is connected.

Enable DHCP server on Ethernet

When you select "Enable DHCP server on Ethernet" it enables DHCP services from the Base Station on Ethernet. This checkbox should **not** be

selected if you already have a DHCP Server on your Ethernet network, or if you have a cable modem. This can cause unexpected behavior, including computers losing their connections to the Ethernet network.

Note: Some cable modem ISPs may not be affected by this option. Contact your ISP for more information. Most DSL ISPs are not affected by this option. If you encounter strange behavior, disable this option and see if the behavior persists. Contact your ISP for more information.

When you leave this checkbox unselected, the Base Station provides DHCP services to only the wireless clients.

Note: When you leave this checkbox unselected, you can still take advantage of NAT by manually configuring the TCP/IP settings for the client computers on the wired network. Refer to the section above.

Enable AirPort to Ethernet bridging

When you select "Enable AirPort to Ethernet bridging", all traffic is moved between the wired and wireless side. When this is not selected, for example, a wired client of an AirPort Base Station could not see a wireless client of the base station in the Chooser.

For related information, please see:

Article 106021: "**AirPort: How to Set Up Bridging When Using a Cable Modem**"

Article 106016: "**AirPort: How to Set Up File Sharing Between AirPort and Ethernet Computers**"

Note: Wireless Internet access requires an AirPort Card, AirPort Base Station, and an Internet service provider, for which fees may apply. Some ISPs are not compatible with AirPort. For more information, see technical document 106590: "**AirPort: Requirements for Wireless Internet Access.**"

Published Date: Feb 20, 2012

Mac OS: Launcher Extends Below Bottom of Screen

This article describes an issue where the Launcher window extends beyond the bottom of the screen.
This article has been archived and is no longer updated by Apple.

Symptom

The Launcher window extends below the bottom of the screen.

Solution

When a control panel is opened, the Finder adds a resource to the control panel that stores its window position. This is so that the control panel window will open in the same place the next time the control panel is opened.

The addition of this resource to the Launcher can cause the Launcher to function incorrectly. To correct this, follow these steps:

1. Start up the computer from the Mac OS Install disc.
2. Find the Launcher Items folder in the System Folder of the hard disk.
3. Drag the Launcher Items folder out of the System Folder to the hard disk. **Do not throw it away.**
4. Locate the Launcher Preferences in the Preferences folder, which is in the System Folder on the hard disk.
5. Drag the Launcher Preferences file to the Trash.
6. Locate the Launcher in the Control Panels folder, which is in the System Folder on the hard disk.
7. Drag the Launcher to the Trash.
8. Perform a custom installation of the Launcher from the Mac OS Install disc. (See Note 1.)
9. Open the Control Panels folder in the System Folder on the hard drive and select Launcher.
10. Choose Get Info from the File Menu.
11. Choose General Information from the pop-up menu.
12. Click Locked. Selecting the Locked option prevents the Finder from modifying the file.
13. Start up the computer from the hard disk.
14. Open the Launcher.
15. Close the Launcher.
16. Drag the Launcher Items folder from the hard disk back into the System Folder on the hard disk.

Notes

1. For more information on performing a custom installation, please see the following articles:

Article 31288: "**Mac OS 9: Installing or Removing Individual Components**"
Article 50055: "**Miscellaneous Manuals**". Select Troubleshooting Handbook - Reinstalling Your Computer Software.

Identifying the ports of iBook computers

This article has been archived and is no longer updated by Apple.

Learn about the external ports and connectors for your iBook, with pictures and descriptions.

Because port arrangement varies between iBook models, it is necessary to know which model you have.

iBook models included in this article:

- iBook
- iBook (FireWire)
- iBook (Dual USB)
- iBook (Late 2001)
- iBook (14.1 LCD)
- iBook (16 VRAM)
- iBook (14.1 LCD 16 VRAM)
- iBook (Opaque 16 VRAM)
- iBook (32 VRAM)
- iBook (14.1 LCD 32 VRAM)
- iBook (800 MHz 32 VRAM)
- iBook (900 MHz 32 VRAM)
- iBook (14.1 LCD 900 MHz 32 VRAM)
- iBook G4
- iBook G4 (14-inch)
- iBook G4 (Early 2004) (both sizes)
- iBook G4 (Late 2004) (both sizes)
- iBook G4 (Mid 2005) (both sizes)

Below is a picture of the left side of the original iBook:

Input/output ports on left side of original iBook computers
A Internal 56 Kbps modem
B 10/100 Base-T Ethernet
C USB (Universal Serial Bus) 1.1 port
D Sound output

Below is a picture of the right side of the iBook:

The power adapter port is on the right side of the iBook. When the battery is charging, the power adapter port glows amber. It glows green when the battery is fully charged.

Note: The underside of the iBook contains two charging contacts. For more information on these charging contacts, please see article 58438: "**iBook: Description of Charging Contacts on Underside**."

Below is a picture of the left side of an iBook (FireWire) computer:

Input/output ports on left side of iBook (FireWire) computers, from rear to front:
Internal 56 Kbps modem
10/100 Base-T Ethernet
USB 1.1 port
FireWire 400 port

Sound output

For more information on the sound out and composite video out port, see the following articles:

Article 88041 : "**iBook (FireWire): How to Select a Compatible Composite Video Resolution**"
Article 88040: "**iBook (FireWire): Composite Video Cable Not Interchangeable**" Below is a picture of the left side of the iBook (Dual USB) computer:

Input/output ports of iBook (Dual USB), iBook (Late 2001), and iBook (14.1 LCD) computers

A Kensington security slot
B Internal 56 Kbps modem
C 10/100 Base-T Ethernet
D FireWire 400 port
E two USB 1.1 ports
F RGB video output port
G Audio/video port
H Reset button

Below is a picture of the left side of the iBook (16 VRAM) computer:

The reset button has been removed from the left side panel on iBook (16 VRAM) and later computers. It has been replaced by a keyboard shortcut. To perform a hard reset, simultaneously press Control-Option-Shift-power. For more information on the reset function, see technical document 14449, "**PowerBook and iBook: Resetting Power Management Unit (PMU)**".

Input/output ports of iBook (16 VRAM), iBook (14.1 LCD 16 VRAM), iBook (Opaque 16 VRAM), iBook (32 VRAM), iBook (14.1 LCD 32 VRAM), iBook (800 MHz 32 VRAM), iBook (900 MHz 32 VRAM), iBook (14.1 LCD 900 MHz 32 VRAM), iBook G4, iBook G4 (14-inch), both sizes of iBook G4 (Early 2004), both sizes of iBook G4 (Late 2004), and both sizes of iBook G4 (Mid 2005) computers

1 Internal 56 Kbps modem
2 10/100 Base-T Ethernet
3 FireWire 400 port
4 two USB 1.1 ports (iBook (Early 2004) and iBook (14-inch Early 2004) computers have two USB 2.0 ports)
5 Video output port
6 Sound output port

The power adapter port is on the right side of the iBook (Dual USB) and later iBook computers.

.Mac: How to Add Photos to Messages Sent With WebMail

This document explains how to include a photo in messages sent from Mac.com addresses when using the WebMail service.

This article has been archived and is no longer updated by Apple.

When logged in to Mac.com WebMail, follow these steps:

1. Click on Preferences from any Mac.com WebMail page
2. Click the Photo checkbox to enable that option.
3. Click Choose (located below "Insert Photo Here").
4. Click Browse, navigate to the image you'd like to use, and select it.
5. Click Apply.
6. When you are returned to the Preferences page, click Save (at the bottom of the page).

You can use any square GIF or JPEG image. For the best possible results, use iPhoto or another photo editing application to create a 64- by 64-pixel image.

If you select a new photo signature but you don't see it in the Preferences page, you may need to clear your browser's cache. Once this is done, click Reload or Refresh to refresh the Preferences page and view your updated photo signature.

If recipients can't see your photo, make sure they are using either Mac.com WebMail or the Mac OS X Mail application and that your Photo preference is enabled. The photo seen by a recipient is determined by the state of your preferences at the time they download/view the message, not at the time that you send the message.

.Mac Backup requires membership

If you see an alert telling you that Backup requires a .Mac membership, it could be caused by a network issue, the files you are backing up, or software you have installed.

This article has been archived and is no longer updated by Apple.

Home network

If you have a home network, simplify it by connecting the computer you are using directly to the modem, then try to back up from there. If you are able to do so successfully, some element of your network may be causing the disconnect.

Proxy servers

Contact your ISP to see if it uses proxy servers, which may prevent the Backup application from communicating with the iDisk servers.

Specific files

It is possible that a certain file may be causing the issue.

1. Open Backup.
2. Choose a single item to back up, such as a single QuickPick or your Address Book contacts.
3. Click Backup Now.

   If the error still occurs, continue to the next troubleshooting section. If the file backs up OK, you have found the cause. It's one of the files you are backing up. Try adding more items that you want to back up, and test again. Keep trying until you isolate the item causing the issue. If you create a new file with that data, it will usually resolve the situation and allow you to back up the data.

Norton Internet Security Software

If you have Norton Internet Security Software installed, see Symantec's article on this topic.

Keychain settings

There may be a conflicting or damaged entry in your Keychain.

1. Open Keychain Access. It's in the Utilities folder (/Applications/Utilities).
2. Delete all items whose kind is .Mac password.
3. Open System Preferences and reenter your account information in the appropriate section.

If deleting the Keychain entry does not fix the issue, use Keychain First Aid. Keychain First Aid is available from the Window menu in Mac OS X 10.3, and for Mac OS X 10.1 through 10.2.8, you can download it.

Backup: Requires Internet Connection and .Mac Membership When First Opened

.Mac authentication is only required the first time Backup is opened, and when you back up to iDisk.

This article has been archived and is no longer updated by Apple.

.Mac membership authentication takes place when you first open Backup in order to make sure you have a valid .Mac membership. .Mac membership authentication is also required when you back up to your iDisk.

If you change the backup destination to CD/DVD after authenticating your .Mac membership, the next time you open Backup the authentication process is not required. You don't even need to be online to back up to CD/DVD. However, if the destination is changed back to iDisk, you will be required to authenticate your .Mac membership again.

Note: If you open Backup after the first authentication, you will see an alert box with this message: "iDisk Server is Unreachable. The iDisk server is either unavailable or unreachable. Please try again later." The options are to select "Open Network Prefs" or "OK". If you click "OK", Backup will open with CD/DVD selected.

86096 .Mac: User Name Required to Restore Files Using Backup

Published Date: Oct 10, 2016

.Mac: Backup "You have already backed up another Macintosh using this .Mac account..." Alert

Backup is intended to back up files from one computer to one iDisk at a time. If you try to back up two computers to one iDisk, the alert described in this document appears.
This article has been archived and is no longer updated by Apple.

Symptom

The an alert box with this message appears:

> "You have already backed up another Macintosh using this .Mac account. The information in the iDisk Backup folder from the other computer will be completely erased. Do you want to continue?"

Solution

Backup is intended to back up files from one computer to one iDisk at a time. To back up more than one computer at a time, use one of the following solutions:

- Restore currently backed up files from iDisk to the original computer before continuing.
- Back up to optical media (such as a CD-R/CD-RW or DVD-R disc) instead.
- Before backing up, transfer files that are to be backed up from multiple computers to a single computer, then use Backup to archive the files on that computer.
- Drag files you want to back up to a different folder on the iDisk, such as the Documents folder.
- Use a different .Mac account and iDisk for each computer.

Warning: If you have the same user short name on more than one computer, this alert message will not appear. However, even if it does not, you must not attempt to back up multiple computers to the same iDisk. This may result in unpredictable behavior, including either undesired overwriting of previously stored data or failure (without warning) to save the new data.

.Mac Backup: Some Preference Files Cannot Be Backed Up Because of Incorrect Permissions

Backup cannot back up certain Preference files.
This article has been archived and is no longer updated by Apple.

Symptom

When using the Backup application to try to back up the Preferences folder, an alert appears with this message:

> "Error reading file '/Users/user_name/Library/Preferences/com.apple.preference_name.plist'.
> There was an error reading this file from disk."

The only option is to click OK. Clicking OK results in an unsuccessful backup.

Solution

Some files in a user's Preferences folder may be created with permissions set incorrectly. These permissions prevent Backup from reading preference files with this permissions issue.

As a workaround, you can selectively choose not to back up these files.

1. Drag the Preferences folder from your Home directory into the Backup window.
2. Open the Info drawer so you can deselect individual files. Select the folder, click the Info button, and deselect the files (see Figure 1.)

Figure 1 Backup Info Drawer

Note: Two files that may cause this issue are:

- com.apple.loginwindow.plist
- com.apple.NetInfoManager.plist

You may modify permission settings by entering commands in the Terminal application. Users who are unfamiliar with Terminal and UNIX-like environments should proceed with caution. The entry of incorrect commands may result in data loss and/or unusable system software. Improper alteration of permissions can result in reduced system security and/or exposure of private data. For further information, see technical document 106712, "**Mac OS X: Troubleshooting Permissions Issues**".

iMac (Slot Loading) and Mac OS X 10.2: Screen Effects Stops Responding

After installing Mac OS X 10.2 on an iMac (Slot Loading) computer, Screen Effects may stop responding ("freeze") as it is being configured, or after some period of use.
This article has been archived and is no longer updated by Apple.

Symptom

Screen Effects may stop responding:

- while changing preferences from one screen effect preview to another
- after an extended period of use
- while configuring screen effects

Solution

Update to Mac OS X 10.2.3.

You can update from a previous version of Mac OS X 10.2 by using Automatic Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**". Because some updates are prerequisites for others, you may need to use Software Update more than once to get all desired updates.

An installer is also available from Apple Software Downloads (http://www.apple.com/swupdates/).

iTunes: "None of the items in this playlist can be burned to CD" Alert

AIFF or Audible files cannot be burned to CD as MP3 files.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to burn a CD from a playlist that includes AIFF, Audible.com files, or an audio stream, an alert box with this message appears:

> "None of the items in this playlist can be burned to CD."

Solution

AIFF or Audible files cannot be burned to CD as MP3 files. You must burn them as AIFF or as Audio CDs. To choose Audio CD as the format for burning:

1. Choose Preferences from the iTunes menu for Mac or the Edit menu for Windows.
2. Click Advanced.
3. Click Burning in the toolbar.
4. Click "Audio CD" to enable that option.
   Audio streams (including radio stations in iTunes) cannot be recorded and cannot be burned to any type of disc.

Notes

1. Audible.com allows for a single set of Audio CDs to be created from their purchased content.

2. iTunes software may be used to reproduce materials. It is licensed to you only for reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce. If you are uncertain about your right to copy any material, you should contact your legal advisor.

Mac OS X 10.2: SD/MMC Camera Only Available in "Disk Drive" Mode

Some cameras that use SD/MMC storage can be connected to your Macintosh in two different modes: as a camera, or as a disk drive. In some cases, after using the camera in "Disk Drive" mode, it will no longer be available if you switch to "Digital Camera" mode.
This article has been archived and is no longer updated by Apple.

Symptom

In some cases, after using the camera in "Disk Drive" mode and switching it to "Digital Camera" mode, it may no longer be recognized by Image Capture or iPhoto. This may also occur if you have used the SD/MMC storage card in a FireWire or USB card reader connected to your Macintosh, and then return the card to the camera in "Digital Camera" mode.

Note: Even if iPhoto or Image Capture do not recognize the camera, the pictures on the storage card remain intact. No data has been lost.

Solution

Continue to use the camera in "Disk Drive" mode, and it will remain available in Image Capture and iPhoto.

To restore the card to its original state:

1. Download all images to your Macintosh. Either connect the camera directly while in "Disk Drive" mode, or place the SD/MMC storage card in a FireWire or USB card reader, then download the pictures using Image Capture or iPhoto.
2. After the pictures are downloaded, use the camera to reformat the card.

Important: Reformatting the card will erase all images stored on it.

Additional information

The camera uses different protocols to communicate with your Macintosh in the different modes, but the camera can be recognized by Image Capture and iPhoto in either mode. The only visible difference is the camera appears on the Desktop when it is connected in "Disk Drive" mode.

Apple Remote Desktop: Cannot Connect to Configured Mac OS X Server 10.2

If an Apple Remote Desktop client is a Mac OS X Server hosting Password Server, special configuration may be necessary. Apple Remote Desktop needs to be configured for a user in the server's local domain. That user account must be set to use a Basic password.
This article has been archived and is no longer updated by Apple.

Symptom

When you use Remote Desktop admin on a remote computer, errors occur when you try to add the client server.

Solution

1. Use Workgroup Manager on the server to create a new account in the Local domain.
2. Click the Advanced tab
3. Set this new local user to use a Basic password.
4. Configure the Remote Desktop preference pane to use the new user you just created.

SuperDrive: Important Information About Using With High-Speed Media

This document contains important information about using high-speed discs (4x DVD-R and 2x DVD-RW) with the Apple SuperDrive.
This article has been archived and is no longer updated by Apple.
All SuperDrive-equipped Macs are compatible with 1x and 2x DVD-R discs (media).

The DVD Forum has released specifications for high-speed media for DVD recording (4x for DVD-R and 2x for DVD-RW). One of Apple's suppliers, Pioneer Electronics, Inc., has advised Apple that some of its DVD-R/CD-RW drives (including some Apple SuperDrives) are unable to recognize high-speed media, and that using this media may permanently damage the drive.

Apple, the industry leader in providing affordable and easy-to-use DVD authoring systems, provides a quick and easy way for customers to update their computer's SuperDrive. Apple is making automatic and manual updates available for both Mac OS 9 and Mac OS X before high-speed media becomes widely available. This firmware update enables the SuperDrive to read from and write to high-speed media, but it does not increase the drive's speed; the updated 2x SuperDrive writes to high-speed media at 1x, so you should continue using 2x DVD-R media for best performance. This update also enables you to eject discs that do not comply with the audio CD specification, or that have mastering errors.

Note: All SuperDrive-equipped Macs are compatible with 1x and 2x DVD-R media.

Which Macintosh computers require this update?

- The following SuperDrive-equipped computers may require this update (see below for information on how to determine if your computer needs this update):
    - iMac (Flat Panel) with SuperDrive
    - Power Mac G4 (Digital Audio) with SuperDrive
    - Power Mac G4 (QuickSilver) with SuperDrive
    - Power Mac G4 (QuickSilver 2002) with SuperDrive
- The following SuperDrive-equipped computers include the latest update. They can read from and write to high-speed media. (No update is needed):
    - iMac (17-inch Flat Panel)
    - eMac with SuperDrive
    - Power Mac G4 (Mirrored Drive Doors) with SuperDrive
    - PowerBook G4 (1GHz/867MHz) with SuperDrive
- All Macs with SuperDrive being manufactured as of late 2002 can read from and write to high-speed media, and do not need to be updated.
- For computers that require the update, you can automatically update the SuperDrive via the automatic Software Update feature (for both Mac OS 9 and Mac OS X) to work with high-speed media.
- If you have turned off automatic Software Update, or if you have an environment that doesn't allow automatic Software Update to work, you can download a manual update from Apple's website (see installation instructions below).
- Computers that do not have a SuperDrive, or that have a SuperDrive from a vendor other than Pioneer do not need to be updated.

How can I tell if I need this update?

If you have an iMac (17-inch Flat Panel), eMac with SuperDrive, Power Mac G4 (Mirrored Drive Doors) with SuperDrive, or PowerBook G4 (1GHz/867MHz) with SuperDrive you do not need this update. Your computer's SuperDrive is already compatible with high-speed media. Computers that do not have a SuperDrive do not need this update.

Follow these steps to determine if your computer's SuperDrive needs to be updated:

1. Choose Apple System Profiler from the Apple menu (Mac OS 9), or open it from the Utilities folder (Applications/Utilities) in Mac OS X.
2. Click the Devices and Volumes tab. Locate the CD-RW/DVD-R device listing.
3. Click the disclosure triangle to the left of the device listing to get more information.

- If the Vendor Identification field names a manufacturer other than Pioneer, you don't need this update.
- If the Vendor Identification field names Pioneer as the manufacturer, your drive may need the update.
    - For drives with the Product Identification DVR-104, no update is required if the Device Revision number is A227 or higher.
    - For drives with the Product Identification DVR-103, no update is required if the Device Revision number is 1.90 or higher.

How do I get this update?

To download and install this update via the automatic Software Update feature in Mac OS X, choose System Preferences from the Apple menu, choose Software Update from the View menu, then click Check Now. In Mac OS 9, open the Software Update control panel and click Update Now. Then follow the onscreen instructions to install the update.

- The SuperDrive update for iMac for Mac OS X is available as an automatic Software Update. A manual installer for iMac for Mac OS X is also available from software download document 120161: "**iMac SuperDrive Update for Mac OS X: Information and Download**".
- The SuperDrive update for Power Mac for Mac OS X is available as an automatic Software Update. A manual installer for Power Mac for Mac OS X is also available from software download document 120166: "**PowerMac SuperDrive Update for Mac OS X: Information and Download**".
- The SuperDrive Update for iMac for Mac OS 9 is available as an automatic Software Update. A manual installer for iMac for Mac OS 9 is also available from software download document 120170: "**iMac SuperDrive Update for Mac OS 9: Information and Download**".
- The SuperDrive update for Power Mac for Mac OS 9 is available as an automatic Software Update. A manual installer for Power Mac for Mac OS 9 is also available from software download document 120172: "**PowerMac SuperDrive Update for Mac OS 9X : Information and Download**".

If you feel that you may have damaged your SuperDrive by using high-speed media, contact Apple, or an Apple Authorized Service Provider.

Apple does not provide technical support for third-party DVD-R devices. Contact the manufacturer of your drive for more information. Apple's updater only updates internal Apple-branded SuperDrives that need an update.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

PowerBook G4 (DVI): European Models Don‘t Accept the First Restore CD

Some computers in Europe came with the wrong preloaded software. Affected computers start up with iSelect rather than xSelect. This means they can't use the Software Restore CD set.
This article has been archived and is no longer updated by Apple.

Symptom

The computer does not accept the first Restore CD when you start it up the first time. This makes it impossible to use the Software Restore CD set.

Solution

Start up the computer using the first Mac OS X 10.2 Install CD and perform a clean installation. Be sure to use the "Erase hard disk" option.

If you wish to install Mac OS 9 and other bundled software (such as additional applications) after completing the clean install, continue with the installation by following these steps:

1. Restart from the Mac OS X System folder on the hard disk.
2. Insert the first Restore CD.
3. Double-click the Software Restore icon. The Software Restore process starts automatically.
4. Follow the instructions provided throughout the process to restore all desired software.

Note: A clean installation of Mac OS X 10.2 takes about 50 minutes, while installing both the operating system and other bundled software may take up to 90 minutes.

Mac OS X 10.2: How to Save Custom Terminal Window Settings as a File

This document explains how to save custom Terminal window settings as files.
This article has been archived and is no longer updated by Apple.
You can save custom Terminal window settings as .term files, which are stored in XML format.

Follow these steps to save Terminal window settings as a file:

1. Configure the Terminal window as desired (color, font, size, and so forth).
2. Choose Save from the File menu.
3. Type a unique filename.
4. Choose where you want to save the file. You may save it in the default location (~/Library/Application Support), or in a different location, such as the desktop or your Documents folder. The filename extension ".term" is automatically appended to the filename.

Important: The saved file stores window settings, but not window contents. Instead, choose "Save Text As" from the File menu to save text.

To use a saved .term file, you may double-click it, or choose Open from the File menu in Terminal.

Advanced: executing a command while file opens

To execute a specific command when opening a .term file, add an XML tag to the file with a text editing application such as TextEdit.

For example, if you want connect to a remote server via ssh, add the following to the .term file:

```
<key>ExecutionString</key>
<string>ssh_login_name@domain_or_address</string>
```

Note: This document applies to the Terminal application, located in /Applications/Utilities.

Mac OS X: How to change the Terminal shell

This advanced document explains how to change the shell used in the Terminal application.
This article has been archived and is no longer updated by Apple.
Important: This is an advanced topic. You should use this information only if you are comfortable using Terminal and understand the concept of shells.

The default shell (or command-line interface) used in Mac OS X 10.0 through 10.2.8 is tcsh (with 10.3 and 10.4 it's bash). With Mac OS X 10.2 or later, other interactive shells are included, such as bash and zsh.

To **temporarily** change your shell, type the name of the shell, such as: bash

To revert to the tcsh shell, close the Terminal window and open a new one.

To **permanently** change your default Terminal shell:

1. Choose **Preferences** from the **Terminal** menu.
2. Select the option "Execute this command (specify complete path):"
3. Change the selected text entry from /bin/tcsh to reflect a different Terminal shell, such as:

   /bin/bash
   /bin/csh
   /bin/zsh
   /bin/zsh-4.0.4 (Mac OS X 10.2.8 or earlier)
   /bin/zsh-4.1.1 (Mac OS X 10.3 or later)
   /bin/ksh (Mac OS X 10.4 or later)

4. Close the Terminal Preferences window.
5. Quit and open Terminal again. The first and subsequent new Terminal windows open with the shell that you designated in Preferences.

Power Mac G4 SuperDrive Update: Drive Read/Write Lights Do Not Work After Update

The drive activity indicator lights on SuperDrives with the Pioneer DVR-103 mechanism do not work after you update the firmware using the Power Mac SuperDrive Update.
This article has been archived and is no longer updated by Apple.

Symptom

The read/write indicator lights (LED) on SuperDrives are hidden behind the case plastics of Power Mac G4 computers. On SuperDrive DVR-103 mechanisms with firmware versions 1.22 or 1.33, the drive activity lights are faintly visible behind the plastics. After installing the Power Mac SuperDrive Update available, the drive activity lights no longer work.

Solution

This is expected behavior for any version of the firmware later than version 1.33. It does not affect the SuperDrive's ability to read and write media.

For more information about the SuperDrive Firmware Update, see document 86130, "**SuperDrive: Important Information About Using With High-Speed Media**".

Power Mac G4 (Mirrored Drive Doors) and (QuickSilver 2002) Education Model: About Cable Select and Adding Third-Party Drives

This document discusses the cable select feature of Power Mac G4 (Mirrored Drive Doors) and the education model of Power Mac (QuickSilver 2002) computers, and how it can be used to add drives from third-party manufacturers.
This article has been archived and is no longer updated by Apple.
The Power Mac G4 (Mirrored Drive Doors) and education model of Power Mac G4 (QuickSilver 2002) computers work with ATA and ATAPI internal storage devices that are set for cable select mode.

The cable select feature forces the device to set its ID as either master or slave, based upon its position on the ATA/ATAPI cable:

- If the device is attached to the end of the cable, then it identifies itself as a master.
- If the device is at the middle cable position, then it identifies itself as a slave.

Since cable select mode forces the drive to set its ID based upon its position on the cable, hard drives and optical drives can be easily configured.

When installing additional ATA and ATAPI drives from another manufacturers, check the documentation that came with the drive, or check with the manufacturer to find out how to set the drive to the cable select mode.

Note: For the cable select setting to work properly, the cables you use must work with the cable select feature. For this reason, the original Apple cables that came with the computer should be used when installing additional drives. Some cables made by other manufacturers may not correctly work with the cable select mode.

PowerBook G4 (1 GHz/867 MHz): Using the Software Install and Restore DVD

Use the software install and restore disc that came with your computer to install Mac OS X, Mac OS 9, and the applications that came with your PowerBook G4 (1 GHz/867 MHz) computer.
This article has been archived and is no longer updated by Apple.

To install Mac OS X

1. Back up essential files, if possible.
2. Insert the software install and restore disc that came with the PowerBook G4 (1 GHz/867 MHz) computer.
3. Click the Install Mac OS X icon.
4. Follow the onscreen instructions.
5. After selecting the destination disc for installation, click Options and continue following the onscreen instructions.

To install Mac OS 9 and the applications that came with your computer

1. Back up essential files, if possible.
2. Insert the software install and restore disc that came with the PowerBook G4 (1 GHz/867 MHz) computer.
3. Click the Install Applications & Mac OS 9 icon.
4. Follow the onscreen instructions.

Note: iPhoto, iTunes, and iMovie are part of Mac OS X. To install them, you must follow the directions for installing Mac OS X.

Power Mac G4 Cube: iMovie Doesn‘t Play Movies

If the external USB speakers for the Power Mac G4 Cube computer are not connected, iMovie may not play movies.
This article has been archived and is no longer updated by Apple.

Symptom

When you click the Play button, the movie or clip does not play. When you click the Play Full Screen button a black or blue screen appears.

Solution

Make sure that the external USB speakers (such as the ones included with the Power Mac G4 Cube) are connected during playback.

Apple System Profiler: Modems Reported as V.90 Instead of V.92

On computers with Mac OS X 10.2.2 and v.92-capable modems, Apple System Profiler incorrectly reports the modem as v.90.

This article has been archived and is no longer updated by Apple.

Symptom

In Mac OS X 10.2.2, Apple System Profiler identifies v.92 modems as v.90 modems.

Solution

Apple is working on updating the Apple System Profiler application to properly recognize and report v.92 modems.

Published Date: Feb 19, 2012

VGA Monitors: Which Macintosh Models Are Compatible, Part 2

This article has been archived and is no longer updated by Apple.

This article explains which Macintosh computers introduced since November 1997 work with VGA monitors.

For computers introduced before November 1997, see "VGA Monitors: Which Macintosh Models are Compatible".

Most Macintosh computers work with VGA monitors, including:

Desktop Computers

- Power Macintosh G3 - all models
- Power Macintosh G3 (Blue and White)
- Power Mac G4 - all models
- Power Mac G5 - all models
- iMac DV models for video mirroring
- iMac (Flat Panel) - all models for video mirroring (with included adapter)
- iMac G5 - all models for video mirroring (with included adapter)
- eMac - all models for video mirroring

PowerBook Computers

- PowerBook G3
- PowerBook G3 Series
- PowerBook G3 Series (Bronze keyboard)
- PowerBook (FireWire)
- PowerBook G4 - all models (some require adapter)
- iBook (Dual USB) and later - all models (require adapter)

Making the Connection

To connect a VGA monitor to the computer's video port, an adapter may be required. Some adapters, such as those required for use with an iBook, may have been provided with the computer or may be available for purchase from the Apple Store. Third-party cable vendors may also have these adapters available for purchase. Some computers use a VGA-style connector and do not need an adapter. Refer to your computer's owner guide or Mac OS Help for additional information on connecting a VGA monitor to your computer. For information on display adapters, see "Display Adapter Table".

VGA monitors may have variances when purchased from different VGA monitor vendors. It is best to test a monitor for compatibility with your Macintosh before making a purchase decision. VGA monitors also have different image quality specifications. There may be significant differences between different models of monitor.

QuickBooks: Requires Registration With Intuit

QuickBooks New User Edition 5.0 for Mac, which is included with PowerBook G4 (12-inch) and (17-inch) computers sold in North America, must be registered with Intuit.

This article has been archived and is no longer updated by Apple.

Symptom

QuickBooks New User Edition 5.0 for Mac, which is included with PowerBook G4 (12-inch) and (17-inch) computers, must be registered with Intuit. You can open QuickBooks 25 times without registering, but if you try to open it after that, a dialog with this message appears: "QuickBooks New User Edition 5.0 for Mac requires you to register before your 25th use of this". See Figure 1.

Figure 1 Expired trial dialog box

Products affected

- QuickBooks New User Edition 5.0 for Mac
- PowerBook G4 (12-inch) sold in North America
- PowerBook G4 (17-inch) sold in North America

Solution

To register QuickBooks, call Intuit at 1-800-924-3894.

Online support is available at Intuit's website (http://www.intuit.com/support).

Important: Mention of third-party websites and products is for informational purposes only and constitutes neither an endorsement nor a recommendation. PowerBook G4, iBook: Combo Drive Does Not Write CD-R Media at Maximum Speed

Combo drives in PowerBook G4 and iBook computers write for a longer time than expected, or do not offer the maximum write speed specified for the drive.

This article has been archived and is no longer updated by Apple.

Symptom

The computer does not write CD-R discs at the maximum speed, even though the discs are labeled as being capable of writing at higher speeds.

Solution

Use CD-R discs that are capable of writing at 16x speed. The 16x or maximum option should be selected, if available, prior to inserting a blank disc. If so, the Combo drive is behaving correctly.

Combo drives included with iBook and PowerBook computers can detect imbalances in the disc that are caused by poor production quality or the presence of labels and ink on the disc's surface. These imbalances can cause write errors. When blank discs are initialized, if imbalances are detected the writing speed is slowed to between 4x and 8x write speeds (depending on the magnitude of the imbalance) in order to reduce the potential for write errors.

Mac OS 9.2, Power Mac G4: About This Computer Displays Inaccurate Memory Allocations

When more than 1.5 GB RAM is installed in certain Power Mac G4 computers, the About This Computer memory usage window displays inaccurate information, such as the Mac OS taking a large amount of RAM.
This article has been archived and is no longer updated by Apple.

Symptom

When more than 1.5 GB RAM is installed in certain Power Mac G4 computers, the About This Computer window displays inaccurate memory usage information.

Solution

Mac OS 9 makes use of up to 1.5 GB of RAM. To make use of more than 1.5 GB RAM, use Mac OS X.

Related Documents

FireWire 800: Some Sony Cameras Do Not Register When Connected to Macintosh

Some Sony DFW-VL500 cameras may not register as connected when they are, in reality, connected to the computer's FireWire 800 port.

This article has been archived and is no longer updated by Apple.

Symptom

A Sony DFW-VL500 camera does not register as connected to the FireWire bus when it is connected to a Macintosh computer's FireWire 800 port.

Solution

- Connect the camera to the computer using the FireWire 400 port.

or

- Connect another FireWire 800 device to the computer and connect the Sony camera to the other device.

Bluetooth: Macintosh Computers With Built-In Bluetooth

This article has been archived and is no longer updated by Apple.

Learn which Macintosh computers are available with built-in Bluetooth modules.

Any Macintosh computer with Mac OS X 10.2 or later and a USB port is Bluetooth capable. Bluetooth software is built in to Mac OS X 10.2 and later, and you can buy a USB Bluetooth adapter if Bluetooth isn't already built-in.

Some Macintosh computers come with a built-in Bluetooth interface:

- PowerBook G4 (12-inch) - all models
- PowerBook G4 (15-inch FW 800) and later models
- PowerBook G4 (17-inch 1.33GHz) and later models
- MacBook Pro (15-inch) and later models
- MacBook Pro (17-inch) and later models
- MacBook - all models
- iMac G5 - all models
- iMac (Early 2006)
- iMac (17-inch Late 2006)
- iMac (20-inch Late 2006)
- iMac (24-inch)
- Mac mini - some models
- Mac mini (Late 2005) - some models
- Mac mini (Early 2006) - some models
- Mac mini (Late 2006)

Others have the built-in Bluetooth interface available as a customizable option from the Apple Store:

- Power Mac G4 (FW 800)
- iMac (17-inch 1GHz)
- iMac (USB 2.0)
- eMac (USB 2.0)
- eMac (2005)
- Power Mac G5 and later models
- iBook G4 and iBook G4 (14-inch) and later models

For more information on the Bluetooth technology, see What is Bluetooth?.

Mac OS X 10.2: "Ignore trackpad when mouse is present" Doesn‘t Work As Expected

The Mouse preference pane option to "Ignore trackpad when mouse is present" for PowerBooks and iBooks may not work when non-Apple mice or newer models of Apple mice are connected to the computer.

This article has been archived and is no longer updated by Apple.

Symptom

The trackpad continues to work even though the "Ignore trackpad when mouse is present" option is enabled and a mouse is connected.

Solution

If you are using a third-party mouse and have installed software for it, the driver may not recognize this setting in the Mouse preference pane. In these cases you should contact the vendor of the mouse.

If you are using a later model Apple Pro Mouse (including all white optical mice and black optical mice with white cables), this setting may not work. If available, you can use an earlier Apple mouse to avoid the issue.

Power Mac G4 (FW 800), PowerBook G4 (17-inch): WiebeTech DriveDock Hard Drives May Not Appear On Desktop

WiebeTech FireWire 400 external hard drives may not appear on the desktop.

This article has been archived and is no longer updated by Apple.

Symptom

When connected to the FireWire 400 port, a WiebeTech DriveDock drive may not appear on the desktop if an especially long or thin FireWire cable is used--even if it complies with the IEEE 1394 specification.

Note: This issue also occurs on the FireWire 800 port if a FireWire 400 to FireWire 800 adapter cable is used to connect a WiebeTech FireWire drive to the FireWire 800 port.

Solution

You should use the shortest (1m or less), thickest (approximately 4.5mm) FireWire cable available. WiebeTech is aware of this issue. Future models of their FireWire drives should not have this issue.

For more information regarding this issue, please contact WiebeTech at:

Mail Address	WiebeTech LLC 4153 N. Parkwood Wichita, KS 67220 USA

Power Mac G4 (FW 800): Apple Pro Speakers Not Recognized at Startup or Wake From Sleep

When you restart or wake the computer, an alert message says the speakers are not recognized, but they seem to work correctly.
This article has been archived and is no longer updated by Apple.

Symptom

A limited quantity of Power Mac G4 (FW 800) computers may display this message after the computer starts up or wakes from sleep:

> "Speaker Connection - The device plugged into the Apple speaker mini-jack cannot be recognized. Remove the plug from the jack. Then plug it back in and make sure it is fully inserted."

Figure 1 Alert message

Note: While the computer may exhibit this alert message, the Apple Pro Speakers work correctly.

Solution

1. Close the alert by clicking OK.
2. Make sure the speaker connector is fully inserted into the Apple Speaker sound output port.
3. Restart the computer. If the message reappears after the computer has restarted, the logic board may need to be replaced.
Note: It may take up to nine seconds for this message to appear after the computer has started up.
4. If the message reappears after restarting the computer, contact a local Apple Authorized Service Provider to determine whether the logic board needs to be replaced.

Published Date: Oct 10, 2016

Power Mac G4, Power Mac G5: Computer restarts after being shut down

This article has been archived and is no longer updated by Apple.

A Power Mac G4 (Mirrored Drive Doors), Power Mac G4 (FW 800) or Power Mac G5 computer may restart after the computer has been shut down when it is connected to certain third-party VGA and DVI displays using the DVI connector on the computer.

Symptom

The computer restarts after it is shut down. This occurs when certain third-party VGA and DVI displays are connected to the computer's digital video interface (DVI) port.

This does not affect displays that use the Apple Display Connector (ADC).

Solution

Although rare, some third-party displays deviate significantly from the industry design standards for the implementation of the DDC (Display Data Channel) clock signal.

If your computer restarts after shutdown or wakes after being put to sleep with certain displays connected to the DVI port, these symptoms can be prevented by connecting the display to the video card's ADC port instead of the DVI port.

It may be necessary to purchase an ADC to VGA or ADC to DVI adapter cable. Companies offering ADC to VGA or ADC to DVI adapters include:

Product	Company	Website
VGA Extractor for ADC	Dr. Bott, LLC	http://www.drbott.com/
ADC to VGA Adapter	Gefen Inc.	http://www.gefen.com/
ADC to DVI Adapter	Apple Computer	http://store.apple.com/

Once you have an adapter:

1. Disconnect the display and any adapters from the DVI port on the back of the computer.
2. Connect the appropriate ADC to VGA or ADC to DVI adapter to the ADC port on the back of the computer.
3. Connect the display to the adapter cable.
4. Turn on the computer and verify that it starts up correctly.
5. Choose Shut Down or Sleep from the Apple menu and verify that the computer responds correctly.

   Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Number of bullets don‘t match characters in .Mac password

When you type your .Mac (pronounced "dot Mac") password in System Preferences, it seems to save it with too many dots or bullets.
This article has been archived and is no longer updated by Apple.
You'll see ten bullets or dots in the .Mac password field in System Preferences regardless of the number of actual characters in your password.

This is an intentional security measure. If someone else looks at your settings, they won't know how many characters are in your password because the field always shows ten dots, no matter how long or short your password is.

Desktop Macintosh: Power, Reset, and Interrupt Buttons, Part 2

This article has been archived and is no longer updated by Apple.

General Information: Power Buttons
The power button on modular Macintosh models is typically located on the back of the computer close to the right or left side (depending on the model).

Power buttons come in different shapes and sizes. Some are push buttons (round or square), which may be plain, or may include a sideways triangle or a circle with a small straight line inside. Others are toggles, which include a 1 and a 0 (1=On, 0=Off).

General Information: Reset and Interrupt Buttons
The reset and interrupt buttons are located in different areas on different models. Refer to model-specific descriptions below.

The reset button is marked with a small triangle as shown below. Pushing the reset button restarts the computer.

The interrupt button is marked with a circle; if the button is large enough there is a crooked line in the circle, as shown below. It is used by software programmers when writing applications and debugging them.

In some more recent systems, there may not be unique reset or interrupt buttons. In some systems, the power button doubles as a reset and/or interrupt button. Refer to model-specific descriptions for details.

Reset button icon

Interrupt button icon

Keyboard Commands

If the computer does not have a reset button, press the Command-Control-power keys instead.

If the computer does not have an interrupt button, press the Command-power keys instead.

Professional Models

Model	Power Button Location	Reset/Interrupt Location
Power Macintosh G3 Desktop Power Macintosh G3 Mini Tower	Front panel	Use keyboard commands
Power Macintosh G3 All-In-One	Rear panel	Use keyboard commands
Power Macintosh G3 (Blue and White) Power Mac G4 (PCI Graphics) Power Mac G4 (AGP Graphics)	Front panel	Front panel or use keyboard commands

Mac OS X and PowerBook G4 (12-inch): Dutch DVD Player Help Alert Messages

If Dutch is the preferred language on the PowerBook G4 (12-inch) computer, DVD Player Help may display alert messages saying that the requested information is not found or that there was a "problem" connecting to the Internet.
This article has been archived and is no longer updated by Apple.

Symptom

When you try to use the DVD Player Help, an alert box appears. The text varies depending on whether the computer is connected to the Internet.

- If the computer is not connected to the Internet, the alert text reads:
  "Waarschuwing: Deze informatie bevindt zich op het internet. Wilt u verbinding maken met het internet en deze informatie bekijken?" (See Figure 1.)
  ("The requested information is on the internet. Do you want to connect to the internet to retrieve it?")

Figure 1 Alert Text if Not Connected to the Internet

- If the computer is connected to the Internet, the alert text reads:
  "Waarschuwing: De verzochte informatie is niet gevonden of er heeft zich een probleem voorgedaan bij het maken van een internetverbinding. Probeer het opnieuw of controleer uw internet- en netwerkinstellingen." (See Figure 2.)
  ("The information you were looking for was not found or there was a problem connecting to the internet. Check your Internet and Network settings.")

Figure 2 Alert Text if Connected to the Internet

Solution

These alert messages can be ignored. To access the DVD Player Help, do the following:

- If the computer is not connected to the Internet, press the Annuleer (Cancel) button in the alert message.
- If the computer is connected to the Internet, press the OK button in the alert message.

Published Date: Feb 20, 2012

Macintosh: Apple Internal Modem Cannot Establish or Maintain Connection to Some Scandinavian ISPs

Some Apple internal modems cannot establish or maintain a connection to some Scandinavian Internet service providers (ISPs).

This article has been archived and is no longer updated by Apple.

Symptom

The computer's built-in Apple modem tries to connect to an ISP but disconnects during negotiation or shortly after the connection is made.

ISPs affected

- Rix Telecom
- Telenordia (university users only connecting using phone number 08-58722255)
- Sonera
- Song network
- RSLcom
- Suomen_2G

Solution

For computers with Mac OS X 10.2:

Update to Mac OS X 10.2.5 or later.

For computers with Mac OS 9, Mac X 10.0 or 10.1:

The modem update at http://www.asia.apple.com/modemupdater/ was originally developed for Australian customers, but it may resolve your connection issues.

If the above fixes do not resolve the issue, try this step regardless of which version of the Mac OS you are using:

In Mac OS X:

1. Choose Apple menu > System Preferences.
2. Choose View > Network.
3. Choose Internal Modem from the Show pop-up menu.
4. Click the Modem tab
5. Choose Apple Internal 56K Modem (v.34) from the Modem pop-up menu.

In Mac OS 9:

1. Open the Modem control panel
2. Choose Apple Internal 56K Modem (v.34) from the Modem pop-up menu.

Changing the script to Apple Internal 56K Modem (v.34) may resolve the issue, but be aware that it will slightly reduce the modem connection speed.

This document will be updated as more information becomes available.

Note: This issue applies only to the ISPs listed above. For regular modem troubleshooting, see technical document 106748, "**Mac OS X: Troubleshooting a Dial-Up/PPP Internet Connection**".

Using the Software Install and Restore DVD with PowerBook G4 (12-inch)

This article has been archived and is no longer updated by Apple.

Use the software install and restore disc that came with your computer to install Mac OS X, Classic Support, or the applications that came with your PowerBook G4 (12-inch) computer. You can also use the DVD to restore your computer to its original factory settings.

When installing software onto a portable computer, make sure the power adapter is connected during the process to ensure an uninterrupted installation.

If you need to restore the computer to original factory settings, back up all essential files prior to beginning the installation.

To install Mac OS X

1. Insert the software install and restore disc that came with the PowerBook G4 (12-inch) computer.
2. Double-click the Install Mac OS X icon.
3. Follow the onscreen instructions.
4. Select the destination disc for installation, and then click Options.
5. Continue following the onscreen instructions. If you would like to restore your computer to its original factory settings, select Erase and Install. In most cases, choose Mac OS Extended (HFS Plus). To continue restoring your computer to the original factory settings, follow the instructions below for installing Classic Support and applications.

Note: To use Mac OS 9 applications in the Mac OS X Classic environment, you will need to reinstall Classic Support. See the instructions below for installing Classic Support.

To install Classic Support or the applications that came with your computer

1. Insert the software install and restore disc that came with your computer.
2. Double-click the Install Applications & Classic Support icon.
3. Follow the onscreen instructions. If you would like to restore the computer to the original factory settings, select Restore All.

Note: iCal, iPhoto, iTunes, iChat and iMovie are part of Mac OS X. To install them, you must follow the instructions for installing Mac OS X.

Quitting the Installer

If you need to quit the Installer before the installation process is complete, choose Quit from the Installer menu and click Restart, then hold down the mouse or trackpad button to eject the Software Install and Restore disc. You may be able to eject the disc by pressing the eject button on a tray-loading optical drive or the Media Eject key on the keyboard. Your computer restarts using your current startup disk.

Note: If you have already clicked Upgrade or Install, wait until installation finishes.

Erasing and formatting your disk

When you install Mac OS X, you can erase the destination disk. In the "Select a Destination" pane of the Installer, click the Options button. Select Erase and Install and then choose a format. In most cases, choose Mac OS Extended (HFS Plus).

You can also divide your hard disk into several partitions before you install Mac OS X. In the Installer menu, choose Open Disk Utility and click Partition. Partitioning the disk erases the entire hard disk, so be sure to back up your files first. To install Classic Support or the applications that came with your computer onto a specific partition, the partition must contain Mac OS X. You must start up the computer from that partition and then run the installation process.

Important: Do not choose UNIX File System (UFS) as the format for the destination disk unless you need to work with this format. If you choose UNIX File System, you must install Mac OS X, Classic Support and your Mac OS 9 applications on a Mac OS Extended format disk to use them with the Classic environment.

Upgrading your applications and other software

Use Software Update to download and install the latest software versions, drivers, and other enhancements from Apple. If you are connected to the Internet, Software Update automatically alerts you when an update is available. You can also check for updates manually by choosing Apple menu > System Preferences and then View > Software Update.

For best results with Mac OS X, upgrade your applications to versions that are designed for Mac OS X. Check the Mac OS X website for information about available Mac OS X applications (http://www.apple.com/macosx/). You should also check with developers for the latest versions of your applications.

Using the Software Install and Restore DVD with PowerBook G4 (12-inch)

This article has been archived and is no longer updated by Apple.

Use the software install and restore disc that came with your computer to install Mac OS X, Classic Support, or the applications that came with your PowerBook G4 (12-inch) computer. You can also use the DVD to restore your computer to its original factory settings.

When installing software onto a portable computer, make sure the power adapter is connected during the process to ensure an uninterrupted installation.

If you need to restore the computer to original factory settings, back up all essential files prior to beginning the installation.

To install Mac OS X

1. Insert the software install and restore disc that came with the PowerBook G4 (12-inch) computer.
2. Double-click the Install Mac OS X icon.
3. Follow the onscreen instructions.
4. Select the destination disc for installation, and then click Options.
5. Continue following the onscreen instructions. If you would like to restore your computer to its original factory settings, select Erase and Install. In most cases, choose Mac OS Extended (HFS Plus). To continue restoring your computer to the original factory settings, follow the instructions below for installing Classic Support and applications.

Note: To use Mac OS 9 applications in the Mac OS X Classic environment, you will need to reinstall Classic Support. See the instructions below for installing Classic Support.

To install Classic Support or the applications that came with your computer

1. Insert the software install and restore disc that came with your computer.
2. Double-click the Install Applications & Classic Support icon.
3. Follow the onscreen instructions. If you would like to restore the computer to the original factory settings, select Restore All.

Note: iCal, iPhoto, iTunes, iChat and iMovie are part of Mac OS X. To install them, you must follow the instructions for installing Mac OS X.

Quitting the Installer

If you need to quit the Installer before the installation process is complete, choose Quit from the Installer menu and click Restart, then hold down the mouse or trackpad button to eject the Software Install and Restore disc. You may be able to eject the disc by pressing the eject button on a tray-loading optical drive or the Media Eject key on the keyboard. Your computer restarts using your current startup disk.

Note: If you have already clicked Upgrade or Install, wait until installation finishes.

Erasing and formatting your disk

When you install Mac OS X, you can erase the destination disk. In the "Select a Destination" pane of the Installer, click the Options button. Select Erase and Install and then choose a format. In most cases, choose Mac OS Extended (HFS Plus).

You can also divide your hard disk into several partitions before you install Mac OS X. In the Installer menu, choose Open Disk Utility and click Partition. Partitioning the disk erases the entire hard disk, so be sure to back up your files first. To install Classic Support or the applications that came with your computer onto a specific partition, the partition must contain Mac OS X. Xserve (Slot Load): Power Consumption and Thermal Output (BTU) Information

This document provides power consumption and thermal output information for Xserve (Slot Load) computers.
This article has been archived and is no longer updated by Apple.

Xserve (Slot Load) single processor "minimum" configuration **Configuration**: 1.33 GHz G4 Processor, 1 GB RAM, 60 GB Apple Drive Module, (2) gigabit Ethernet ports, CD-ROM, VGA Display			
Power Consumption		**Thermal Output**	
Idle	**Max**	**Idle**	**Max**
92 W	94 W	314 BTU/h	321 BTU/h
Xserve (Slot Load) single processor "maximum" configuration **Configuration**: 1.33 GHz G4 Processor, 1 GB RAM, one 60 GB and three 120 GB Apple Drive Modules, (2) gigabit Ethernet ports, ATI Radeon 7500 Graphics card (ADC/VGA), CD-ROM, 2 PCI cards			
Power Consumption		**Thermal Output**	
Idle	**Max**	**Idle**	**Max**
145 W	187 W	496 BTU/h	639 BTU/h
Xserve (Slot Load) dual processor "minimum" configuration **Configuration**: Dual 1.33 GHz G4 Processor, 1 GB RAM, 60 GB Apple Drive Module, (2) gigabit Ethernet ports, VGA display, CD-ROM			
Power Consumption		**Thermal Output**	
Idle	**Max**	**Idle**	**Max**
133 W	134 W	453 BTU/h	459 BTU/h
Xserve (Slot Load) dual processor "maximum" configuration **Configuration**: Dual 1.33 GHz G4 Processor, 1 GB RAM, one 60 GB and three 120 GB Apple Drive Modules, (2) gigabit Ethernet ports, ATI Radeon 7500 Graphics card (ADC/VGA), CD-ROM, 2 PCI cards			
Power Consumption		**Thermal Output**	
Idle	**Max**	**Idle**	**Max**
188 W	244 W	642 BTU/h	833 BTU/h

Notes:

1. Max in table is maximum processor utilization.

2. 180GB Apple Drive Modules use the same power consumption and thermal output as 120GB modules.

Xserve RAID: How to Install Active Transceivers in the Host Computer

This document explains how to install Active Transceivers on the host side and avoid communication errors.
This article has been archived and is no longer updated by Apple.

Symptom

Communication errors may occur if an Active Transceiver is installed after the host computer has completed starting up.

Solution

At system startup, the Fibre Channel card determines which transceiver is connected. If there is no module connected, it defaults to Passive Transceiver. If an Active Transceiver is connected after the server starts up, the amplitude is too high for the transceiver, which can result in communication errors with the Fibre Channel devices. Follow these steps to avoid this issue.

Proper Installation of the Active Transceiver

1. Turn off the host computer.
2. Install the Apple Fibre Channel PCI card.
3. Install the Active SFP Transceiver module into one of the SFP ports on the Fibre Channel card.
4. Turn on the host computer.

Xserve RAID: Frequently Asked Questions (FAQ) (2 of 2)

This document contains frequently asked questions (FAQ) regarding Xserve RAID, with answers to those questions. Additional documents are listed at the bottom of this document.
This article has been archived and is no longer updated by Apple.
Questions answered in this document:

1. What are the two Fibre Channel ports on the Xserve RAID used for?
2. At what speed do the Fibre Channel ports transfer data?
3. Which Fibre Channel card for the host computer is available from Apple?
4. Which computers can act as host to the Xserve RAID?
5. In what slot of the Xserve must the Apple Fibre Channel card be installed?
6. In what slot of the Power Mac G4 computer can the Apple Fibre Channel card be installed?
7. In what slot of the Power Mac G5 computer can the Apple Fibre Channel card be installed?
8. How many ports are on the Apple Fibre Channel card?
9. One Xserve RAID can be connected directly to either one or two hosts. How do you connect to one host?
10. How many Xserve RAID arrays can you see from the one host?
11. How do you connect two hosts to an Xserve RAID?
12. How many Xserve RAID arrays can you see from each of two hosts?
13. How do you connect the Xserve RAID to a hub or switch?
14. What kind of Fibre Channel cable comes with the Apple Fibre Channel PCI card?
15. What type of Fibre Channel cable can be used?

Question 1: What are the two Fibre Channel ports on the Xserve RAID used for?

Answer: The two Fibre Channel ports are used to connect the Xserve RAID to the host computer(s), thereby achieving Fibre Channel speed for data transfer.

Question 2: At what speed do the Fibre Channel ports transfer data?

Answer: The Fibre Channel ports transfer data at up to 2 Gb/s (gigabits per second). The controller will auto-negotiate itself to a lower speed in the event that the link partner is configured for 1 Gb/s operation.

Question 3: Which Fibre Channel card for the host computer is available from Apple?

Answer: The Apple Fibre Channel PCI card is a 64-bit, 66 MHz card with dual SFP 2 GB Fibre Channel ports; compatible with 64-bit, 33 MHz slots.

Question 4: Which computers can act as host to the Xserve RAID?

Answer: The Xserve RAID can be hosted by Xserve and Power Mac G4 computers with 800 MHz or faster microprocessor speed running Mac OS X 10.2.4 or Mac OS X Server 10.2.4.

Question 5: In what slot of the Xserve must the Apple Fibre Channel card be installed?

Answer: In G4-based Xserves, the Apple Fibre Channel card has been EMI certified for use in the top PCI slot only. In Xserve G5, the Apple Fibre Channel card can be installed in either of the two PCI slots.

Question 6: In what slot of the Power Mac G4 computer can the Apple Fibre Channel card be installed?

Answer: The card can be installed in any of the PCI slots on the Power Mac G4 computer.

Question 7: In what slot of the Power Mac G5 computer can the Apple Fibre Channel card be installed?

Answer: The card can be installed in any of the PCI or PCI-X slots (depending on purchased configuration) on the Power Mac G5 computer.

Question 8: How many ports are on the Apple Fibre Channel card?

Answer: There are two ports on the Apple Fibre Channel card.

Question 9: One Xserve RAID can be connected directly to either one or two hosts. How do you connect to one host?

Answer: Use two Fibre Channel cables from the host computer to the Xserve RAID. Connect one port on the host Fibre Channel card to the port on one of the Xserve RAID controller modules. Connect the other port on the host Fibre Channel card to the port on the second controller module.

Question 10: How many Xserve RAID arrays can you see from the one host?

Answer: A single host can see up to six arrays per Xserve RAID--three per side.

Question 11: How do you connect two hosts to an Xserve RAID?

Answer: Install a host Fibre Channel card in each host computer and use one Fibre Channel cable from each host to the Xserve RAID. Connect one Fibre Channel cable to the port on one Xserve RAID controller module. Connect the other Fibre Channel cable to the port on the second controller module.

Question 12: How many Xserve RAID arrays can you see from each of two hosts?

Answer: Two hosts can see up to three arrays per host.

Question 13: How do you connect the Xserve RAID to a hub or switch?

Answer: To connect the Xserve RAID to a hub or switch, install a Fibre Channel card in a host and use one Fibre Channel cable from the host to the hub or switch. If you use two cables to connect the Fibre Channel card to the hub or switch, you may see two images (duplicates) of all devices on the hub or switch.

Question 14: What kind of Fibre Channel cable comes with the Apple Fibre Channel PCI card?

Answer: The Apple Fibre Channel PCI card ships with two 2.9 m Copper Fibre Channel SFP to SFP (small form factor pluggable) interconnect cables. See 32493 for more information.

Question 15: What type of Fibre Channel cable can be used?

Answer: Both copper and optical Fibre Channel cable can be used. Be aware that connectors on hubs and switches may differ from connectors on the cable provided with the Xserve RAID.

Xserve RAID: Importance of Installing Backup Battery Modules

This document contains information that highlights the importance and advantage of installing the optional Backup Battery Modules in Xserve RAID.
This article has been archived and is no longer updated by Apple.
Backup Battery Modules (also called Cache Backup Battery Modules) are highly recommended to prevent data loss in the event of power failure and should be considered mandatory for business-critical data.

The Backup Battery Modules are redundant hot-swappable modules that provide power to the RAID controller cache for up to 72 hours in the event of an input power failure. When power is restored, Xserve RAID flushes the data protected in the RAID controller cache to the hard drives, preventing loss of the last transaction's data.

Note: Without a UPS connected to at least one of the power supplies, the Cache Backup Battery modules will backup the controller cache, but you could experience data loss if you do not set the Drive Write Cache to Off.

iMac (17-inch 1GHz): Memory Specifications

This document explains what type and speed of memory (RAM) is used in iMac (17-inch 1GHz) computers.

This article has been archived and is no longer updated by Apple.

iMac (17-inch 1GHz) computers only work with PC2100, 2.5V, 266 MHz DDR SDRAM. The maximum installed RAM that can be used is 1 GB. RAM modules of 128 MB, 256 MB and 512 MB can be used in both slots.

There are two RAM slots in the iMac (17-inch 1GHz) computers. They are:

- A user-accessible 200-pin SO-DIMM slot
- An internal (factory-installed) 184-pin DIMM slot

The Apple System Profiler will show the two different types of slots and what amount of RAM is installed there.

The user-accessible slot requires PC2100 266 MHz speed DDR SDRAM SO-DIMMs. When installing larger 256 MB or 512 MB DIMMs in this slot, use low-profile SO-DIMMs.

Always follow the installation instructions for memory and AirPort Extreme Card as written. They are available in technical document 26264, "**iMac (17-inch 1GHz): Customer-Installable Parts Instructions**". Never try to remove screws that are not listed in the upgrade instructions.

Warning: While you may add or change memory in the SO-DIMM slot, do not try to access the factory-only memory slot. Special seals and tools are required to access and reseal the computer successfully. If the computer is incorrectly resealed, it will be damaged. Any necessary repairs would not be covered under warranty.

The services of an Apple Authorized Service Provider or Apple itself is required to install additional memory into the factory-only accessible memory slot. The service and support information that came with your computer provides instructions on locating an Apple Authorized Service Provider or contacting Apple for this service.

When installing any additional memory you risk damaging your computer. Carefully follow all instructions to avoid damage to your computer when installing memory into the SO-DIMM slot. Any damage resulting from your installation is not covered by the limited warranty on your computer. See an Apple Reseller or Apple Authorized Service Provider for additional information about this or any other warranty question. Apple does not provide telephone support for memory upgrades.

How to turn off the PowerBook G4 (17-inch), (15-inch FW 800) ambient light sensor automatic brightness adjustment

Learn how to activate and deactivate the automatic brightness adjustment of the display backlight and keyboard illumination on some PowerBook G4 (15-inch FW 800) and later models of 15-inch PowerBook as well as all models of 17-inch PowerBook G4.

This article has been archived and is no longer updated by Apple.

There is no single control to deactivate the Ambient Light Sensor (ALS) system. The automatic adjustment of the display and keyboard are set independently.

Follow these steps to turn the automatic display brightness feature on or off:

1. From the **Apple** menu, choose **System Preferences.**
2. From the **View** menu, choose **Displays**.
3. Click the "Automatically adjust brightness as ambient light changes" checkbox.

Follow these steps to turn the automatic keyboard brightness feature on or off:

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Keyboard.**
3. Click the "Illuminate keyboard in low light conditions" checkbox.

You can also turn on or off the keyboard illumination feature by pressing the F8 key. This selection appears in the Keyboard pane of System Preferences.

These keys only respond in this way when the ALS is turned on. If you press the keyboard illumination control keys (F8, F9 and F10) and you see a dimmed graphic with the prohibitory sign (see below), the sensed ambient light is not low enough for the keyboard illumination to work.

Note: Not all 15-inch models of PowerBook G4 include the backlit keyboard and ambient light sensor. To determine if your model includes these features see if the F8, F9, and F10 keys have the ambient light sensor icons printed on them.

If these icons are not printed on the keys, then these features are not present in your model.

Published Date: Oct 10, 2016

About Adjusting Brightness on Ambient Light Sensor (ALS)

This document describes the brightness adjustments for the PowerBook G4 (17-inch), PowerBook G4 (17-inch 1.33GHz), PowerBook G4 (17-inch 1.5GHz), PowerBook G4 (15-inch FW 800), or PowerBook G4 (15-inch 1.5/1.33GHz) computer's Ambient Light Sensor (ALS).

This article has been archived and is no longer updated by Apple.

On these PowerBook G4 computers, several function keys serve as shortcuts to adjust the brightness of the display and the keyboard illumination. F1 dims the display and F2 brightens the display. F9 dims the keyboard illumination and F10 brightens the keyboard illumination.

When the Ambient Light Sensor (ALS) is on, the function keys associate the current brightness setting to the current sensor reading.

If you use Mac OS X 10.3, the default settings for Exposé also use the F8, F9 and F10 keys. If your computer has an Ambient Light Sensor and is also running Mac OS X 10.3, hold down the "fn" key with the function key in order to activate the Exposé functions.
You can also remap the keys for the Exposé features by using the Exposé pane of System Preferences.

Since the system is automatic, as the ambient light changes, the display and keyboard illumination levels vary from the base level you established. As ambient light levels grow brighter or dimmer, the keyboard and display change from the level you selected to compensate for the brighter or dimmer setting. They return to the originally selected brightness when the ambient light level is the same as when you originally set the controls.

When the ALS is not turned on for displays, the brightness control keys (F1 or F2) work as on previous PowerBook computers, setting a fixed brightness of the display backlight.

Unlike the display brightness keys, the keyboard brightness can only be adjusted when the ALS is engaged with the keyboard illuminated (as in a dimly lit room). If you press the keyboard illumination control keys (F8, F9 or F10) at any other time, you will see a dimmed graphic with the prohibitory sign (see Figure 1) to remind you that the ambient light is not low enough for the keyboard illumination to have activated.

Alert that ALS cannot be configured

Notes:

1. Artificially activating the keyboard backlight by covering the sensors may not produce the desired results. The keyboard illumination is not normally visible in ambient lighting conditions brighter than a dimly lit room.
2. Not all PowerBook G4 (15-inch FW 800) models include the backlit keyboard and ambient light sensor. To determine if your model includes these features see if the F8, F9, and F10 keys have the ambient light sensor icons printed on them.

F8, F9 and F10 keys on keyboard

If these icons are not printed on the keys, then these features are not present in your model.

Published Date: Oct 10, 2016

About the PowerBook G4 (17-inch) and (15-inch FW 800) ambient light sensor (ALS)

Learn how the Ambient Light Sensor (ALS) feature of the PowerBook G4 (17-inch) or PowerBook G4 (15-inch FW 800) computer automatically controls the display and keyboard brightness.

This article has been archived and is no longer updated by Apple.

The ambient light-sensing (ALS) system automatically adjusts the brightness of your display and keyboard illumination according to the light available in your current environment.

Display and keyboard can be independently disconnected from ALS, so it will not automatically adjust their brightness. For more information, see "**PowerBook G4 (17-inch), (15-inch FW 800): How to Turn Off Ambient Light Sensor (ALS) Automatic Brightness Adjustment**".

Multiple sensors are used to approximate the ambient light. The brightness of both the display and keyboard backlights are adjusted, based on this approximation.

The display and keyboard brightness can be adjusted to match the ambient light level. This setting is not static like previous display backlight settings. The brightness level indicators will vary based on the measured ambient light. For more information, see "**PowerBook G4 (17-inch), (15-inch FW 800): About Adjusting Brightness on Ambient Light Sensor (ALS)**".

When the Ambient Light Sensor (ALS) feature is on and the display or keyboard backlight brightness is adjusted manually, the relative brightness over the entire ambient light response curve is similarly adjusted.

Note: Not all PowerBook G4 (15-inch FW 800) models include the backlit keyboard and ambient light sensor. To determine if your model includes these features see if the F8, F9, and F10 keys have the ambient light sensor icons printed on them.

F8, F9 and F10 keys on keyboard

If these icons are not printed on the keys, then these features are not present in your model.

PowerBook G4 (17-inch): How to Run Apple Hardware Test

This document explains how to use Apple Hardware Test on a PowerBook G4 (17-inch) computer.
This article has been archived and is no longer updated by Apple.
With PowerBook G4 (17-inch) computers, Apple Hardware Test (AHT) is included on the same DVD disc you use to install or restore software. This DVD is named "PowerBook G4 17 inch Software Install and Restore".

Running Apple Hardware Test

To use AHT on your PowerBook G4 (17-inch) computer, follow these steps:

1. Insert the disc named "PowerBook G4 17 inch Software Install and Restore" into the computer.
2. Choose Apple menu > Restart, and hold the Option key while the computer starts up. The startup manager appears (Figure 1).
3. Click the Apple Hardware Test volume in the startup manager.

Figure 1 Startup manager

4. Click the arrow that points to the right.
5. Follow the onscreen instructions.

PowerBook G4 (17-inch), MacBook Pro, and MacBook Pro (17-inch) displays open to approximately 130 degrees

This article has been archived and is no longer updated by Apple.

The displays of MacBook Pro, MacBook Pro (17-inch), PowerBook G4 (17-inch), PowerBook G4 (17-inch 1.33GHz) and PowerBook G4 (17-inch 1.5GHz) computers open to a maximum angle of approximately 130 degrees.

You can adjust the angle of the built-in display to minimize glare and reflections from overhead lights and windows. Do not force the display if you meet resistance. The displays on these computers are designed to open to a maximum angle of approximately 130 degrees. This is because these computers use a different hinge from other PowerBook G4 models.

PowerBook G4 (17-inch), (17-inch 1.33GHz): About the FireWire Ports

This document discusses the two FireWire ports on the PowerBook G4 (17-inch) and PowerBook G4 (17-inch 1.33GHz) computers.
This article has been archived and is no longer updated by Apple.
The PowerBook G4 (17-inch) and PowerBook G4 (17-inch 1.33GHz) computers include one FireWire 400 port and one FireWire 800 port. They are located on the right side of the computer. The connectors are not identical, and require different cabling. As well as each port having its own cable, an adapter cable can be used to allow the FireWire 800 port to connect to FireWire 400 devices.

Figure 1 Location of FireWire ports

1	FireWire 400
2	FireWire 800

Power considerations

The two ports share a single power supply that provides up to 7 W of power per port. They are on the same FireWire bus. You can connect to up to 62 FireWire devices to them simultaneously. If you connect a bus-powered FireWire device to the computer while it is operating from battery power, the battery will empty sooner. This decreases the amount of time the computer can run on battery power.

FireWire target disk mode

Both the FireWire 400 and FireWire 800 ports can be used with FireWire target disk mode. For more information on target disk mode, see technical document 58583, "**Macintosh: How to Use FireWire Target Disk Mode**".

Audio cables aren‘t completely recessed in aluminum models of PowerBook G4

This article has been archived and is no longer updated by Apple.

When you insert an audio cable (headphones, external speakers, connection to stereo system) into the audio line-in or headphone ports on aluminum PowerBook G4 computers, a small gap may be noticeable between the connector and the side of the computer's case. This gap is normal and assures electrical separation for optimum performance from these two sound ports.

You may see this in any of the aluminum models:

- PowerBook G4 (17-inch)
- PowerBook G4 (17-inch 1.33GHz)
- PowerBook G4 (17-inch 1.5GHz)
- PowerBook G4 (17-inch 1.67GHz)
- PowerBook G4 (15-inch FW800)
- PowerBook G4 (15-inch 1.5/1.33GHz)
- PowerBook G4 (15-inch 1.67/1.5GHz)
- PowerBook G4 (12-inch)
- PowerBook G4 (12-inch DVI)
- PowerBook G4 (12-inch 1.33GHz)
- PowerBook G4 (12-inch 1.5GHz)

PowerBook G4 (17-inch), (15-inch FW 800): Keyboard Illumination Turns Off When Idle

If you leave your PowerBook G4 (17-inch) or (15-inch FW 800) computer idle, the keyboard illumination will turn off after a certain period of time.
This article has been archived and is no longer updated by Apple.
If you select the option "Illuminate keyboard in low light conditions" in the Keyboard pane of System Preferences, the computer will turn on the keyboard's illumination in low light conditions.

If the computer is idle for a certain number of minutes, the keyboard's illumination turns off. You can set the amount of time before the illumination is turned off in the Keyboard pane of System Preferences. Drag the slider under "Turn off when keyboard is not used for:" to the amount of time you wish to use.

Note: Not all PowerBook G4 (15-inch FW 800) models include the backlit keyboard and ambient light sensor. To determine if your model includes these features see if the F8, F9, and F10 keys have the ambient light sensor icons printed on them.

Figure 1 F8, F9 and F10 keys on keyboard

If these icons are not printed on the keys, then these features are not present in your model.

PowerBook G4 (17-inch): About the PC Card Slot

This document discusses the PC Card slot in the PowerBook G4 (17-inch) computer, what types of cards it can use, and how to eject a PC Card.

This article has been archived and is no longer updated by Apple.

Compatibility

The PowerBook G4 (17-inch) computer comes with one PC Card slot that can accept one Type I or one Type II card. It does not accept Type III cards.

You can use cards that comply with the 16-bit PC Cards and 32-bit CardBus Cards standards. Cards can be removed and replaced while the computer is in use.

Important: The Apple AirPort Card and AirPort Extreme Card are not PC Cards or CardBus cards. Do not insert them into the PowerBook G4 (17-inch) computer's PC Card slot.

Ejecting

To eject a PC Card:

1. With the computer turned on, drag the card's icon to the Trash.
2. Push the PC Card eject button once to release it.
3. Push the eject button again to eject the card.
4. Pull the card out of the slot.

PowerBook G4 (17-inch), (17-inch 1.33GHz): Serial Number Location

This document explains where to find the serial number on PowerBook G4 (17-inch) and PowerBook G4 (17-inch 1.33GHz) computers.

This article has been archived and is no longer updated by Apple.

The configuration information, serial number, Ethernet ID, AirPort Extreme ID, and Bluetooth ID are all located on a label on the bottom of the computer's battery bay. To see the label, remove the battery from the computer. See Figure 1.

Figure 1 Serial Number Label in Battery Bay

The serial number can also be found by choosing Apple menu > About This Mac, and clicking the version number twice. For more information on viewing the serial number this way, see technical document 106486, "**Mac OS X 10.1: About This Mac Window Provides Computer Serial Number**".

For more information on removing the battery, see technical document 88059, "**PowerBook G4 to PowerBook G4 (17-inch): How to Remove or Install the Battery**".

Xserve (Slot Load): When to Use the Optical Drive Protector

This document explains when to use the optical drive protector included with the Xserve (Slot Load) server.
This article has been archived and is no longer updated by Apple.
The Xserve (Slot Load) server has a slot-loading optical drive. This drive requires extra attention when the server is installed in or removed from a rack.

When you first remove the server from its original packaging materials, you'll notice that the optical slot on the server's front panel has a protector installed. This protector prevents damage to the section of the front panel above the CD slot.

Important: Do not dispose of this protector. You may need to use it in the future.

In general, avoid applying pressure to this area of the server's enclosure.

Make sure the protector is in place under these or similar circumstances:

- When shipping the server in its shipping box.
- When installing the server in a rack (using the provided installation template).
- When removing the server from a rack.
- When installing additional servers above or below the server in a rack.
- When repairing the server.

Note: The protector must be removed in order to insert or remove a disc from the optical drive. If a disc is in the drive, eject it before installing the protector.

PowerBook G4 (17-inch), (17-inch 1.33GHz): Sound Specifications

This document discusses the sound specifications of the PowerBook G4 (17-inch) and PowerBook G4 (17-inch 1.33GHz) computers.
This article has been archived and is no longer updated by Apple.
The PowerBook G4 (17-inch) and PowerBook G4 (17-inch 1.33GHz) computers have an audio line-in port, headphone port, and an integrated microphone.

The audio line-in port is a stereo 3.5 mm mini-phono jack that allows the connection of a line-level microphone or other audio equipment.

The headphone port also uses a 3.5 mm mini-phono jack and provides enough current to drive a pair of low-impedance headphones. It can support external speakers (which may require external power) or other sound output devices.

The integrated microphone is located underneath the left speaker grill near the Tab key.

The computer includes two stereo speakers located beneath the speaker grills.

PowerBook, iBook: Trackpad Is Too Responsive or Does Not Move the Cursor

If you find the pointer on your PowerBook iBook computer moves as you type, or if you find that the cursor does not move when you use the trackpad, you may need to check the computer's palm rejection feature.

This article has been archived and is no longer updated by Apple.

Symptom

- The pointer moves as you type, or the cursor does not move when you use the trackpad.

Solution

The PowerBook and iBook computers, depending on the operating system they are running, may have an advanced palm rejection feature, which is designed to minimize accidental trackpad input while typing.

Turning on this feature on prevents the pointer from moving as you type. If you need to use the trackpad and the keyboard at the same time, turn this feature off.

Follow these steps if the pointer moves as you type:

1. Choose Apple menu > System Preferences.
2. Choose View > Keyboard&Mouse. (Some versions of the operating system may have this called Mouse.)
3. Select the Trackpad tab.
4. Select the option called either "Ignore trackpad while typing" or "Ignore accidental trackpad input".

Figure 1 Trackpad tab of Keyboard&Mouse preferences

When this option is selected, the pointer will not move if you accidentally brush the sides of the trackpad with your wrist as you type. To use the trackpad immediately after typing, touch the middle section of the trackpad.

If the cursor does not move while using the trackpad, verify that only one part of the finger is touching the trackpad or deselect this option.

For other troubleshooting steps for a nonresponsive trackpad, see technical document 17228, "**PowerBook: Jumpy or Erratic Trackpad**" and 58389, "**PowerBook and iBook: Trackpad Does Not Respond**".

PowerBook G4 (17-inch): Apple System Profiler Reports "Slot-B" PCI Device

Apple System Profiler may say that there is a "Slot-B" device in the Devices and Volume tab for the PowerBook G4 (17-inch) or PowerBook G4 (17-inch 1.33GHz) computer. This document explains what the "Slot-B" device is.

This article has been archived and is no longer updated by Apple.

On a PowerBook G4 (17-inch) or PowerBook G4 (17-inch 1.33GHz) computer, Apple System Profiler may report the name of the AirPort Extreme Card as "SLOT-B".

The AirPort Extreme Card in these computers is a card on the PCI bus based on the 802.11g draft specification. Notice that the Card Name field on the SLOT-B bus is "pci80211".

The AirPort Extreme Card is a 54 Mbit/s wireless Ethernet solution that comes standard with the PowerBook G4 (17-inch) computer.

Xserve (Cluster Node): Frequently Asked Questions (FAQ), Part 1 of 2

This document contains frequently asked questions (FAQ) regarding Xserve (Cluster Node), with answers to those questions.
This article has been archived and is no longer updated by Apple.
Questions answered in this document:

1. What is Xserve (Cluster Node)?
2. What market is the Xserve (Cluster Node) aimed at?
3. What does clustering enable me to do?
4. What are the differences between Xserve (Slot Load) and Xserve (Cluster Node)?
5. Can the Xserve (Cluster Node) be used as a server?
6. What is the hard drive capacity of the Xserve (Cluster Node)?
7. Are Xserve (Cluster Node) Apple Drive Modules compatible with those in the Xserve and Xserve (Slot Load)?
8. Can the Xserve (Cluster Node) serve as a host to the Xserve RAID?
9. What is the maximum memory capacity of the Xserve (Cluster Node)?
10. What ports are available on the Xserve (Cluster Node)?

Question 1: What is Xserve (Cluster Node)?

Answer: The Xserve (Cluster Node) is a 1U rack-mounted server tailored for use in computational clusters and distributed applications.

Question 2: What market is the Xserve (Cluster Node) aimed at?

Answer: The Xserve (Cluster Node) is aimed at creative, higher education, and life science communities.

Question 3: What does clustering enable me to do?

Answer: You can save a great amount of time by dividing one large problem into smaller parts, which can then be computed simultaneously on clusters. Examples of large problems include looking for a specific gene sequence or 3D rendering.

Question 4: What are the differences between Xserve (Slot Load) and Xserve (Cluster Node)?

Answer: The following table outlines the major differences between the Xserve (Cluster Node) and the Xserve (Slot Load):

Xserve (Cluster Node)	**Xserve (Slot Load)**
one hard drive bay	four hard drive bays
one gigabit Ethernet interface - on logic board only	two gigabit Ethernet interfaces - one on logic board, one on card installed in PCI/AGP slot
no graphics card	one ATI card, optional AGP 4x card
no optical drive	CD-ROM or Combo Drive
no connectivity to PCI/AGP slot	one half-length combination PCI/AGP slot
10-user license of Mac OS X Server	Unlimited-Client Edition of Mac OS X Server

See http://www.apple.com/xserve/specs.html for more information.

Question 5: Can the Xserve (Cluster Node) be used as a server?

Answer: Yes, the Xserve (Cluster Node) can be used as a server. However, this configuration was specially optimized for computing cluster tasks and the differences between Xserve (Slot Load) and Xserve (Cluster Node) should be kept in mind.

Question 6: What is the hard drive capacity of the Xserve (Cluster Node)?

Answer: There is one hard drive bay that comes with a 60 GB Apple Drive Module (ADM). The 180 GB ADM can also be used in this server and can be purchased as a separate kit from Apple.

Question 7: Are Xserve (Cluster Node) Apple Drive Modules compatible with those in the Xserve and Xserve (Slot Load)?

Answer: Yes.

Question 8: Can the Xserve (Cluster Node) serve as a host to the Xserve RAID?

Answer: Yes. Apple does not offer the Apple Fibre Channel PCI card as a configurable option for the Xserve (Cluster Node), but the Fibre Channel PCI card can be purchased as a separate kit from Apple.

Question 9: What is the maximum memory capacity of the Xserve (Cluster Node)?

Answer: 2 GB of 333 MHz Double Data Rate (DDR) memory.

Question 10: What ports are available on the Xserve (Cluster Node)?

Answer: The back panel of the Xserve (Cluster Node) has two FireWire 800 ports, two USB 1.1 ports, and one DB-9 (RS-232) port. The front panel has one FireWire 400 port.

Xserve (Cluster Node): Frequently Asked Questions (FAQ), Part 2 of 2

This document contains frequently asked questions (FAQ) regarding Xserve (Cluster Node), with answers to those questions.
This article has been archived and is no longer updated by Apple.
Questions answered in this document:

1. How many PCI slots are available on the Xserve (Cluster Node)?
2. What is the serial port intended for?
3. What are the configurable options for the Xserve (Cluster Node)?
4. Are there any graphics cards available for the Xserve (Cluster Node)?
5. Are there any optical drives available for the Xserve (Cluster Node)?
6. Which mounting racks can the Xserve (Cluster Node) be installed in?
7. Does the Xserve (Cluster Node) have redundant power supplies?
8. How do I install software or restore the OS without a CD-ROM?
9. What applications can run on the Xserve (Cluster Node)?
10.

Question 1: How many PCI slots are available on the Xserve (Cluster Node)?

Answer: There are two 64-bit, 66 MHz PCI slots available on the Xserve (Cluster Node). Note that the AGP/PCI combination slot is not available on this product.

Question 2: What is the serial port intended for?

Answer: The DB-9 (9-pin) serial port allows administrators to access the server through a serial console session using UNIX commands.

Question 3: What are the configurable options for the Xserve (Cluster Node)?

Answer: RAM is offered as a configurable option for the Xserve (Cluster Node). Although there are no other configurable options, two kits are available for purchase from Apple--the 180 GB Apple Drive Module (ADM) and the Apple Fibre Channel card.

Question 4: Are there any graphics cards available for the Xserve (Cluster Node)?

Answer: Apple does not offer a graphics card, but there are third-party options available.

Question 5: Are there any optical drives available for the Xserve (Cluster Node)?

Answer: Apple does not offer an optical drive, but there are third-party options available.

Question 6: Which mounting racks can the Xserve (Cluster Node) be installed in?

Answer: The Xserve (Cluster Node) fits in EIA-310-D-compliant, industry-standard 19-inch (483 mm) wide racks, including four-post racks (24 inches (607 mm), 26 inches (660 mm), and from 29 to 36 inches (734 mm to 914 mm) deep) and two-post Telco racks (center-mount brackets are included).

Question 7: Does the Xserve (Cluster Node) have redundant power supplies?

Answer: No.

Question 8: How do I install software or restore the operating system without a CD-ROM?

Answer: There are several ways to install or restore software, including the following:

- Start up from the provided CD using a FireWire optical drive.
- Use FireWire Target Disk Mode and perform the installation from the host computer.
- Insert the 60 GB ADM into another Xserve to perform the installation.
- Use Apple's NetBoot and Network Install technology built into Mac OS X Server 10.2 to perform the installation from another server.

Question 9: What applications can be used on the Xserve (Cluster Node)?

Answer: Any application that can be used with Mac OS X Server work with Xserve (Cluster Node). Be aware, however, that this configuration is designed to be accessed remotely through connections such as SSH, or by software applications that communicate directly to the server over the network (with no graphics card). If you are not sure whether your application can be used in a "headless" configuration (without a display), check with the software publisher.

Xserve, Xserve (Slot Load): Apple System Profiler Lists Fibre Channel PCI Card Twice

When an Xserve or Xserve (Slot Load) server has a Fibre Channel PCI card installed, you may see the Fibre Channel PCI card listed twice in Apple System Profiler. The card otherwise appears to function as expected.
This article has been archived and is no longer updated by Apple.

Symptom

When an Xserve or Xserve (Slot Load) server has a Fibre Channel PCI card installed, you may see the Fibre Channel PCI card listed twice in Apple System Profiler. The card otherwise appears to function as expected.

Solution

This symptom does not indicate a hardware issue. This is expected behavior for the Apple Fibre Channel PCI card, as the card is listed once per channel.

PowerBook G4 (17-inch), (15-inch FW 800): How the Ambient Light Sensor Works

This document describes how the ambient light sensor (ALS) feature of the PowerBook G4 (17-inch) or PowerBook G4 (15-inch FW 800) computer automatically controls the display and keyboard brightness.
This article has been archived and is no longer updated by Apple.
Two light sensors located under the speaker grills measure the amount of ambient light in your environment. Based on these measurements, the PowerBook G4 (17-inch) or PowerBook G4 (15-inch FW 800) computer can adjust the display's brightness and turn on the keyboard's illumination.

The display brightness and illuminated keyboard features can be turned on or off independently of each another. For more information on turning off the ALS, see technical document 86270, "**PowerBook G4 (17-inch), (15-inch FW 800): How to Turn Off Ambient Light Sensor (ALS)**".

Although both of these features are automatic, you can always remain in control. By pressing the function keys F1 and F2, you can adjust the display's brightness level. Once you find a level you like, the computer associates your selection with the current ambient light level. Using this selection, the computer automatically adjusts the display's brightness as light levels change. To change this selection, simply press F1 and F2 and associate another brightness level with another ambient light measurement. To turn this feature off, see technical document 86270: "**PowerBook G4 (17-inch), (15-inch FW 800): How to Turn Off Ambient Light Sensor (ALS)**".

The keyboard backlight works in a similar way. It turns on when the ambient light is low enough for the backlight to be useful. Once you are in an environment dark enough for the feature to turn on, press the F8, F9, and F10 keys to adjust the associated keyboard backlight level. As the ambient light level increases, the keyboard backlight increases until it reaches its maximum setting then turns off when there is enough room light. For more information, see technical document 86270: "**PowerBook G4 (17-inch), (15-inch FW 800): How to Turn Off Ambient Light Sensor (ALS)**".

Note: Not all PowerBook G4 (15-inch FW 800) models include the backlit keyboard and ambient light sensor. To determine if your model includes these features see if the F8, F9, and F10 keys have the ambient light sensor icons printed on them.

Figure 1 F8, F9 and F10 keys on keyboard

If these icons are not printed on the keys, then these features are not present in your model.

Published Date: Oct 10, 2016

PowerBook G4 (12-inch) feels warm to the touch

The left palm rest and bottom of a PowerBook G4 (12-inch) computers can become warm after extended periods of use.
This article has been archived and is no longer updated by Apple.
After extended periods of use, the surfaces of the PowerBook G4 (12-inch) computers can become warm. As with all Apple products, the PowerBook G4 (12-inch) computer was designed to comply with safety agency specifications. The internal fan in the PowerBook G4 (12-inch) computers was designed to turn on within a temperature range that is selected to ensure both proper operation of the computer, and that no surface temperature should present a safety issue.

Follow these suggestions to reduce the computer's operating temperature:

- When using your PowerBook G4 (12-inch) computer, place it on a hard surface such as a desktop or tray. A hard surface dissipates heat better than a soft surface. Do not place it on a soft surface such as a towel or pillow. This may block air flow under the computer and prevent enough heat from dissipating.
- To reduce the computer's operating temperature, change the Processor Performance setting:
    1. From the **Apple** menu, choose **System Preferences**.
    2. From the **View** menu, choose **Energy Saver**.
    3. Click Show Details, if necessary.
    4. Click the Options tab.
    5. Choose Reduced from the Processor Performance pop-up menu.
- To further reduce the computer's operating temperature, change settings to make the hard disk sleep when it is not being used:
    1. From the **Apple** menu, choose **System Preferences**.
    2. From the **View** menu, choose **Energy Saver**.
    3. Click Show Details, if necessary.
    4. Click the Sleep tab
    5. Select the "Put the hard disk to sleep when possible" option.

Note: The PowerBook G4 (12-inch) and PowerBook G4 (12-inch DVI) computer complies with the safety standard for Safety of Information Technology Equipment, IEC 60950. This safety standard has been adopted by many countries and is referred to as UL 60950 in the United States, CSA 60950-00 in Canada, EN60950 in Europe, and ASNZ3260 in Australia and New Zealand.

PowerBook G4 (17-inch), (15-inch FW 800): Illuminated Keyboard Does Not Respond When Pressing F8, F9 or F10

When you press F8, F9 or F10 on your PowerBook G4 (17-inch) or PowerBook G4 (15-inch FW 800) computer to change the keyboard illumination settings, you may see a prohibitory sign.
This article has been archived and is no longer updated by Apple.

Symptom

When you press F8, F9 or F10 on your PowerBook G4 (17-inch) or PowerBook G4 (15-inch FW 800) computer to change the keyboard illumination settings, you may see a prohibitory sign., as seen in Figure 1.

Figure 1 Prohibitory Sign Seen When Pressing F8, F9 or F10

Solution

If you see the dimmed graphic with the prohibitory sign when attempting to change the keyboard illumination settings, the sensed ambient light is not low enough for the keyboard illumination to be active.
Keyboard illumination cannot be adjusted until it is active. To adjust the keyboard illumination, take the computer into an environment that is dark enough to activate the feature. Then use the F8, F9 and F10 keys to make adjustments. For more information on this feature, see technical document 86270, "**PowerBook G4 (17-inch), (15-inch FW 800): How to Deactivate Ambient Light Sensor (ALS) Automatic Brightness Adjustment**".

Note: Not all PowerBook G4 (15-inch FW 800) models include the backlit keyboard and ambient light sensor. To determine if your model includes these features see if the F8, F9, and F10 keys have the ambient light sensor icons printed on them.

Figure 1 F8, F9 and F10 keys on keyboard

If these icons are not printed on the keys, then these features are not present in your model.

Xserve: How to find the serial number

Learn how to find the serial number of your Xserve computer.

This article has been archived and is no longer updated by Apple.

You can find your serial number in several places:

- In Mac OS X
- On the surface of the computer
- On the original product packaging
- On the original receipt (or invoice)
- Online at My Support Profile (available in the U.S. and Canada)

In Mac OS X

On most computers with Mac OS X, you can find the serial number in the About This Mac window.

On the surface of the computer

You can find the serial number for an Xserve computer within the model's configuration label, which is located on the computer's back panel in a pull out tab (shown below).

On the original product packaging

If you have the product's original packaging, there's a label on the original packaging box that lists the serial number, MAC addresses, and other info.

On the original receipt (or invoice)

Some retailers may include the serial number of your Xserve computer on the receipt.

Online at My Support Profile

If you used your Apple ID to register or purchase your Xserve computer, you may find the serial number listed in My Support Profile (available in the U.S. and Canada). Log in with your Apple ID and find your product in the "My Products" box on the main page:

Note: You may have more than one Apple ID and not realize it. For more information, visit My Apple ID and click "Find out."

Xserve and Xserve (Slot Load): Starting Up From a Mac OS X Server CD Takes Several Minutes

It may take four to eight minutes or more for an Xserve or Xserve (Slot Load) to complete the startup process when starting up from a Mac OS X Server CDs, which is included or purchased separately.
This article has been archived and is no longer updated by Apple.

Symptom

An Xserve or Xserve (Slot Load) server requires four to eight minutes, or longer, to start up from a Mac OS X Server CD. The startup time may increase when large amounts of memory (RAM) or PCI cards are installed, or when other devices are connected to the server.

Solution

This is expected behavior; it does not indicate an issue with the server or the CD.

Additional information

The startup process that is used when starting up from a Mac OS X Server Installer CD is different from the the process used when starting up from a Mac OS X Installer CDs. The Server Installer CD performs additional operations that are required to support the advanced features offered by the server configuration; one of these operations is copying the system from the CD to a RAM disk to allow for remote installation.

Power Mac G4 (Mirrored Drive Doors), Power Mac G4 (FW 800): Power Button May Require Firm Push

Some Power Mac G4 (Mirrored Drive Doors) and Power Mac G4 (FW 800) computers' power buttons may require a firm push.
This article has been archived and is no longer updated by Apple.

Symptom

Some Power Mac G4 (Mirrored Drive Doors) and Power Mac G4 (FW 800) computers' power buttons may require a firm push.

Solution

As a workaround, press the power button in its upper left quadrant to turn on the computer. The activator is directly behind this area.

Figure 1 Where to press power button

Macintosh: FireWire Hard Disk Does Not Appear in Finder If Connected to Computer Before AC Power

A FireWire hard drive that is not bus-powered may not appear on the desktop or in the Finder if it is connected to the computer before it is connected to an AC power source.

This article has been archived and is no longer updated by Apple.

Symptom

A FireWire drive that is not bus-powered does become available or appear on the desktop ("mount").

Solution

Connect the drive to an AC power source before connecting it to the computer.

If the issue has already occurred, unplug both the FireWire cable and the AC power, then plug in AC power before reconnecting the FireWire drive.

Additional information

In affected hard drives, the controller logic in the drive activates when the drive is plugged into the computer. The controller logic looks for, but does not find, the drive mechanism as soon as the drive is connected to the computer. The drive mechanism only runs from AC power, so until the drive is connected to an AC power source, the drive mechanism will be inactive. The controller continues to fail to find the drive mechanism even after the drive has been connected to an AC power source.

PowerBook G4 (17-inch), (17-inch 1.33GHz): Using the Security Cable Lock Slot

This document discusses the correct security system size to use when securing the PowerBook G4 (17-inch) or PowerBook G4 (17-inch 1.33GHz) computer.
This article has been archived and is no longer updated by Apple.
The PowerBook G4 (17-inch) or PowerBook G4 (17-inch 1.33GHz) computer includes a security cable lock slot on the left side of the computer.

Figure 1 Security cable lock slot

To use a third-party security system, choose one that does not apply pressure to the AC adapter when both are connected to the computer. This pressure can cause stress to the computer's AC power port.

Xserve, Xserve (Slot Load): SFP Cable Connectors Can Seem Difficult to Disconnect

This document explains how to remove the SFP cables from the Fibre Channel socket of the Xserve or Xserve (Slot Load).
This article has been archived and is no longer updated by Apple.

Symptom

The SFP cable connectors are difficult to disconnect.

This happens when the Apple Fibre Channel PCI card is installed in the server's upper dual PCI slot, which is the slot that is qualified for the Apple Fibre Channel PCI card.

Solution

If the release tab is too close to the chassis to be released by hand, insert a small flat tool (such as a flat-head screwdriver) and use it to depress the tab, then remove the cable.

Additional information

The release tab on the SFP cable connector is located very close to the chassis when the Apple Fibre Channel PCI card is installed in the upper PCI slot of the dual PCI riser card. The limited space can make it difficult to press the tab on the connector to release the cable.

Mac OS X 10.2.6: Unable to Log In After Installing Security Update 2003-06-09

After installing Security Update 2003-06-09 (version 1.0), you may be unable to log in by clicking the Log In button
This article has been archived and is no longer updated by Apple.

Symptom

When you try to log in, the window shakes and the password field becomes blank after clicking the Log In button. This occurs when the login window displays accounts in list view (the default setting).

Solution

Install Security Update 2003-06-09 (version 2.0).

As a workaround, type your account password and press Return instead of clicking the Log In button.

Xserve RAID: Only Fibre Channel Link Light Is On After Resetting Controller

If you hold the reset button too long during the reset procedure, the controller may stop responding.
This article has been archived and is no longer updated by Apple.

Symptom

Only the Fibre Channel link light is on (both on the front and on the back of the Xserve RAID). In RAID Admin, the controller is amber, the corresponding blower is off, and the corresponding Ethernet link is down.

This occurs when the controller has just been reset and the reset button was pressed too long.

Solution

1. Use RAID Admin to turn off the Xserve RAID.
2. If cache backup batteries are installed, pull them slightly out of the RAID.
3. Disconnect the power cables from both power supplies.
4. After 10 to 20 seconds, reconnect the power cables and start the Xserve RAID.
5. All LEDs on both controllers should turn back on. Wait for RAID Admin to update status until you see all modules are working again. This process can be expedited by quitting and reopening the RAID Admin application.
6. Reinstall the cache backup batteries.

PowerBook G4 (17-inch): External Speaker Noise During Sleep

When a PowerBook G4 (17-inch) computer is in sleep, external amplified speakers connected to the computer may make a static noise.
This article has been archived and is no longer updated by Apple.

Symptom

External amplified speakers connected to the computer make a static noise when it is in sleep.

Solution

Use one of these workarounds:

- Turn down the volume on the external speakers.
- Disconnect the external speakers.
- Unplug the external speakers' AC power source.

Published Date: Oct 10, 2016

Xserve RAID: "RAID Controller Not Ready" Message in RAID Admin

This document discusses possible causes of the message "RAID Controller not ready" in RAID Admin.
This article has been archived and is no longer updated by Apple.

Symptom

RAID Admin reports "RAID Controller not ready".

If you troubleshoot by swapping each controller module into the other module's slot, the symptom follows the controller module, not the slot.

Solution

Follow these steps to fix or isolate the issue. Check in between steps to see if the issue was resolved, or if you need to continue to the next step. Be sure to give RAID Admin enough time to update status before moving to the next step.

1. Quit the RAID Admin application and open it again. If the message does not reappear, it was caused by a refresh issue that did not update the message field.
2. Remove the Xserve RAID from the monitoring list and add it again. You may find that the Xserve RAID has acquired a new DHCP address (if set to DHCP) that would account for the connection failure. Rediscover the Xserve RAID and add it back to the monitoring list. If the Xserve RAID has the same IP address, removing and adding it back to the monitoring list may still be a helpful step to perform.
3. Look in the Component tab for the Xserve RAID having a component issue. If one of the controller modules has a warning, go to the System menu and restart that controller's coprocessor. This step does not take your data offline.
4. Quit the RAID Admin application. Pull both cache backup batteries slightly out from the Xserve RAID. Shut the RAID down, if possible, by holding the power button for five seconds.

   Warning: This step causes the RAID to go offline. Be sure any other computers are disconnected from RAID volumes when you perform this step.
   If the power button does not shut the RAID down, you will need to disconnect both power cables. After ten seconds, use the power button to turn on the RAID. After the RAID is on and the status LEDs on the front are solid green, the cache backup batteries may be reinstalled. Open the RAID Admin application and test the issue again.

If none of the steps listed above resolves the issue, contact Apple for further assistance.

Additional information

The "RAID Controller not ready" message is a general communications alert, which can indicate different causes.

The most common cause is that the RAID controller is restarting. This message is normal to see temporarily if the controller is restarting. The message only indicates an issue if the message is persistent.

This message does not in any way affect the data on the hard disks. In most cases the data on the hard disks is still accessible; only in very rare cases will the data be offline.

iBook (Dual USB) and Later: Resolving a "Clicking Speaker" Issue After Installing Mac OS X 10.2.5 or 10.2.6

Mac OS X 10.2.8 addresses an issue if your iBook (Dual USB) or later computer makes an audible clicking sounds from the speakers or headphones with Mac OS X 10.2.5 or 10.2.6.
This article has been archived and is no longer updated by Apple.

Symptom

In some cases, the speakers or headphones (if headphones are plugged in) may make audible clicking sounds. This could happen after updating to Mac OS X 10.2.5 or 10.2.6.

Solution

Download and install Mac OS X 10.2.8 to address this issue. See technical document 106704, "**Mac OS X: How to Update Your Software**," for more information.

eMac (ATI Graphics): External Ports and Connectors

This document discusses the external ports and connectors on the eMac (ATI Graphics) computer.

This article has been archived and is no longer updated by Apple.

Figure 1 External ports and connectors on the eMac (ATI Graphics) computer

Note: All ports and connectors discussed in this document are located on the I/O panel on the right side of the computer.

Headphone

Mini-headphone jack (headphones not included.)

The headphone jack provides enough current to drive a pair of low-impedance headphones. Headphones should have an impedance not lower than the recommended minimum impedance of 32 Ω. Headphones with lower impedance can be used, but with some degradation in performance.

Audio Input Jack

Analog audio input minijack; up to 16-bit stereo and 44.1 kHz sampling rate.

The external sound input jack is a 3.5 mm mini phone jack. The sound input jack accepts line-level stereo signals. It also accepts a stereo miniplug-to-RCA cable adapter for connecting stereo equipment to the computer.

USB

Total of five USB 1.1 compliant ports: three on the computer (shared on two 12 Mbit/s (megabits per second) controllers); two on the keyboard, which contains a USB hub.

The USB ports use USB Type A connectors, which have four pins each.

The USB ports support both low-speed and high-speed data transfers, at up to 1.5 Mbit/s and 12 Mbit/s, respectively. High-speed operation requires the use of shielded cables.

FireWire

Two 400 Mbit/s FireWire (IEEE 1394) ports (actual rates will vary); 8 W shared.

When the computer is on, the power pin provides a maximum voltage of 24 V (no load) and up to 8 W total power (shared by both connectors). Zero voltage is present at the power pin when the computer is in Sleep mode or when it is off.

The eMac computer supports Target Disk Mode (TDM).

Modem

Built-in 56 kbit/s V.92 modem. Actual modem speeds lower; speed depends on connection rate and other factors.

The telephone connector for the modem is an RJ-11 connector on the I/O panel.

The modem has the following features:

- Modem bit rates up to 56 kbit/s (supports V.92, V.90, and K56flex modem standards)
- Group 3 fax modem bit rates up to 14.4 kbit/s

The modem appears to the system as a serial port that responds to the typical AT commands. The modem provides an analog sound output for monitoring the progress of the modem connection.

10/100 BASE-T Ethernet

The eMac has a built-in 10/100 Mbit/s Ethernet port. The eMac computer can be connected to an Ethernet cable from a hub, switch, or router, or to another Macintosh computer using a crossover or patch cable. The connected device can be either a 10BASE-T or a 100BASE-TX device; the port automatically detects which type of device is connected.

Video Out Port

Mini-VGA output port (requires VGA display adapter). The mini-VGA output port supports only video mirroring. The external devices displays an image identical to that shown on the built-in display.

The external monitor supports only the display resolutions that are available on the internal monitor.

An adapter is available to convert the eMac's mini-VGA output port to S-video and composite video.

Power Button

This button is used to turn the computer on, turn the computer off, or reset the computer.

Apple Cinema HD Display: How to Remove Adhesive Residue

The Apple Cinema HD Display is packaged with a protective film wrapped around the lower area of the front bezel. In the unlikely event that some of the adhesive residue remains after the protective film is removed, follow the steps in this document to remove the adhesive.
This article has been archived and is no longer updated by Apple.
The Apple Cinema HD Display is packaged with a protective film wrapped around the lower area of the front bezel. In rare cases the protective film may be difficult to remove in one piece, and may leave behind an adhesive residue that is hard to remove using the normal cleaning recommendations for Apple products. For normal cleaning methods, see technical document 30889, "**Translucent Plastics: How to Clean**".

Follow these steps to remove the residue:

1. Make sure the material you are trying to clean is the residue left behind from the protective film and not something else. Fingerprints, sticky residue from candy, and many other common materials can be easily cleaned using a damp, lint-free cloth.
2. For cleaning the adhesive left behind from the protective film, use "Goo Gone", produced by Magic American Corporation based in Cleveland, Ohio. (http://www.magicamerican.com/products_gg.aspx).
3. Apply a small amount of Goo Gone to a clean lint-free cloth. If too much cleaning solution is used, it may migrate into any gaps in the case plastics.
4. Gently rub the lint-free cloth over the areas that have the adhesive residue until all of the adhesive has been removed.
5. Gently polish the affected areas with a clean, lint-free cloth to remove any remaining cleaning solution residue.

Important: Information about products not manufactured by Apple is provided for information purposes only. Please contact the vendor for additional information.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

Mac OS X: Apple Fibre Channel and SCSI PCI Card Can Prevent Deep Sleep

If the Apple Fibre Channel PCI card or other Apple SCSI PCI cards are installed in a computer, the computer cannot enter deep sleep mode.
This article has been archived and is no longer updated by Apple.

Symptom

When the Apple Fibre Channel PCI card or another SCSI PCI card is installed in a Power Mac G5, Power Mac G4, or Xserve, the system does not sleep. Therefore, your system will not go into low-power mode during long periods of inactivity. Because the Power Mac G5, Power Mac G4 or Xserve is unable to sleep, the fans may appear to run excessively.

Solution

This is expected behavior. The fact that the system does not sleep causes no harm to the system or its components.

1. Open System Preferences.
2. Select Energy Saver.
3. Move the computer sleep slider to "Never", so that the computer does not attempt to sleep.

Related Documents

86407 About "Sleep" and "Deep Sleep"

Published Date: Oct 10, 2016

About "Sleep" and "Deep Sleep"

"Sleep" and "deep sleep" are used to refer to low-power modes of the computer.

This article has been archived and is no longer updated by Apple.

When you select the Sleep command in Mac OS (or when the computer goes to sleep as a result of Energy Saver settings), as many components as possible will enter a low-power mode.

If all hardware components and connected peripherals are in a low-power mode, your computer is in "deep sleep". However, not all hardware components and peripherals are capable of running in a low-power mode.

If one or more hardware components or peripherals does not enter a low-power mode, your computer may simply sleep.

Power Mac G5: External Antenna Required for AirPort or Bluetooth Reception

To use Bluetooth and AirPort on a Power Mac G5, you must connect the external antennas.
This article has been archived and is no longer updated by Apple.

Symptom

A Power Mac G5 computer does not detect an AirPort network or Bluetooth device, even though the base station or device is well within range.

Solution

Make sure you have the appropriate external Bluetooth and/or AirPort antennas properly connected at the rear of the computer. The AirPort antenna is included with the Power Mac G5 and is compatible with the AirPort Extreme card. The Bluetooth antenna is only included if you purchased Bluetooth as a CTO option from Apple.
Third-party devices may include their own antennas.

Antenna description:

- The Bluetooth antenna is a short cylindrical antenna.
- The AirPort antenna is larger and resembles a capital "T".

Warning: The FCC rules require that the operator or a nearby person be more than one centimeter (0.4 inches) away from the AirPort Extreme antenna during transmission. In addition, the AirPort Extreme antenna must not be co-located with any transmitter or antenna other than Apple Bluetooth antenna model A1067.

Power Mac G5: How to Identify External AirPort and Bluetooth Antennas

This article has been archived and is no longer updated by Apple.

Most Power Mac G5 computers include at least one external antenna, for AirPort. You also receive an antenna for Bluetooth if you ordered that configuration. You can identify antennas using the pictures presented here.

Power Mac G5 (Late 2005) models have their AirPort and Bluetooth antennas integrated into the enclosure, and do not use the external antennas described in this article.

AirPort antenna

The AirPort antenna, shown below, is shaped like a capital "T" . Once connected, it can be rotated to provide the best signal to the computer.

Bluetooth antenna

The Bluetooth antenna, shown below, is a small cylindrical antenna that provides reception for Bluetooth devices.

Warning:The FCC rules require that the operator or a nearby person be more than one centimeter (0.4 inches) away from the AirPort Extreme antenna during transmission. In addition, the AirPort Extreme antenna must not be co-located with any transmitter or antenna other than Apple Bluetooth antenna model A1067.

Power Mac G5: Optical Audio Port Specifications

This document contains specifications for the optical digital audio ports introduced in the Power Mac G5 computer.
This article has been archived and is no longer updated by Apple.
Power Mac G5 computers have two optical audio ports of a type new to Macintosh. They allow you to connect a variety of audio equipment using digital optical (a.k.a. "Toslink") cables. Cables with Toslink connectors are the style compatible with the Power Mac G5 computer. These optical audio ports allow the transfer of stereo audio or encoded 5.1 audio (commonly found on DVD movies).

Figure 1 Optical Audio Ports

The specifications for these ports are:

Data format: Sony/Phillips Digital Interface (S/PDIF) protocol (IEC60958-3)
Connector type: Toslink optical (IEC60874-17)
Bits per sample: 16-bit or 24-bit

Optical digital audio out

Note: Specifications are based on a typical situation with playback of a 1KHz, -1dBFS 24-bit sine wave, 44.1Khz output sample rate, unless otherwise specified below.

Output sample rate: 32 kHz, 44.1 kHz or 48 kHz
Signal-to-noise ratio: Greater than130 dB
Total harmonic distortion + noise: Less than -130 dB (0.00001 percent)

Optical digital audio in

Note: Specifications are based on a typical situation with playback of a1KHz, -1dBFS 24-bit sine wave, unless otherwise specified below.

Fsi-input sample rate (external clock mode): 32 kHz, 44.1 kHz or 48 kHz
Fsi-input sample rate (internal clock mode): 16 kHz to 96 kHz
Signal-to-noise ratio (external clock mode): Greater than130 dB
Signal-to-noise ratio (internal clock mode, 16 kHz < Fsi < 96 kHz): Less than -112 dB
Total harmonic distortion + noise (external clock mode): Less than -130 dB (0.00001%)
Total harmonic distortion + noise (internal clock mode, 16 kHz < Fsi < 96 kHz): Less than -112 dB (0.0003%)

Power Mac G5: ATA Parallel-to-Serial Adapters Not Supported

Parallel-to-Serial ATA adapters made by third-party vendors do not work with Power Mac G5 computers.
This article has been archived and is no longer updated by Apple.

Symptom

A Parallel ATA hard drive attached to a Power Mac G5 computer via an adapter does not work.

Solution

Power Mac G5 computers have only Serial ATA busses. There are third-party adapters to connect Parallel ATA hard drives to Serial ATA busses, but these adapters are not supported for use on the Power Mac G5 computer. If you wish to upgrade your hard drive or add a second hard drive, you should use only native Serial ATA hard drives.

A native Serial ATA hard drive has the Serial ATA data and power connector on the hard drive and does not require the use of adapters or special cables.

Power Mac G5 audio output options

Learn about the two audio output options when playing a DVD movie on a Power Mac G5 computer, and how to select them.
This article has been archived and is no longer updated by Apple.
Depending on the equipment you have, you can select one of two types of audio output when playing a DVD movie:

System Sound Output, the default format, outputs analog audio that plays on your computer's built-in speakers, stereo headphones, or other audio device.

Digital Out outputs digital audio and doesn't use the built-in speakers at all. It works with devices that support the S/PDIF format. Digital Out allows you to use a home theater system to play back 5.1 audio. If you use Digital Out, the volume slider is always at maximum and grayed out, because the volume is controlled by the receiver or speakers rather than by the computer.

To use Digital Out, your audio equipment must support S/PDIF. You might need to install drivers required by your audio device. Contact the manufacturer of your audio device to determine whether you need to install drivers.

To choose the type of audio output you want to use within DVD Player:

1. If you want to use digital audio, first connect your audio device to your computer.
2. Choose Preferences from the DVD Player menu and click Disc.
3. Choose the type of audio output you want from the Sound Type pop-up menu.

To choose the type of audio output you want to use from System Preferences:

1. If you want to use digital audio, first connect your audio device to your computer.
2. Open System Preferences and select Sound.
3. Click Output and select your preferred output method.

If you choose Digital Out Output, DVD Player uses the digital output device you choose regardless of the settings in the Sound pane of System Preferences. In fact, the volume setting on the computer will be ignored as the digital sound out volume is controlled by the audio device.

If you choose System Sound Output, DVD Player uses the audio output selected in the Sound preferences pane.

Xserve: Initial IP Address of Vixel 335 Fibre Channel Switch From Apple Store

Some of the Vixel 335 Fibre Channel switches shipped from the Apple Store included incorrect information about the initial IP address the switch is configured with. This document provides the correct initial IP information for these switches.
This article has been archived and is no longer updated by Apple.
Vixel 335 Fibre Channel switches purchased from Apple have the following initial IP configuration:

IP Address: 169.254.10.10
Subnet Mask: 255.255.0.0
Gateway Address: 0.0.0.0

To connect to the switch and make changes, you need to configure the administration computer to be on the same subnet as the switch's initial IP settings.

Xserve (Slot Load), PowerBook G4 (12-inch): Cannot Eject Audio CD

Some Xserve (Slot Load) servers and PowerBook G4 (12-inch) computers may not eject audio CDs from their combo drives.
This article has been archived and is no longer updated by Apple.

Symptom

Neither pressing the eject key nor holding the mouse button during startup will cause your audio CD to eject.

Note: This happens with audio CDs that are in undamaged, working condition.

Solution

Use the firmware update that has been released to fix this issue. You can download and install the updater from Software Dowload document 120212, "**Slot Combo Drive Update: Information and Download**", or you can use the Software Update feature of System Preferences.

Note: If you have a slot-load optical drive that still has an audio CD in it and you are unable to eject the disc, you will not be able to run the firmware update. It is essential that the audio CD be removed before the firmware updater is run. If you cannot remove the disc, please contact a service provider for assistance.

Xserve RAID: Fibre Channel Utility Reports No Fibre Channel Card Available

The Apple Fibre Channel Utility may report that no Apple Fibre Channel card is available.
This article has been archived and is no longer updated by Apple.

Symptom

The Fibre Channel Utility reports that there is no Fibre Channel card installed.

This happens after you install the the "FibreChannelDriverUpdate.pkg" on the computer with the card, and the computer is restarted.

Solution

Follow these steps:

1. Open the Terminal utility.
2. Type the following at the prompt: sudo touch /System/Library/Extensions/
3. Press return.
4. Type your administrator password.
5. Press return.
6. Restart the computer.

Macintosh: USB 2.0 Specifications and Information

Specifications of the USB 2.0 ports included with some Macintosh computers.

This article has been archived and is no longer updated by Apple.

USB ports on the computer

Certain Macintosh models have up to three built-in USB Type A ports that comply with USB 2.0 specifications. Each built-in USB port can provide a data transfer rate of 480 megabits per second (Mbit/s).

You can connect either USB 1.1 or USB 2.0-compliant devices to the computer's USB 2.0 ports.

As with USB 1.1, you can connect up to 127 devices on each USB controller. You can use Apple System Profiler to identify which devices share the same USB controller.

The data transfer rates each port uses depends on whether the communication occurs at low-speed, mid-speed or high-speed. These rates are:

- Low-speed: 1.5 Mbit/s
- Full-speed: 12 Mbit/s
- High-speed: 480 Mbit/s

USB ports on the keyboard and display

The USB ports on your Apple Pro Keyboard or Apple Pro Keyboard (2003) are USB 1.1 compliant ports, allowing a 1.5 Mbit/s or 12 Mbit/s data transfer rate. Apple displays that have USB hubs (any monitor that uses an ADC connector) are also USB 1.1 compliant.

A USB 2.0-compliant device connected to the ports on the keyboard or a display do not operate at high speed. The device may operate at full speed (12 Mbit/s) if it has that capability.

What to do if your Apple Keyboard becomes unresponsive

This article has been archived and is no longer updated by Apple.

If you have an original Power Mac G5 and are using the Apple Pro Keyboard (2003) that came with it, you may experience an occasional issue where your keyboard may not respond to your input. You might find that you can't enter text, or that a device connected to the keyboard's USB port, such as a mouse, doesn't work.

If this happens to you, unplug the keyboard from the computer and then plug it in again. This should make it work as expected. To prevent this from happening again, make sure that you have the keyboard connected directly to the computer—not through a USB hub or display. Also make sure that you've updated the computer's system software to Mac OS X 10.2.8 or later.

Macintosh: File System Specifications and Terms

This document explains: the limitations of the Mac OS Standard format (HFS), the practical limits after which performance suffers, and the Mac OS Extended format (HFS Plus).
This article has been archived and is no longer updated by Apple.
This document explains some of the terminology involved when speaking about volumes and the file system. It also explains why different formats on different hard drives can cause small files to take up more space on a larger drive than they do on a smaller drive. For more information on Mac OS Extended Format, and Volume and file limits in Mac OS 9, please see the following technical documents:

Document 30344: "**Mac OS: About Mac OS Extended Format**"
Document 24601: "**Mac OS Extended Format: Volume and File Limits**"

Mac OS Standard Format Specifications
Before discussing hard drive block allocation, and the intricacies of determining allocation block sizes and such, let's first review the Macintosh Standard format, sometimes called HFS.

Below are some specifications and associated terminology used to describe the Macintosh Standard format structure.

Volume
A volume is either a full disk, or a section of a disk, partitioned into separate parts. If you partition a single drive then each partition is considered a volume.

- The maximum volume size under System 6 and System 7 is 2 GB. System 7.5 increased that limit to 4 GB and System 7.5.2 (and later) increases that limit to 2 TB on some computers, including:

  - any computer that came with System 7.5.2 or newer.
  - any Macintosh computer with PCI slots.

- The maximum number of volumes is theoretically limited to 173 due to the maximum number of open files in the Mac OS. Since there are other files that are opened when the computer boots up, the actual maximum will vary depending upon how many other files are open by the operating system.
- The maximum file size is 2 GB.
- The maximum number of files on a volume is 65,536.
- The maximum number of files in a folder is 32,767.
- The maximum size of the data fork in a file is 2 GB.
- The maximum size of the resource fork in a file is 16 megabytes.

Note that AppleShare, including Personal File Sharing, has its own volume size limitations. For more information, please see technical document 15460: "**AppleShare File Server: Chart Of All Limitations**"

Logical block
A logical block is a unit of drive space composed of up to 512 bytes. A logical block is numbered from 0 to n, n being the last block on the volume - not necessarily the hard disk. Take the volume size, divide it by 512 bytes, and you have the number of logical blocks.

Allocation block
An allocation block is a unit of storage on a volume, composed of one or more logical blocks. The larger the volume, the more logical blocks comprise one allocation block. The maximum number of allocation blocks per volume is 65,536; most volumes have slightly less.

In both the Macintosh and DOS environments, the maximum number of blocks on a driver is 65,536 because both operating systems address the allocation blocks with a 16-bit address. Drives larger than 512 MB cannot use a block size of 8K or less because there just aren't enough addresses. Thus, if a 2 GB drive is one Macintosh partition, the smallest file size allowed is 32K. (If you save a SimpleText file with one character in it, it would take up 32K of disk space.) This means that the size of your hard drive determines the minimum size of each file.

A non-empty file fork always occupies at least one allocation block, no matter how many bytes of data the file fork contains. If the data fork and resource fork of a file contain data, the file uses two allocation blocks. If all the files are only one allocation block long, then there can be as many files on the volume as there are allocation blocks for the volume. However, when a file is longer than one allocation block, the total number of possible files decreases. For example, on a volume with 65,535 allocations block, you can have:

- 65,536 files, each 1 allocation block long.
- 32,768 files, each 2 allocation blocks long.
- 2048 files, each 32 allocation blocks long.
- 1024 files, each 64 allocation blocks long.

All of the numbers above refer to the System's record structures. Other elements place tighter restrictions on the actual number of usable files in the root directory. The Standard File dialog uses the List Manager. The List Manager has a limit of 32K of data, which is somewhere between 800 and 900 files. Though more files can be handled in a directory, the List Manager will only display the first 32K.

A second element concerns the performance of the Finder when approaching 800 to 900 files per directory. Even simple operations, such as moving the icon of a file, tend to slow down considerably when this number of files exists in a directory. This limitation changes depending on the speed of the individual Macintosh model.

Determining Allocation Block Size
Follow these steps to calculate the allocation block size:

1. Take the size of the drive in megabytes and multiply it by 2000 (there are 2000 disk blocks in 1 MB of disk space).
2. Divide that number by 65,536, since the Macintosh cannot have more than 65,536 allocation blocks.
3. Round this number up and multiply it by 512.

The result is the number of bytes in the allocation block. Here is an example using a 230 MB drive:

- 230 x 2000 / 65536 = 7.019
- 7.019 rounded up = 8
- 8 x 512 = 4096 bytes

So what does this mean to you? The larger the hard drive, the larger the allocation block size, and the more space that is wasted on small files. If you have a large drive with a lot of small files, the hard drive space is being used less efficiently than if most of your files average 32K in size.

Note: Since drives come from different manufacturers, it is possible to get different values. This is because a 500 MB drive is not exactly 500 MB but is usually somewhat larger. This could result in different logical block sizes than those listed in the chart (see Allocation Block Size Table below), but the difference should not be more than +/- 512 bytes. This difference is most noticeable on the larger drives. For example, the 500 MB drive actually calculates to 8192 bytes but the 500 MB drive in some Macintosh computers is actually 540 MB, which has a logical block size of 8704, as listed in the chart.

Allocation Block Size Table
Here is a complete list of allocation block sizes for the various volume sizes, based on the formula described above:

Volume Size	Allocation Block Size	Minimum file size
0-32 MB	1 logical block	0.5K
33-64 MB	2 logical blocks	1.0K
65-96 MB	3 logical blocks	1.5K
97-128 MB	4 logical blocks	2.0K
129-160 MB	5 logical blocks	2.5K
161-192 MB	6 logical blocks	3.0K
193-224 MB	7 logical blocks	3.5K
225-256 MB	8 logical blocks	4.0K
257-288 MB	9 logical blocks	4.5K
289-320 MB	10 logical blocks	5.0K
321-352 MB	11 logical blocks	5.5K
353-384 MB	12 logical blocks	6.0K
385-416 MB	13 logical blocks	6.5K
417-448 MB	14 logical blocks	7.0K
449-480 MB	15 logical blocks	7.5K
481-512 MB	16 logical blocks	8.0K
513-544 MB	17 logical blocks	8.5K
545-576 MB	18 logical blocks	9.0K
577-608 MB	19 logical blocks	9.5K
609-640 MB	20 logical blocks	10.0K
641-672 MB	21 logical blocks	10.5K
673-704 MB	22 logical blocks	11.0K
705-736 MB	23 logical blocks	11.5K
737-768 MB	24 logical blocks	12.0K
769-800 MB	25 logical blocks	12.5K
801-832 MB	26 logical blocks	13.0K
833-864 MB	27 logical blocks	13.5K
865-896 MB	28 logical blocks	14.0K
897-928 MB	29 logical blocks	14.5K
929-960 MB	30 logical blocks	15.0K
961-992 MB	31 logical blocks	15.5K
993-1024 MB	32 logical blocks	16.0K

1025-1056 MB	33 logical blocks	16.5K
1057-1088 MB	34 logical blocks	17.0K
1089-1120 MB	35 logical blocks	17.5K
1121-1152 MB	36 logical blocks	18.0K
1153-1184 MB	37 logical blocks	18.5K
1185-1216 MB	38 logical blocks	19.0K
1217-1248 MB	39 logical blocks	19.5K
1249-1280 MB	40 logical blocks	20.0K
1281-1312 MB	41 logical blocks	20.5K
1313-1344 MB	42 logical blocks	21.0K
1345-1376 MB	43 logical blocks	21.5K
1377-1408 MB	44 logical blocks	22.0K
1409-1440 MB	45 logical blocks	22.5K
1441-1472 MB	46 logical blocks	23.0K
1473-1504 MB	47 logical blocks	23.5K
1505-1536 MB	48 logical blocks	24.0K

Volume Organization of Macintosh Standard Format
The first two logical blocks (labeled 0 and 1) of a volume are the boot blocks. This is where the information for mounting the volume is stored.

The third logical block (labeled 2) is the Master Directory Block, or MDB for short. This block contains part of the data structure of a flat directory volume. It contains the volume information and the volume allocation block map. This block is where the information for the hard disk, such as number of files in the directory and the last time the drive was initialized, is stored.

Logical blocks 3 to x (see the following table) contain the volume bitmap. This block is a data structure containing a sequence of bits, one bit for each allocation block. The volume bitmap stores a reference to every piece of data that is in the allocation blocks and indicates whether the block is allocated or free for use. Volume bitmaps exist both on hierarchical directory volumes and in memory.

Volumes may have as few as 32,768 allocation blocks and as many as 65,536 allocation blocks. This table defines what logical block the volume bitmap ends on based on the number of allocation blocks:

.	Allocation Blocks	Last Volume Bitmap Logical Block
.		
.	> 61,440	18
.	> 57,344	17
.	> 53,248	16
.	> 49,152	15
.	> 45,056	14
.	> 40,960	13
.	> 36,864	12
.	> 32,768	11

Allocation blocks begin after the volume bitmap. Contained in the allocation blocks are the catalog, extents and data files.

The catalog file is a list of all files and folders stored in a volume. The catalog file maintains the relationships between the files and directories on a hierarchical directory volume. It corresponds to the file directory on a flat directory volume. The catalog file is organized and accessed using a B-tree structure. The files are arranged in alphabetical order evenly balanced on the tree so that finding a "Z" doesn't take any longer than finding an "A". This structure is the glue that keeps the catalog file together.

The extents tree file contains the locations of all the files on a volume (An extent is a series of contiguous allocation blocks). The extents tree file is where the information (such as where to find file, and how many extents a file is divided into) about the data files you have created is stored. Any given file you create may be broken up into multiple extents. When extents are linked together, behind the scenes, with information from the extents tree file, the appearance is of one data file.

The next, and largest, section of the volume contains all the actual data files and applications which are referenced using the above files.

The next to last block on the hard disk contains the alternate master directory. This alternate is a backup to the MDB kept on logical block 2. It is used when the file manager determines that the MDB is corrupt and needs to be rewritten with the correct information.

The very last block is empty. It is used to check for bad sections of the hard disk.

What You Can Do
So, can you do anything to decrease the file size on a large hard drive? One solution is to partition larger drives into smaller partitions, or logical drives, each with a maximum of 65,536 blocks.

Apple's Drive Setup can be used to partition qualified Apple hard drives and some removable devices as listed in the Drive Setup Guide file. Unsupported hard drives will show up in the device list by name, however, if you select an unsupported hard drive you will get the message, "Cannot modify a disk in an unsupported drive."

Drive Setup is supported on all of the Power Macintosh computers. This includes the original Power Macintosh computers and the new PCI-based Power Macintosh computers. Drive Setup is also compatible with 68040 and 68LC040 processor-based systems that have IDE drives installed. Drive Setup is not supported with the Power Macintosh Upgrade Card. Drive Setup 1.0.2 is available from online services.

There are third parties that offer a solution for creating multiple Macintosh partitions on Macintosh systems not supported by Drive Setup. A few are:

- Hard Disk Toolkit (HDT) by FWB Software, Inc.
- Silverlining by La Cie Ltd.
- Micronet Utility by MicroNet Technology
- MicroTech Utility by MicroTech International
- Drive 7 by Casa Blanca Works, Inc.

Mac OS Extended Format
In 1998, concurrent with the release of Mac OS 8.1, Apple released a new file system format known as Mac OS Extended Format (sometimes referred to as HFS Plus). For more information on Mac OS Extended Format, please see the following technical documents:

30344: "**Mac OS 8.1: About Mac OS 8.1 Extended Format**"
24601: "**Mac OS Extended Format: Volume And File Limits**"

This document provides information about a non-Apple product. Apple, Inc. is not responsible for its content. Please contact the vendor for additional information. Document 17159: "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

Bluetooth: How to Delete a Paired Device

This document explains how to delete a Bluetooth device from the list of devices paired with your computer.

This article has been archived and is no longer updated by Apple.

You can delete a paired device in Bluetooth preferences. Follow these steps:

1. Choose Apple menu -> System Preferences.
2. Click Bluetooth.
3. Click Devices.
4. Select the device you want to delete from the Bluetooth Devices listing.
5. Click the Delete Pairing button.
6. Click Delete or "Disconnect and Delete".

To use this device with your computer again, use the Bluetooth Setup Assistant to pair them again.
Note: Some Bluetooth devices (such as keyboards and mice) are designed to be paired and used with one computer at a time. If you pair your keyboard or mouse with another computer, delete the pairing with the original computer first. This will ensure that the device only attempts to operate with the intended computer.

Apple Wireless Mouse: About the Red Light

By viewing the red light on the bottom of the Apple Wireless Mouse, you can determine whether the mouse is turned on and correctly paired with your computer.

This article has been archived and is no longer updated by Apple.

The light can be in four modes. Find your mouse's light in the list below to determine what state your mouse is in.

Solid red light - Paired
A solid red light means the mouse is turned on and paired with a computer. The red light will also stay solid if the mouse is being moved.

Slowly flashing red light (blink, blink, pause) - Can't Find Computer
If the light is slowly flashing on and off, this means the mouse is looking for a computer to pair with. For more information, see technical document 86468, "**Bluetooth: How to Set Up Your Apple Wireless Mouse**".

Quick flashing red light - Saving Power
If you do not move the mouse for one second, it will go into a low power mode (indicated by a quick-flashing red light). The quick flashes may slow down over the next few seconds - these different flash speeds indicate various levels of low power mode.

No light - No Power to Mouse or Mouse is Asleep
If you've turned on the mouse and the light doesn't turn on, try moving the mouse on an opaque surface. Make sure the host computer is not asleep either. If the light still doesn't turn on, the battery levels may be too low to power the mouse. Replace the mouse's batteries. See technical document 86472, "**Apple Wireless Mouse: How to Install or Replace Batteries**".

If the light doesn't turn on after you change the batteries, the mouse may need to be repaired. Call Apple for instructions on this.

Desktop computers: Troubleshooting wireless keyboard and mouse issues in Mac OS X v10.5

Some desktop computers with wireless keyboards or mice are shipped with the devices pre-paired and the batteries pre-installed. As long as the wireless devices are powered on when the computer starts up, no additional steps should be necessary to make them work.

This article has been archived and is no longer updated by Apple.

If one or both of the wireless devices do not function as expected, use the information below to identify and resolve the issue.

Note: These instructions work with Mac OS X v10.5 Leopard. For troubleshooting wireless keyboard and mouse issues in Mac OS X v10.6 Snow Leopard, see Desktop computers: Troubleshooting wireless mouse and keyboard issues.

Make sure the wireless keyboard and mouse are turned on

If the system has already started up and the keyboard or mouse indicator light is flashing, the keyboard or mouse is "discoverable" by the computer and may not currently be paired with the computer. For more information on pairing wireless devices refer to How to set up your Apple Wireless Keyboard.

Reset the Bluetooth device
First try turning your device off and then on again. Once powered on, the wireless device will remain in the "discoverable" mode for three minutes. For more info refer to Enabling discoverable mode.

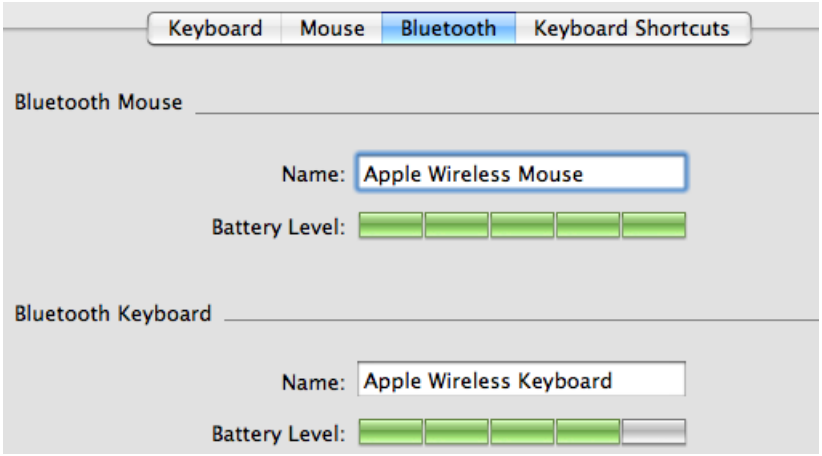
Restart the computer
Try restarting your computer to see if that addresses the issue. If not, try shutting down your computer, waiting a minute, and then starting it back up again.

Check battery levels

Your Mac will inform you when you should replace the batteries in the keyboard and mouse. You can also manually check the battery level of the Apple Wireless Keyboard and Apple Wireless Mouse by following these steps:

1. Choose **System Preferences** from the **Apple (□)** menu.
2. Choose **Keyboard & Mouse** from the **View** menu.
3. Select the Bluetooth tab.

Note: The battery indicator does not show battery levels of non-Apple Bluetooth mice and keyboards. If you don't see a battery indicator, make sure you are using an Apple Wireless Mouse or Keyboard.



Check for signal interference
Because Bluetooth works by transmitting signals through the air, some things can interfere with the wireless connection. Avoid situations in which metal objects come between the device and the computer. Don't put the computer under a metal desk or locked away behind a metal cabinet. Keep cordless phone base stations, microwave ovens, and other electrical devices that operate on a 2.4 GHz bandwidth away, and make sure that the wireless device and computer aren't more than 30 feet apart from each other.

Power Mac G5, Apple Hardware Test 2.1: Interpreting Certain Error Messages

Learn how to interpret three Apple Hardware Test (AHT) 2.1 errors: "2FAN/4/x: Fan For BACKSIDE", "2FAN/4/x: Fan For SLOT", and "2STH/x/x: xxxx AMB".
This article has been archived and is no longer updated by Apple.

Symptom

Two error codes in Apple hardware Test (AHT) 2.1 may indicate an error when there is no error:

2FAN/4/x: Fan For BACKSIDE
(The "x" will be a number.)
This error code usually means the fan behind the drive bay has failed. This fan is a "blower" type fan, located behind the drive bay fan. The drive bay fan is located between the hard drive and the SuperDrive.

2FAN/4/x: Fan For SLOT
(The "x" will be a number.)
This error code usually means the slot fan has failed. The slot fan is located in front of the PCI slots near the front of the computer and just under the SuperDrive.

2STH/x/x: xxxx AMB
(The "x" will be a number and "xxxx" will identify a sensor.)
This error code usually means an ambient thermometer sensor has failed.

Solution

When you see "2FAN/4/x: Fan For BACKSIDE" or "2FAN/4/x: Fan For SLOT", there's probably nothing wrong with the fans. To make sure the fans are working:

1. Remove the outer door, leaving the inner air deflector in place.
2. Look at the slot fan to see if it is working. (Compare the fan appearance when the computer is turned off, and when the computer is turned on. If the fan "disappears" when the computer is on, it is working.)
3. If the fan is not working, take the computer to an Apple Authorized Service Provider for repairs.
4. Apple Hardware Test 2.1 has been updated to 2.1.1 and contains a revised fan test. Contact Apple Support to get the updated version.
5. When you get the updated Apple Hardware Test, check the fans in your computer to make sure they're working.

When you see "2STH/x/x: xxxx AMB", there's probably nothing wrong with the ambient sensors.

1. Apple Hardware Test 2.1 has been updated to 2.1.1 and contains a revised ambient thermometer test. Contact Apple Support to get the updated version. It is expected to be available by mid November 2003.

2. When you get the updated Apple Hardware Test, check the ambient sensors in your computer to make sure they're working.

If other error codes appear, your computer may need to be repaired. See the AppleCare Service and Support documentation that came with your Power Mac G5 or go to the Apple Support website for service options (http://www.apple.com/support/).

Apple Wireless Mouse: Passkey Alert When Pairing

When you pair your Apple Wireless Mouse and your computer, you see an alert asking for a passkey.

This article has been archived and is no longer updated by Apple.

Symptom

You see this alert:

> "Enter a passkey to pair with your mouse.
> "A passkey is needed to complete a pairing between this computer and the mouse. This number will only be used once. You do not need to remember this number. When asked, you will be provided with this number to enter on your (null)."

Figure 1 "Passkey" alert

This alert appears if your computer does not meet the system requirements to use the mouse.

Solution

1. Make sure your computer has Mac OS X 10.2.6 or later installed. See technical document 106704, "**Mac OS X: How to Update Your Software**".
2. Install the software from the disc that came with your Apple Wireless Mouse. For more information, see technical document 86468, "**Bluetooth: How to Set Up Your Apple Wireless Mouse**".

Mac OS X: Remaining Battery Time Is Inaccurate

Some iBook and PowerBook computers may not accurately report the remaining battery time in the menu bar.
This article has been archived and is no longer updated by Apple.

Symptom

The estimated remaining battery time that appears in the menu bar is less than the actual usage you get from the battery.

Solution

Download and install Mac OS X 10.2.8 or later. You can get the update using the Software Update feature in System Preferences.

1. Connect to the Internet.
2. From the Apple menu, choose System Preferences
3. From the View menu, choose Software Update.
4. Click the Check Now button. Software Update checks for new software you can install on your computer.
5. If a new Mac OS X update is not recommended, you already have the latest update. Stop here.
6. If a Mac OS X update appears, click the Install button. Software Update downloads and installs the software.
7. When the installation is complete, click the Restart button to restart your computer.

To see which version of Mac OS X is on your computer:

1. From the Apple menu, choose About This Mac. A new window appears.
2. Look at the version number (for example, "10.2.8"). It appears below the Mac OS X logo.

Figure 1 About This Mac window

3. Click the version number. The Build version appears.

Figure 2 Build version

If you have Mac OS X 10.2.8 (Build 6R65), you should install the latest update.

PowerBook G4 (12-inch): Adapters and Resolutions

Learn about the different style video output ports offered for the PowerBook G4 (12-inch), PowerBook G4 (12-inch DVI), PowerBook G4 (12-inch 1.33GHz) and PowerBook G4 (12-inch 1.5GHz) computers as well as the resolutions that work with them. For iBook adapters, see technical document 88396, "**iBook: Adapters and Resolutions**".
This article has been archived and is no longer updated by Apple.

Video Adapter

The Apple Video Adapter has an S-video connector as well as a composite video style connector, which is a convenient way to connect the PowerBook to a television or a video projector.

The Apple Video Adapter does not work with earlier iBook computers with an VGA output port, and will not work with the iMac (Flat Panel) computer's VGA output port. This adapter is included with the PowerBook G4 (12-inch) computer.

Compatible computers

- iBook (16 VRAM)
- iBook (14.1 LCD 16 VRAM)
- iBook (Opaque 16 VRAM)
- iBook (32 VRAM)
- iBook (14.1 LCD 32 VRAM)
- PowerBook G4 (12-inch)

Resolutions

NTSC Resolutions

- 640 by 480 60 Hz (NTSC)
- 800 by 600 60 Hz (NTSC)
- 1024 by 768 60 Hz (NTSC)

PAL Resolutions

- 640 by 480 50 Hz (PAL)
- 800 by 600 50 Hz (PAL)
- 1024 by 768 50 Hz (PAL)

Apple Mini-DVI to DVI Adapter

The Apple Mini-DVI to DVI Adapter allows the PowerBook G4 (12-inch DVI), PowerBook G4 (12-inch 1.33GHz) or PowerBook G4 (12-inch 1.5GHz) to be connected to a display with a standard DVI-D connector. This adapter can also be used to connect an Apple flat-panel display with an ADC connector with the help of the Apple DVI to ADC Adapter (sold separately).

The Apple Mini-DVI to DVI Adapter does not work with PowerBook G4 (12-inch) computers, and will not work with the iMac (Flat Panel) computer's VGA output port. This adapter is included in the box with PowerBook G4 (12-inch DVI), PowerBook G4 (12-inch 1.33GHz) and PowerBook G4 (12-inch 1.5GHz) computers.

Compatible computers

- PowerBook G4 (12-inch DVI)

- PowerBook G4 (12-inch 1.33GHz)
- PowerBook G4 (12-inch 1.5GHz)

Resolutions

- 640 by 480 pixels at 60 Hz
- 800 by 600 pixels at 75 Hz
- 1024 by 768 pixels at 75 Hz

Apple Mini-DVI to VGA Adapter

The Apple Mini-DVI to VGA Adapter allows the PowerBook G4 (12-inch DVI), PowerBook G4 (12-inch 1.33GHz) or PowerBook G4 (12-inch 1.5GHz) to be connected to a VGA display.

The Apple Mini-DVI to VGA Adapter does not work with PowerBook G4 (12-inch) computers, and will not work with the iMac (Flat Panel) computer's VGA output port. This adapter is included in the box with PowerBook G4 (12-inch DVI), PowerBook G4 (12-inch 1.33GHz) and PowerBook G4 (12-inch 1.5GHz) computers.

Compatible computers

- PowerBook G4 (12-inch DVI)
- PowerBook G4 (12-inch 1.33GHz)
- PowerBook G4 (12-inch 1.5GHz)

Resolutions

- 640 by 480 pixels at 60 Hz
- 800 by 600 pixels at 75 Hz
- 1024 by 768 pixels at 75 Hz

Apple Mini-DVI to S-Video/Composite Adapter

The Apple Mini-DVI to S-Video/Composite Adapter has an S-video connector as well as a composite video style connector, which is a convenient way to connect the PowerBook G4 (12-inch DVI), PowerBook G4 (12-inch 1.33GHz) or PowerBook G4 (12-inch 1.5GHz) to a television or a video projector.

The Apple Mini-DVI to S-Video/Composite Adapter does not work with PowerBook G4 (12-inch) computers, and will not work with the iMac (Flat Panel) computer's VGA output port. This adapter does not come with the PowerBook G4 (12-inch DVI), PowerBook G4 (12-inch 1.33GHz) or PowerBook G4 (12-inch 1.5GHz) computer, but can be purchased from the Apple Store.

Compatible computers

- PowerBook G4 (12-inch DVI)
- PowerBook G4 (12-inch 1.33GHz)
- PowerBook G4 (12-inch 1.5GHz)

Resolutions

NTSC Resolutions

- 640 by 480 60 Hz (NTSC)
- 800 by 600 60 Hz (NTSC)

- 1024 by 768 60 Hz (NTSC)

PAL Resolutions

- 640 by 480 50 Hz (PAL)
- 800 by 600 50 Hz (PAL)
- 1024 by 768 50 Hz (PAL)

Installer Fails With 2 GB or More of RAM

Some installers may not work properly if the computer has 2 GB or more of RAM installed.

This article has been archived and is no longer updated by Apple.

Symptom

You try to install software on a computer with 2 GB or more of RAM, but an alert with this message appears:

> "The software to be installed requires 8 MB of total machine memory (RAM), which this computer does not have."

Solution

Be sure you are using an up-to-date installer. Most of the installers with this issue have been updated and work as expected. Contact the developer of the software directly to determine the latest version of the installer.

Power Mac G5: How to Identify 3.3 V and 5 V PCI Cards

Learn how to differentiate 3.3-Volt (V) and 5-Volt PCI cards.
This article has been archived and is no longer updated by Apple.
The Power Mac G5 computer only works with 3.3 V PCI cards. Some older PCI cards require 5 V and cannot be used with the Power Mac G5. The Power Mac G5 computer is designed to the PCI-X 2.1 specification, which requires 3.3 V signaling.

The older 5 V cards are keyed differently from 3.3 V cards and will not fit into the computer's PCI slot. Figures 1 and 2 show the differences between these cards. Figure 1 shows compatible and incompatible cards: cards that look like those illustrated on the left side of Figure 1 are 3.3 V and are electrically compatible. Cards that look like those illustrated on the right side of Figure 1 are 5 V and are not compatible with a Power Mac G5 computer.
Figure 2 shows the four key variations that are accepted in Power Mac G5 PCI slots.

Figure 1 PCI cards and slots: left - 3.3 V; right - 5 V

Power Mac G5: Leave the Door Shut When the Computer Is On

For best performance, you should leave your Power Mac G5 computer's door shut when it's in use.

This article has been archived and is no longer updated by Apple.

Your Power Mac G5 was designed to be used with the outer access panel (door) in place at all times. The outer and inner doors work together to direct airflow to cool the components inside the computer, as well as block electromagnetic interference, as required by the FCC. Using the computer with the door open changes the airflow, which can prevent the computer from performing as expected.

About DVI Adapters

Learn about Apple and non-Apple DVI adapters.

This article has been archived and is no longer updated by Apple.

Using a DVI (digital video interface) adapter, you can connect an external display to a Mac with a DVI monitor port, such as the PowerBook G4 (DVI).

A variety of Apple DVI adapters are available to use with your computer and monitor. You can buy them from the Apple Store (http://www.apple.com/store), or your Apple reseller. To be sure you have the right adapter, see technical document 33001, "**Monitor and Display Adapter Table**".

Other companies also make DVI adapters. Some non-Apple adapters may not work exactly the same way the Apple adapters do. For example with a non-Apple adapter, when you disconnect your monitor while the computer is turned on, the Mac OS may not be able to tell you've disconnected the monitor until you put the computer to sleep and wake it up again, or until you select "Detect Displays" from the Displays pane of System Preferences.

Apple Hardware Test 2.0.1: PowerBook G4 (15-inch FW 800) and (17-inch 1.33GHz) Read Me

The PowerBook G4 (15-inch FW 800) and (17-inch 1.33GHz) Install and Restore DVD contains Apple Hardware Test.

This document contains the Read Me that is included with Apple Hardware Test 2.0.1.

This article has been archived and is no longer updated by Apple.

About Apple Hardware Test

Apple Hardware Test diagnoses and detects problems with your computer's internal hardware components, such as the logic board, memory, modem, video RAM, and AirPort Extreme Card. It does not check external hardware components, such as USB or FireWire devices, nor does it check for operating system (OS) or software-related problems, such as application or extension conflicts.

You can start up your computer with Apple Hardware Test in the Software Install and Restore DVD even if the machine will not start up under the Mac OS.

Version 2.0.4 of Apple Hardware Test for PowerBook is distributed with the 15-inch and 17-inch Apple PowerBook G4 computers introduced in 2003. It will not work with any other computer.

Using Apple Hardware Test
Before using Apple Hardware Test, disconnect all external devices with the exception of keyboard, mouse, display, and speakers. You should also disconnect the Ethernet network cable. Print out these instructions before proceeding with the following steps.

1. Restart your computer from the Software Install and Restore DVD, holding down the Option key while the computer restarts. Continue to hold down the Option key until a list of available bootable devices appears.

2. Select Apple Hardware Test and click the right arrow. The Loading icon then appears. Loading takes about 45 seconds.

3. When the Apple Hardware Test main screen appears, follow the onscreen instructions.

If Apple Hardware Test detects a problem, it displays an error code. Make a note of the error code before pursuing support options. If Apple Hardware Test does not detect a hardware failure, the problem may be software related.

Known Issues
If your PowerBook has more than 512 MB of RAM, the Extended Test may take significantly more time than indicated on the screen.

Your PowerBook can use memory modules or DIMMs even when the Power On SelfTest, which runs when the machine is turned on, detects part of a module as being bad. When you start up your computer, Apple Hardware Test reports failed memory modules in the Hardware Tests panel.

While the video RAM is being tested, it is normal for the screen to appear blank or turned off for extended periods of time, depending on how much video RAM is installed.

Recommendations for Resolving Problems with Your Computer

- Turn the computer off and on properly.

  You can often eliminate problems by turning off your computer as recommended. To turn off your computer, choose Shut Down from the Apple (□) menu. Do not turn off the computer by turning off the switch on a power strip or by pulling the computer's power plug. Restart your computer by pressing the power button. To restart your computer when it is on, choose Restart from the Apple (□) menu.

- Check cables, peripherals, and controls.

  To see if cables or peripherals are causing conflicts with your system, shut down your computer. Disconnect the cables and peripherals,

such as printers, scanners, cameras and external mass storage devices. Then reconnect the cables and peripherals and restart your system. You can also adjust the controls on your monitors and other peripherals.

- Start up from the Software Install and Restore DVD that came with your computer.

  Start your system from the Software Install and Restore DVD by holding down the C key until you see the Apple logo. If the system works properly when started (booted) from the Software Install and Restore DVD, the problem may be related to the software installed on your computer.

- Refer to Mac Help and the Internet for assistance.

  Mac Help, located in the Help menu, includes a wealth of technical information. The AppleCare Knowledge Base and other resources for technical help and support are available 24 hours a day at www.apple.com/support.

- Reinstall the Mac OS.

  In many cases, a clean installation of the Mac OS fixes recurring problems. Make sure you back up the data on your hard drive before reinstalling the OS. Follow the instructions in the Read This First document in the Software Install and Restore DVD to reinstall the Mac OS.

- Contact AppleCare Service and Support for assistance.

  If the above steps don't resolve the problem, please review the service and support material that came with your computer for information on contacting AppleCare.

Xserve: Won‘t Start Up, Activity Lights Flash Three Times

Learn what it means if the activity lights flash three times when you try to start up your server.
This article has been archived and is no longer updated by Apple.

Symptom

The server does not start up; the activity lights flash three times when you try to start the server.

Solution

When the activity lights flash three times, this means that incompatible RAM is probably installed.

Install the correct memory:

Server	SDRAM type
Xserve	PC2100 DDR
Xserve (Slot Load)	PC2700 DDR
Xserve (Cluster Node)	PC2700 DDR

Check the installed memory

1. If the SDRAM appears to be the correct type, check the server using Apple Hardware Test. If the test finds bad memory, replace it (one DIMM at a time) with known good SDRAM and repeat the test until it reports that every DIMM is OK.
2. If all DIMMs are known good memory and the issue still occurs, the logic board may need to be replaced.

Note: When installing the replacement logic board, make sure the ports and ID button on the back of the board align with the opening in the chassis.

Published Date: Feb 20, 2012

Xserve: Won‘t Start Up, Activity Lights Flash Four Times

Learn what it means if the activity lights flash four times when you try to start up your server.
This article has been archived and is no longer updated by Apple.

Symptom

The server does not start up; the activity lights flash four times when you try to start the server.

Solution

When the activity lights flash four times, this means that none of the RAM banks passed memory testing.

Install the appropriate memory:

Server	SDRAM type
Xserve	PC2100 DDR
Xserve (Slot Load)	PC2700 DDR
Xserve (Cluster Node)	PC2700 DDR

Check the installed memory

1. If the SDRAM appears to be the correct type, check the server using Apple Hardware Test. If the test finds bad memory, replace it (one DIMM at a time) with known good SDRAM and repeat the test until it reports that every is DIMM OK.
2. If all DIMMs are known good memory and the issue still occurs, the logic board may need to be replaced.

Note: When installing the replacement logic board, make sure the ports and ID button on the back of the board align with the opening in the chassis.

Xserve: Won‘t Start Up, Activity Lights Flash Five or Six Times

Learn what it means if the activity lights flash five or six times when you try to start up your server.
This article has been archived and is no longer updated by Apple.

Symptom

The server does not start up; the activity lights flash five or six times when you try to start the server.

Solution

When the activity lights flash five or six times, this means that the server's ROM may be bad.

Try each of these steps in order, testing in between steps to see if the server starts:

1. Remove the processor module and reinsert it securely.
2. Replace the processor module.
3. Replace the logic board.

Note: When installing the replacement logic board, make sure the ports and ID button on the back of the board align with the opening in the chassis.

AppleShare Admin: What To Do If You Lose the Password

If I have lost or forgotten the Administrator's password on an AppleShare file server, what do I do?
This article has been archived and is no longer updated by Apple.
If you have forgotten the Admin key, refer to the following sources:

Warning: All of the procedures listed below require a back-up copy of the "Users & Groups" file. Be sure that you have a back-up copy of this file before starting the procedure.

AppleShare 1.0 or 1.1 File Server
See page 137, chapter 6, in the "AppleShare Administrator's Guide." Below is the information referenced in the "AppleShare Administrator's Guide":

You have forgotten the Admin key

If you forget the Admin key that you use while opening AppleShare Admin and don't have it written down, you'll have to:

1. Use the AppleShare Server Installer disk to start up the server's Macintosh Plus.

2. While in the Finder, locate the Users & Groups file in the Server Folder of the startup volume, drag it to the Trash, and choose Empty Trash from the Special menu.

3. Open the AppleShare Admin application.

4. Select the same startup volume that you had before.

5. When you're asked to select a Users & Groups file, select the backup copy of the Users & Groups file. Click Volume until you see the disk name. Click Eject to insert another disk. If necessary, open any folders in the list until you see the backup copy of the file. Select the file and click Open.

6. When asked, type the server name and the new Admin key.

7. Continue to follow the procedure for preparing the server.

AppleShare 2.0 or 2.0.1 File Server
See page 204, chapter 7, in the "AppleShare File Server Administrator's Guide." Below is the information referenced in the "AppleShare Administrator's Guide":

You've forgotten the Admin key

If you forget the Admin key that you use to open AppleShare Admin and don't have a written copy, you'll have to use the following procedure.

1. Use the Server Administration disk to start up the server's Macintosh.

2. While in the Finder, locate the Users & Groups file in the Server Folder of the startup volume, and then drag it to the Trash and choose Empty Trash from the Special menu.

3. Open the AppleShare Admin application.

4. Prepare the same startup volume you had before.

5. When you're asked to select a Users & Groups file, select the backup copy of the Users & Groups file. Click Volume until you see the disk name. (If necessary, click Eject and then insert another disk.) Open any necessary folders in the list until you see the backup copy of the file. Select the file and click Open.

6. When asked, type the new Admin key.

7. Continue to follow the procedure for preparing the server.

AppleShare 3.0 or 3.0.1 File Server

See page 147, chapter 8, in the "AppleShare Server 3.0 Administrator's Guide." Below is the information referenced in the "AppleShare Administrator's Guide":

You've forgotten your Admin key

The Admin key is stored in the Users & Groups Data File. If you forget the Admin key, drag the Users & Groups Data File out of the Preferences folder to the root level of the System Folder. Then restart the Admin program. In a moment the program will ask you to provide a new file server name and Admin key. Enter the same file server name, and a new Admin key.

AppleShare 4.0 File Server
See page 107, chapter 6, in the "AppleShare Administrator's Guide" (p/n 030-4205-A), or see page 93, chapter 5, in the "AppleShare Administrator's Guide" (p/n 030-6925-A) Also remember the serial number. Below is the information referenced in the "AppleShare Administrator's Guide":

You've forgotten your Admin Key.

The Admin Key is stored in the Users & Groups Data File. If you forget the Admin Key, quit the AppleShare Admin and AppleShare File Server programs. Then drag the Users & Groups Data File out of the Preferences folder to the System Folder. Then restart the Admin program. In a moment the program will ask you to provide a new file server name and Admin Key. Enter the same file server name, and a new Admin Key.

Following this procedure assigns a new Admin Key and creates a new Users & Groups Data File in the Preferences folder. All of the original user and group accounts, passwords, and access privileges for shared volumes are copied from the old Data File in the System Folder. You can now delete the old Data File.

AppleShare Pro File Server
See page 106, chapter 6, in the "AppleShare Pro Administrator's Guide." Below is the information referenced in the "AppleShare Administrator's Guide":

You've forgotten your Admin Key.

The Admin Key is stored in the Users & Groups Data File. If you forget the Admin Key, quit the Admin program (and File Server program, if necessary). Then drag the Users & Groups Data File out of the Preferences folder to the top level of the System Folder. Do not drag it out of the System Folder. (Use the System Folder alias to open the System Folder.) Then restart the Admin program. In a moment the program will ask you to provide a new file server name and Admin Key. Enter the same file server name, and a new Admin Key.

Following this procedure merely assigns a new Admin Key. All of the original user and group accounts, passwords, and access privileges for shared volumes are retained. After you've restarted the Admin program, you can throw away the copy of the Users & Groups File you moved from the Preferences folder. It is replaced by a new one within the Preferences folder.

AppleShare IP 5.x
The information is on page 278 of the "AppleShare IP 5.0 Administrator's Manual"

AppleShare IP 6.x
The information is in the "ASIP 6.x Tutorial" on the AppleShare CD. See the section "Troubleshooting Web & File Services."

iBook, Mac OS X 10.3: Cannot Calibrate Display

You may find your iBook display does not calibrate if you are running Mac OS X 10.3 or Mac OS X 10.3.1.
This article has been archived and is no longer updated by Apple.

Symptom

The display contrast may be high on some early iBook computers when running Mac OS X 10.3 or 10.3.1 or when started up from the Mac OS X 10.3 Install CD. The display could be described as looking "washed out" or the text as looking "blocky" (not smoothed).

Only "Generic RGB Profile" and "sRGB Profile" appear in Display preferences. When you click Calibrate, this message appears: "Can not calibrate the display. The factory profile for the display could not be found."

Solution

Update to Mac OS X 10.3.2 or later.
Published Date: Oct 11, 2016

Apple Displays: About Wall, Desk, and Rack Mounts

Find out what options are available for mounting Apple LCD displays to a desk, wall, or an equipment rack.
This article has been archived and is no longer updated by Apple.
Apple does not make alternate mounting systems for these displays:

- Apple Studio Display 17 (LCD)
- Apple Cinema Display
- Apple Cinema Display 20-inch
- Apple Cinema HD Display

Third-party companies make alternate mounting products for Apple displays. Two companies are listed below. This list is not all-inclusive. For more options, see the Macintosh Products Guide (http://guide.apple.com/).

- Innovative Office Products (http://www.lcdarms.com/)
- Ergotron (http://www.ergotron.com/)

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

iMac (USB 2.0), PowerBook G4 (12-inch), PowerBook G4 (12-inch DVI), iBook G4: Audio CD or Disc Image Does Not Appear in Mac OS X 10.3

Audio CDs and disc images may not mount on a computer running a version of Mac OS X 10.3.

This article has been archived and is no longer updated by Apple.

Symptom

Audio CDs do not appear when you insert them into the drive. Other CDs and DVDs seem to work normally.

You may also notice that disc images do not appear, and double-clicking the disk image results in an error code -536870208.

Solution

Update to Mac OS X 10.3.2 or later.

Published Date: Oct 11, 2016

Apple Hardware Test: Power Mac G4 - Memory Identified as PC2600

If you run Apple Hardware Test on a Power Mac G4 (Mirrored Drive Doors) computer, the test may identify the memory as "PC2600" instead of "PC2700".

This article has been archived and is no longer updated by Apple.

Symptom

Apple Hardware Test identifies the computer's memory as "PC2600" rather than "PC2700".

Solution

There is nothing wrong with your computer's memory. This issue is addressed in Apple Hardware Test 1.2.7. If you have version 1.2.6 and are experiencing this issue, contact AppleCare for a replacement disc.

Mac OS X: Longer Startup Time After Installing Mac OS X 10.3.2 Update

In some cases, your computer may take longer to start up after installing Mac OS X 10.3.2 Update. This can happen if you update to Mac OS X 10.3.2 incrementally (from Mac OS X 10.3.1, for example), but does not happen if installing from a Mac OS X version 10.3.2 Install disc.
This article has been archived and is no longer updated by Apple.
Download and install Mac OS X 10.3.3 Update or later to address this issue.

If you're not ready to update, these tips can help:

If the computer's startup time is longer, follow these steps:

1. Open the Terminal (/Applications/Utilities/).
2. Type the following (on a single line). Alternatively, copy the text below and paste it into Terminal.

   ```
   sudo cp -p /System/Library/Extensions/BootCache.kext/Contents/Resources/BootCacheControl /usr/sbin/
   ```

   Note: There is a space before "/usr/sbin/".

3. Press Return.
4. When prompted, enter your admin password.

   Important: If the following message appears in Terminal, verify that step 2 was performed correctly. If so, you do not need to use these steps because your computer is not affected by this issue.

   Message: "cp: /System/Library/Extensions/BootCache.kext/Contents/Resources/BootCacheControl: No such file or directory"

5. Restart your computer.

Note: The first startup after this will still be longer. Subsequent startups will be faster.

This document will be updated as more information becomes available.

PowerBook G4 Trade-In Program

This document contains the text of the PowerBook G4 Trade-In Program PDF.
This article has been archived and is no longer updated by Apple.

PowerBook G4 Trade-In Program

This offer is available to selected individual owners of PowerBook G4 or PowerBook G4 (Gigabit Ethernet) computers in the United States. This offer is not open to resellers or distributors.

For a limited time only, customers considering upgrading their current PowerBook G4 or PowerBook G4 (Gigabit Ethernet) to a new 15" or 17" PowerBook G4 computer through Apple, can receive a $700 discount towards the purchase if they send in their current unit to Apple.

This offer is good while supplies last, however, the Program will end on March 27, 2004, and all customers wishing to participate must provide Apple with details of their new product purchase on or prior to that date.

All purchases must be paid for via major credit card only (Visa, MasterCard, American Express). Debit cards and check cards have daily spending limits, which may substantially delay the processing of the order. Apple is unable to accept credit cards issued by banks outside of the country of origin.

The discount applies only to purchases made through Apple on one of the following products:

- (Qty 1) M8980LL/A, PowerBook G4 15.2TFT/1GHz/256/60G/Combo/BT/56K
- (Qty 1) M8981LL/A, PowerBook 15.2TFT/1.25GHz/512(2 SO-DIMMS) /80G/SuperDrive/AIRPT/BT/56K
- (Qty 1) M9110LL/A, PowerBook G4 17TFT/1.33GHz/512DDR/80G/SuperDrive/56K/AIRPT/BT

To accept the offer and be eligible for the discount, customers must send in their computer and it must be received at Apple's warehouse within thirty (30) days from the date credit card details for the new computer purchase are provided to Apple. The main components on the customer's computer (i.e. LCD display, hard disk drive, optical drive and main logic board) must not be damaged or otherwise inoperable, and the computer as a whole must not be damaged as a result of misuse, such as physical abuse or liquid spills. All PowerBook computers received by Apple that are eligible under the Program become the property of Apple and will not be returned.

Data backup and restoration from the current PowerBook is the customer's responsibility. Data can be backed up via the Internet, removable disk storage, networks, etc. Any add-ins made to the customer's computer must be removed before sending the PowerBook to Apple. Apple will not be responsible for transferring add-ins, such as additional RAM, to the new machine, nor will Apple be responsible for returning add-ins to the customer. If add-ons, such as additional RAM or larger hard drives are removed, the computer should be replaced with the components that came in the original configuration.

Apple will cover the cost of shipping, including facilitating the shipment of the customer's computer to Apple. The shipping address to which the new product is sent must be within the continental United States, Alaska, and Hawaii. No shipments can be made to post office boxes, APO addresses, United States territories, or addresses outside the United States. All new Apple hardware products carry a one-year Limited Warranty against defects in materials and workmanship. You may review a copy of the One-Year Limited Warranty offered with new products, together with all applicable sales terms to the purchase by visiting:

http://store.apple.com/Catalog/US/Images/salespolicies.html

This offer is not valid in conjunction with any other Apple offer or promotion, except as otherwise specifically permitted by the terms and conditions of such other offer or promotion. This offer is void where prohibited or restricted by law. Apple reserves the right to change the Terms and Conditions or end the offer at any time without notice. Apple is not responsible for any additional equipment sent to Apple that is not required under the terms of the offer, nor is it responsible for any equipment missing from the shipping package sent to Apple.

If you are interested in participating in this program, please call AppleCare at 800-APL-CARE (800-275-2273).

PowerBook G4 (15-inch FW 800) and (17-inch 1.33GHz): How to Run Apple Hardware Test

Learn how to use Apple Hardware Test on a PowerBook G4 (15-inch FW 800) or (17-inch 1.33GHz) computer.
This article has been archived and is no longer updated by Apple.
If you have a PowerBook G4 (15-inch FW 800) or (17-inch 1.33GHz) computer, Apple Hardware Test (AHT) is included on the same DVD disc you use to install or restore software. It is named "PowerBook G4 15-inch and 17-inch Software Install and Restore".

Running Apple Hardware Test

To use AHT on your PowerBook G4 (15-inch FW 800) or (17-inch 1.33 GHz) computer, follow these steps:

1. Insert the disc named "PowerBook G4 15-inch and 17-inch Software Install and Restore" into the computer.
2. Click on the Apple icon in the menu bar and choose Restart.
3. Press the Option key as the computer starts up. The startup manager appears (Figure 1).
4. Click the Apple Hardware Test volume in the startup manager.

Figure 1 Startup manager

5. Click the arrow that points to the right.
6. Follow the onscreen instructions.

PowerBook G4 (15-inch FW 800): Sound Specifications

Learn about the sound specifications for the PowerBook G4 (15-inch FW 800) computer.
This article has been archived and is no longer updated by Apple.
The PowerBook G4 (15-inch FW 800) computer has an audio line-in port, headphone port, integrated microphone, two stereo speakers, and a midrange-enhancing speaker.

The audio line-in port is a stereo 3.5 mm mini-phono jack that allows the connection of a line-level microphone or other audio equipment.

The headphone port also uses a 3.5 mm mini-phono jack and provides enough current to drive a pair of low-impedance headphones. It can support external speakers (which may require external power) or other sound output devices.

The integrated microphone is located underneath the left speaker grill near the Tab key.

The PowerBook G4 (15-inch FW 800) computer includes two stereo speakers, located beneath the speaker grills on each side of the keyboard.

The PowerBook G4 (15-inch FW 800) computer also has a midrange-enhancing speaker, designed to produce a separate channel of midrange sound. The midrange speaker is located underneath and to the left of the space bar. There are no settings in the Sound pane of System Preferences to adjust the midrange speaker independently. Increasing and decreasing the system volume changes both the stereo speakers and the midrange speaker at the same time.

Xserve: Rack mount solutions

This article has been archived and is no longer updated by Apple.

Learn about supported and unsupported rack mount solutions for Xserve, Xserve (Slot Load), Xserve G5, and Xserve (Late 2006).

Some rack manufacturers advertise and sell racks for use with Xserve that mount the server vertically. This configuration has not been tested and may cause thermal or other unexpected issues.

To avoid thermal issues, it is important that the Xserve, Xserve (Slot Load), Xserve G5 and Xserve (Late 2006) have unrestricted front-to-back airflow. You can monitor the temperature of your Xserve from the Server Monitor software, which also displays the status of the fans.

Supported rack solutions for the Xserve, Xserve (Slot Load), and Xserve G5 include EIA-310-D-compliant, industry-standard 19-inch wide racks, including four-post racks (24 inches , 26 inches , and from 29 to 36 inches deep) and two-post Telco racks (center-mount brackets included).

Supported rack solutions for the Xserve (Late 2006) include most EIA-310-D-compliant, industry-standard 19-inch wide, four-post racks and cabinets (24 to 36 inches deep). The standard quick-deployment rails support square-hole racks and eliminate the need for cage nuts, while quick-deployment rails supporting threaded (10/32") racks are available as a configurable option.

PowerBook G4 (17-inch 1.33GHz): White Lines on External Display

Update to Mac OS X 10.2.8 or later if you see white lines on an external display connected to the computer.
This article has been archived and is no longer updated by Apple.

Symptom

Flashing vertical lines or short, white, flashing horizontal lines appear on a display connected to the computer.

This might happen if the computer's built-in display is closed, and you're playing some types of games on an external display.

Solution

Download and install Mac OS X 10.2.8 or later. It is available in Software Update preferences, or from Apple Downloads (http://www.apple.com/swupdates/).

Published Date: Feb 20, 2012

PowerBook G4 (17-inch 1.33 GHz): Internal Microphone Not Working on Battery Power

Update to Mac OS X 10.2.8 or later if the computer's internal microphone does not work when running on battery power.
This article has been archived and is no longer updated by Apple.
In some versions of Mac OS X 10.2, the PowerBook G4 (17-inch 1.33 GHz) computer's internal microphone does not work when the computer is running on battery power.

Download and install Mac OS X 10.2.8 or later, which allows the microphone to work on battery power. It is available in Software Update preferences, or from Apple Downloads (http://www.apple.com/swupdates/).

Xserve RAID: No Status During Rebuilds

Find out how RAID Admin behaves while a RAID set is being initialized or rebuilt.

This article has been archived and is no longer updated by Apple.

While a RAID set is being initialized, rebuilt, repaired, or verified on Xserve RAID or Xserve RAID (SFP), RAID Admin may not be able to give timely status updates of the arrays and drives for that controller. Stale data will be displayed in RAID Admin until RAID Admin is able to refresh the information.

When disk activity decreases, regular status updates will resume.

Power Mac G4 Cube: Modem doesn‘t make sounds when connecting

It's normal if your Power Mac G4 Cube computer's modem doesn't make any sounds when connecting to the Internet with Mac OS X 10.3
This article has been archived and is no longer updated by Apple.
The computer's modem made sounds in Mac OS 9 when it connected to the Internet. In Mac OS X 10.3, it's normal if the modem doesn't make any sounds when connecting.

Even though you don't hear the connection, you can see its progress in these ways:

- Open the Internet Connect application when you make a connection. The status appears in the lower part of the window.
- You can also see the connection status in the menu bar. Open Internet Connect and click the option labeled ""Show status while connecting".

Published Date: Feb 20, 2012

Xserve G5: No boot and no video after power interruption

If an Xserve G5 appears to be on but you see no startup flash and no video, the server may need the power to be disconnected for a few seconds.
This article has been archived and is no longer updated by Apple.

Symptom

After a brief power interruption, the server's fans are spinning and the power indicator shows the server is on, but you don't see any video and didn't see the startup flash from the indicator LEDs.

Solution

1. Disconnect the Xserve's power cable.
2. Wait 10 seconds.
3. Reconnect the power cable and turn the server on.

This symptom does not indicate an issue with the server and does not require hardware repair. The Xserve's power management architecture requires 5 to 10 seconds to reset.

Published Date: Feb 20, 2012

Xserve G5: No network connection with Ethernet cable only in upper port

Use the lower built-in Ethernet port of an Xserve G5 before you use the upper built-in Ethernet port.
This article has been archived and is no longer updated by Apple.

Symptom

With the Ethernet cable attached to the upper built-in Ethernet port, the Xserve G5 does not establish a network connection. For example, Startup Disk preferences shows no NetBoot volume.

Products affected

- Xserve G5

Solution

Move the Ethernet cable from the upper built-in Ethernet port to the lower built-in Ethernet port.

The architecture of the Xserve G5 requires the lower Ethernet port to be connected to the network before the upper Ethernet port is used. This is not an issue if an optional Ethernet PCI card is used.

This symptom does not indicate an issue with the server and does not require hardware repair.

Xserve G5: Power consumption and thermal output (BTU) information

Learn power consumption and thermal output information for Xserve G5.
This article has been archived and is no longer updated by Apple.

Xserve G5 (single processor)
"Minimum" configuration: Single 2.0 GHz G5 Processor, single 80 GB Apple Drive Module, 512 MB ECC RAM (2x256 MB DIMMs), no PCI cards

Power Consumption		Thermal Output	
Idle	**CPU Max**	**Idle**	**CPU Max**
130 W	170 W	444 BTU/h	580 BTU/h

Xserve G5 (single processor)
"Maximum" configuration: Single 2.0 GHz G5 Processor, three 250 GB Apple Drive Modules, 8 GB ECC RAM (8x1 GB DIMMs), no PCI cards

Power Consumption			Thermal Output		
Idle	**CPU Max**	**CPU+Disk Max**	**Idle**	**CPU Max**	**CPU+Disk Max**
155 W	200 W	210 W	529 BTU/h	683 BTU/h	717 BTU/h

Xserve G5 (dual processor)
"Minimum" configuration: Dual 2.0 GHz G5 Processors, single 80 GB Apple Drive Module, 1 GB ECC RAM (2x512 MB DIMMs), no PCI cards

Power Consumption		Thermal Output	
Idle	**CPU Max**	**Idle**	**CPU Max**
160 W	240 W	546 BTU/h	819 BTU/h

Xserve G5 (dual processor)
"Maximum" configuration: Dual 2.0 GHz G5 Processors, three 250 GB Apple Drive Modules, 8 GB ECC RAM (8x1 GB DIMMs), no PCI cards

Power Consumption			Thermal Output		
Idle	**CPU Max**	**CPU+Disk Max**	**Idle**	**CPU Max**	**CPU+Disk Max**
190 W	280 W	290 W	649 BTU/h	956 BTU/h	990 BTU/h

Xserve G5 (Cluster Node)
"Minimum" configuration: Dual 2.0 GHz G5 Processors, single 80 GB Apple Drive Module, 512 MB ECC RAM (2x256 MB DIMMs), no PCI cards

Power Consumption		Thermal Output	
Idle	**CPU Max**	**Idle**	**CPU Max**
155 W	240 W	528 BTU/h	819 BTU/h

Xserve G5 (Cluster Node)
"Maximum" configuration: Dual 2.0 GHz G5 Processors, single 80 GB Apple Drive Module, 8 GB ECC RAM (8x1 GB DIMMs), no PCI cards

Power Consumption		Thermal Output	
Idle	**CPU Max**	**Idle**	**CPU Max**
161 W	252 W	550 BTU/h	860 BTU/h

Notes

- Power consumption data (Watts) is measured from the wall power source and includes all power supply and system losses. Additional correction is not needed.
- "CPU Max" is defined as running a compute-intensive test application that maximizes processor usage and therefore power consumption.
- "Drive Max" is defined as running a test application that generates continuous input/output to a RAID set consisting of all internal disks in the system.
- These numbers reflect a 23° C (73.4° F) ambient running environment. Increased ambient temperatures will require faster fan speeds which will increase power consumption. At 35° C (95° F), 50 W should be added to reflect increased power consumption.
- These numbers reflect no PCI cards installed. A PCI video card will increase power consumption by 10 W.

Xserve RAID, Xserve RAID (SFP): Moving RAID sets

Learn important information about minimizing the risk of data loss when moving RAID sets.

This article has been archived and is no longer updated by Apple.

If, for any reason, you need to move one or more created RAID sets from one Xserve RAID to another or from one side of an Xserve RAID to the other, follow these steps to minimize the risk of data loss.

Warning: Only move RAID sets after following these instructions. These steps must be performed on both the source and target RAIDs.

1. Back up the data on the source Xserve RAID.
2. Number the drives in each RAID set to ensure the correct positioning when moved to the target RAID.
3. Inform any clients that the volumes will be unavailable for a period of time.
4. Unmount the volumes from any client computers.
5. Power off the Xserve RAIDs.
6. Remove the power cables from the back of the Xserve RAIDs (both source and target).
7. Move the drives to the new location, making sure the positioning corresponds with the numbers on the drives (see step 2).
8. When all drives are transferred, connect the power cord to the target Xserve RAID.
9. Power on the Xserve RAID.

About ECC memory errors

Learn about ECC memory and what to do if you experience ECC errors.

This article has been archived and is no longer updated by Apple.

Xserve G5 uses DDR400 (PC3200) unbuffered, unregistered ECC (Error Correction Code) memory. Xserve G5 is the first generation of Xserve that uses ECC memory and the Memory tab in Server Monitor now contains ECC-related information.

The version of Server Monitor that comes with Xserve G5 has an additional information field for each of the installed memory cards (DIMMs). This field denotes the number of single-bit (recoverable) ECC errors. If any of the DIMMs in the Memory tab's pop-up menu have a status indicator that is not colored green, this indicates that the DIMM has encountered ECC errors. Single-bit ECC errors are corrected by the ECC circuitry and cause no loss of data or system availability. A summation of the state of all DIMMs is shown in the main status line for a given server.

Server Monitor will also detect multiple-bit errors, but a multiple-bit error will cause a Mac OS X kernel panic. Information will be stored in the Server Monitor logs after the server is restarted. If this happens, you should replace the failing DIMM.

If you see more than four ECC errors in 48 hours, it may be a sign of an impending DIMM failure. Before replacing the DIMM, shut down the server and reseat the DIMM.

Often, a DIMM that is not fully seated will cause failures due to thermal effects on the DIMM connector. If the failures recur, the DIMM is probably about to fail and should be replaced at your earliest convenience.

Xserve RAID: No power

Learn about an issue that can cause an Xserve RAID not to start up properly.
This article has been archived and is no longer updated by Apple.

Symptom

The LEDs respond as follows:

- Power supply LEDs flash green as normal in Standby mode.
- The power on LED over the right power supply doesn't flash when ready to power on. It also does not start up the Xserve when you push it.
- The LEDs on the front of the Xserve RAID are all dark.

Products affected

- Xserve RAID
- Xserve RAID (SPF)

Solution

1. Open the CIP instructions for "Cables, Midplane Board-to-rear" and follow instructions 1 through 13 for removing the RAID from the rack and removing the top cover.
2. Locate the ribbon cable connected to the Rear Power Button Board, as seen in the lower right corner of this picture.

3. Reseat the ribbon cable at the Rear Power Button Board.

Xserve G5: "Display_ProbeForDevices" error appears in Xserve Remote Diagnostics 1.0

When you run Xserve Remote Diagnostics 1.0, you might see the message "Display_ProbeForDevices returned error -3." appear in the "Probing for hardware" section of the report.

This article has been archived and is no longer updated by Apple.

This does not indicate an issue with your Xserve G5. It simply means that the diagnostic software is looking for specific video cards and displays that are not present. The Xserve G5 may not have a certain video card or display the diagnostics expect to see, the Xserve G5 may be running "headless", or an unsupported video card or display may have been detected.

Published Date: Oct 11, 2016

Xserve G5: "Probing Network" error appears in Xserve Remote Diagnostics 1.0

When you run Xserve Remote Diagnostics 1.0, you might see the message "Probing Network returned error 2" appear in the "Probing for hardware" section of the report.

This article has been archived and is no longer updated by Apple.

This does not indicate an issue with your Xserve G5. It simply means the diagnostic software is looking for specific Ethernet controllers that are not included with the Xserve G5.

Published Date: Oct 11, 2016

Xserve G5: "CPU.G5.CPU Slot Number Verify" error appears in Xserve Remote Diagnostics 1.0

Learn what to do if you get a "CPU.G5.CPU Slot Number Verify" error when you run Xserve Remote Diagnostics.
This article has been archived and is no longer updated by Apple.
When you run Xserve Remote Diagnostics 1.0, you might see a message similar to this:

```
00:03:93:F5:1D:C8 03/30/04 12:11:15 Testing [00000005] CPU.G5.CPU Slot Number Verify
00:03:93:F5:1D:C8 03/30/04 12:11:15 CPU 0 Slot number is invalid!
00:03:93:F5:1D:C8 03/30/04 12:11:15 FAILED, result:7 "CPU Slot Number Verify failed
```

This does not indicate an issue with your Xserve G5.

This alert is caused by a reporting issue in the software.

You can either ignore the "failure" or turn off the "CPU.G5.CPU Slot Number Verify" test by following these steps:

1. Optionally, start by making a backup copy of the test definition file that you will be modifying. Two files have the same test - **quick.tdf** and **extended.tdf**. Copies of these files are found in ~/Library/Application Support/xrdiags/.
2. Using a text editor such as TextEdit, open either or both of the test definition files mentioned in step 1 (quick.tdf and extended.tdf).
3. Navigate to the line of the file that looks like the following:

   In quick.tdf:

   ```
   TEST    1       FALSE   "CPU.G5"        QUICK   OF      SA      3
   [commodity-type='CPU_',model="970+"]    "CPU Slot Number Verify"
   "Verify the CPU slot number in the cpuid rom and the physical MLB slot match and is valid."     ""      ""      ""
   ```

   In extended.tdf:

   ```
   TEST    1       FALSE   "CPU.G5"        EXTENDED   OF      SA      3
   [commodity-type='CPU_',model="970+"]    "CPU Slot Number Verify"
   "Verify the CPU slot number in the cpuid rom and the physical MLB slot match
   and is valid."     ""      ""      ""
   ```

4. Either delete the line in its entirety, or simply add a hash mark (#) to the beginning of the line, to comment the line out. For example:

   ```
   #TEST    1       FALSE   "CPU.G5"        QUICK   OF      SA      3
   [commodity-type='CPU_',model="970+"]    "CPU Slot Number Verify"
   "Verify the CPU slot number in the cpuid rom and the physical MLB slot match and is valid."     ""      ""      ""
   ```

5. Save changes and close the document. That step will no longer be included the next time Xserve Remote Diagnostics are run.

This document will be updated when more information becomes available.

Xserve G5: Adding a video card

Xserve G5's default configuration does not have a video card. Learn what your options are if you did not order the Xserve G5 with a video card, but want one later.

This article has been archived and is no longer updated by Apple.

The default configuration of the Xserve G5 does not include a video card. To receive a video card with your Xserve G5, add it to the configuration on the Apple Store when you order the Xserve.

If you already have the Xserve G5 and you want to add a video card, contact a third-party vendor. Apple does not offer the video card as a separate retail kit.

Video distortion when using 3D graphics on iBook G4 (Early 2004)

This article has been archived and is no longer updated by Apple.

Some iBook G4 (Early 2004) computers may show visible distortions or color shifts in moving patches of the screen while running 3D-intensive applications or games.

If this happens, your computer does not need service. Just update your computer using the iBook G4 Graphics Update. This should resolve the issue.

Disk Utility: Error -9977 when setting up hard drives as members of an AppleRAID set

Learn about the error -9977 when creating an AppleRAID set, and a workaround to avoid the issue.

This article has been archived and is no longer updated by Apple.

Symptom

An error -9977 may appear when using Disk Utility or diskutil to set up hard drives as part of an AppleRAID set.

Products affected

- Any system with multiple hard drives attached
- Disk Utility or diskutil

Solution

1. Erase the individual volumes before creating the RAID set.

   Warning: Always back up data you wish to keep before initializing a hard disk. Initialization erases all data on the hard disk.

2. After erasing the volumes, the new file system can be successfully created and mounted.

When this issue occurs, the RAID set may appear to have been created and to be valid, but the file system is not valid. The file system is reported as ISO 9660.

Tip: If you are adding a drive to be rebuilt into a degraded mirrored RAID set and the replacement drive used to be part of the same or another RAID set, it must be erased before it can be added to the mirrored RAID set.

Identifying 5400 RPM hard drives in PowerBook G4 computers

Some PowerBook G4 computers were ordered configured with an optional 80 GB 5400 RPM hard drive, instead of the default 4200 RPM hard drive. To identify your computer's hard drive speed, follow these steps.

This article has been archived and is no longer updated by Apple.

For Mac OS X 10.3

1. Click the Finder icon in the Dock.
2. From the **Go** menu, choose **Utilities**.
3. Open System Profiler.
4. In the Contents list, click ATA under the Hardware heading, as shown here.

5. In the ATA Device Tree window, click ATA-6 Bus.
6. In the ATA-6 Bus field, look at the Model line. Check to see if the drive's model number is listed here. If so, your computer has the 5400 RPM drive.

5400 RPM hard drives:

- HGST - HTS548080M9AT00
- Toshiba - MK8026GAX

Mac OS X Server: Software serial number not accepted

If you are entering your Mac OS X Server serial number and you see a message that says the serial number is not accepted or not recognized, make sure you are entering "`ick`", not "`lck`".

This article has been archived and is no longer updated by Apple.

A common cause for this alert is misreading the letter "i" as "L" in the serial number.

Published Date: Feb 19, 2012

Xserve Remote Diagnostics 1.0 displays IP of DHCP server

In some situations, Xserve Remote Diagnostics may show the IP address of the DHCP server, rather than the IP address of the computer hosting the diagnostic software.
This article has been archived and is no longer updated by Apple.

Symptom

On an admin computer running Xserve Remote Diagnostics 1.0, whenever any Xserve G5 connects to the admin computer to be diagnosed, information is displayed on the Xserve G5 about the specific NetBoot server from which the diagnostics software was loaded. For example, the line may look like this:

```
00:03:93:F5:1D:28 04/06/04 14:43:55 Booted from: 17.254.0.91
```

However, if the remote Xserve G5 is commanded into diagnostics mode from the admin computer, the information displayed about the specific NetBoot server that is hosting the diagnostics may show the DHCP server's IP address rather than the NetBoot server's IP address.

Products affected

- Xserve G5
- Xserve Remote Diagnostics v 1.0

Solution

This incorrect information does not indicate a problem with your Xserve G5, computer or network.

This document will be updated as more information becomes available.
Published Date: Feb 20, 2012

Resetting the Xserve G5 PMU

Here you can learn how to reset PMU in an Xserve G5.
This article has been archived and is no longer updated by Apple.

What is the PMU?

The PMU (Power Management Unit) is a microcontroller chip that controls all power functions for the server. The PMU is essentially a computer within a computer. Its function is to:

- tell the server to turn on, turn off, sleep, wake, idle, and so forth.
- manage system resets from various commands.

How to reset the PMU

Warning: Be very careful when handling the logic board. The PMU is very sensitive and touching the circuitry on the logic board can cause the PMU to crash. If the PMU crashes and is not reset, the battery life is significantly diminished. Many system issues can be resolved by resetting the PMU chip. When you have a server that fails to power up and software issues have been eliminated as a possible cause, follow these steps before replacing any modules.

1. Disconnect the power cord and check the battery in the battery holder. The battery should read between 3.3 and 3.7 Volts. If the battery measures outside of this range: replace it, wait ten seconds, and then proceed to step 2. If the battery voltage measures within this range: go directly to step 2.
2. Press and release the PMU reset button once and then proceed to step 3. Do not press the PMU reset button a second time, as it could crash the PMU chip.

3. Wait ten seconds before connecting the power cord and powering on the server. If the server powers on, go to step 4. If the server does not power on, there is something else wrong with the server. Verify the voltage on the power supply.
4. Run Xserve Remote Diagnostics to verify the system.

The procedure outlined above resets the server's real-time clock (RTC). After resetting the PMU, be sure to reset the server's time and date.

Don‘t put USB 1.1 and USB 2.0 hubs in the same chain

Some USB devices don't work when connected through a mixture of USB 2.0 hubs (high-speed) and USB 1.1 hubs (full- or low-speed).

This article has been archived and is no longer updated by Apple.

An external hard drive may not mount, for example, or printing may stop in the middle of a job or not print at all.

If you experience this issue, change the configuration of the USB chain so that you are not mixing speeds. Connect a high-speed hub directly to the computer, and connect high-speed devices to it. Do the same for your full-speed/low-speed hub and devices.

If you have to chain hubs, be sure to chain only hubs of the same type. Note, for example, that USB keyboards with built-in hubs (such as the Apple Pro Keyboard) are full-speed/low-speed hubs. So for best performance the keyboard should be plugged directly into the computer or into another full-speed/low-speed hub.

To determine which type of hub you have, open System Profiler from the Applications folder. When you plug the device in, it will appear in the Devices & Volumes section with information about the speed of the device.

PowerBook G4 audio line in port requires a powered signal

The PowerBook G4 audio line in port takes signals from audio equipment, including line-level devices such as amplified or self-powered microphones, and is specifically designed for high-level audio signal such as the signal from a powered microphone.
This article has been archived and is no longer updated by Apple.
If you use a nonpowered microphone with the audio line in port, it will result in a very low volume signal, or possibly no signal at all.

Third-party options, such as Griffin Technology's iMic, allow the use of many mic-level sound input devices with your computer.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Xserve G5: Won‘t start up, power light flashes once

Learn what it means if the power light flashes once when you try to start up your server. You can also learn about when the power light flashes two, three, or four times.
This article has been archived and is no longer updated by Apple.

Symptom

The server does not start up; the power light flashes once when you try to start the server. The flash repeats every 5 seconds.

Products affected

- Xserve G5

Solution

When the power light flashes once, this means that the server doesn't recognize any installed RAM, or that no RAM is installed.

Install memory

If no SDRAM is installed, install the appropriate memory:

Server	SDRAM type
Xserve G5	PC3200 DDR

Check the installed memory

1. Check that the memory is installed in pairs, as described in the User's Guide.
2. Remove the RAM, firmly reinsert it, and try starting the server again.
3. Try removing the memory in pairs and testing again, to isolate any possible bad DIMMs.
4. If all DIMMs are known good memory and the issue still occurs, the logic board may need to be replaced.

Note: When installing the replacement logic board, make sure the ports and ID button on the back of the board align with the opening in the chassis.
Published Date: Oct 11, 2016

Xserve G5: Won‘t start up, power light flashes twice

Learn what it means if the power light flashes twice when you try to start up your server.
This article has been archived and is no longer updated by Apple.

Symptom

The server does not start up; the power light flashes twice when you try to start the server. The flashes repeat every 5 seconds.

Products affected

- Xserve G5

Solution

When the power light flashes twice, this means that incompatible RAM is probably installed.

Install memory

Install the correct memory:

Server	SDRAM type
Xserve G5	PC3200 DDR

Check the installed memory

1. Check that the memory is installed in pairs, as described in the User's Guide.
2. Try removing the memory in pairs and testing again, to isolate any possible bad DIMMs.
3. If all DIMMs are known good memory and the issue still occurs, the logic board may need to be replaced.

Note: When installing the replacement logic board, make sure the ports and ID button on the back of the board align with the opening in the chassis.

Published Date: Oct 11, 2016

Xserve G5: Won‘t start up, power light flashes three times

Learn what it means if the power light flashes three times when you try to start up your server.
This article has been archived and is no longer updated by Apple.

Symptom

The server does not start up; the power light flashes three times when you try to start the server. The flashes are repeated every five seconds.

Solution

When the power light flashes three times, this means that none of the RAM banks passed memory testing.

Install memory

Install the appropriate memory:

Server	SDRAM type
Xserve G5	PC3200 DDR

Check the installed memory

1. Check that the memory is installed in pairs, as described in the User's Guide.
2. Try removing the memory in pairs and testing again, to isolate any possible bad DIMMs.
3. If all DIMMs are known good memory and the issue still occurs, the logic board may need to be replaced.

Note: When installing the replacement logic board, make sure the ports and ID button on the back of the board align with the opening in the chassis.

Xserve G5: Won‘t start up, power light flashes four times

Learn what it means if the power light flashes four times when you try to start up your server.
This article has been archived and is no longer updated by Apple.

Symptom

The server does not start up; the power light flashes four times when you try to start the server. The flashes repeat every 5 seconds.

Products affected

- Xserve G5

Solution

When the power light flashes four times, this means that the server's ROM may be bad.

Try each of these steps in order, testing in between steps to see if the server starts:

1. Remove the processor module and reinsert it securely.
2. Replace the processor module.
3. Replace the logic board.

Note: When installing the replacement logic board, make sure the ports and ID button on the back of the board align with the opening in the chassis.

How to use Forward Delete on an iBook or PowerBook

Have you ever needed a Forward Delete key as well as a normal Delete key? Extended keyboards include such a key, and you can get the same behavior from your iBook or PowerBook keyboard.

This article has been archived and is no longer updated by Apple.

While PowerBook and iBook computers do not have a unique Forward Delete key, you can delete the character to the right of your cursor by pressing fn-Delete (function-Delete).

Computers with a fn (function) key include the PowerBook G3 Series, PowerBook (FireWire), all PowerBook G4 models and all iBook models.

Power Mac G5 (June 2004), (Late 2004): Power consumption and thermal output (BTU) information

Learn power consumption and thermal output information for Power Mac G5 (June 2004) and Power Mac G5 (Late 2004) computers.
This article has been archived and is no longer updated by Apple.
Standard Configurations of Power Mac G5 (June 2004):

Dual 1.8GHz PowerPC G5
900 MHz frontside bus/processor
512K L2 cache/processor
256 MB DDR400 SDRAM, expandable to 4GB SDRAM
80GB Serial ATA drive
8x SuperDrive
3 PCI slots
NVIDIA GeForce FX 5200 Ultra
64MB DDR video memory
56K internal modem

Dual 2.0GHz PowerPC G5
1 GHz frontside bus/processor
512K L2 cache/processor
512 MB DDR400 SDRAM, expandable to 8GB SDRAM
160GB Serial ATA drive
8x SuperDrive
3 PCI-X slots
NVIDIA GeForce FX 5200 Ultra
64MB DDR video memory
56K internal modem

Dual 2.5GHz PowerPC G5
1.25 GHz frontside bus/processor
512K L2 cache/processor
512 MB DDR400 SDRAM, expandable to 8GB SDRAM
160GB Serial ATA drive
8x SuperDrive
3 PCI-X slots
ATI Radeon 9600 XT
128MB DDR video memory
56K internal modem

All configurations of Power Mac G5 (June 2004)

Power Consumption			Thermal Output		
Idle	**Max**	**Fully Loaded Max**	**Idle**	**Max**	**Fully Loaded Max**
120 W	406 W	604 W	410 BTU/h	1386 BTU/h	2060 BTU/h

Standard Configuration of Power Mac G5 (Late 2004):

Single 1.8GHz PowerPC G5
600 MHz frontside bus
512K L2 cache
256 MB DDR400 SDRAM, expandable to 4GB SDRAM
80GB Serial ATA drive
8x SuperDrive
3 PCI slots
NVIDIA GeForce FX 5200 Ultra
64MB DDR video memory
56K internal modem

Power Mac G5 (Late 2004)

Power Consumption			Thermal Output		
Idle	**Max**	**Fully Loaded Max**	**Idle**	**Max**	**Fully Loaded Max**
120 W	160 W	552 W	409 BTU/h	545 BTU/h	1882 BTU/h

- Max is the maximum that can be expected with the default configurations listed above.

- Fully Loaded Max is the maximum that can be expected when the computer is fully loaded with PCI cards, memory, and hard drives.
- Power numbers are input power to the AC, not output power. These numbers were derived from these considerations:
  240 W for processor and DC-DC
  10 W for optical drive
  15 W for hard drive
  25 W for graphics card
  20 W for main logic board
  80% efficiency

Apple Cinema Display (20-inch DVI), Apple Cinema HD Display (23-inch DVI), Apple Cinema HD Display (30-inch DVI): Update to Mac OS X 10.3.5 for full feature selection

Are you having trouble finding the Options tab in Displays preferences?
This article has been archived and is no longer updated by Apple.
If you can't find the Options tab, you may need to open Software Update and update your computer to Mac OS X 10.3.5 or later.

The displays work without the Mac OS X 10.3.5 update. Installing the update simply enables additional features.

Published Date: Oct 11, 2016

Installing the VESA mount on an Apple Cinema Display (20-inch DVI), Apple Cinema HD Display (23-inch DVI), or Apple Cinema HD Display (30-inch DVI)

There's an optional VESA mount adapter available for the Apple Cinema Display (20-inch DVI), Apple Cinema HD Display (23-inch DVI), and Apple Cinema HD Display (30-inch DVI).

This article has been archived and is no longer updated by Apple.

The VESA mount adapter allows compatible displays to be used with a variety of alternate mounting solutions, such as wall mounts and zero-footprint articulating arms based on the VESA flat panel mounting interface (FPMI). Instructions and a hex tool for removing the desktop stand provided with the display are provided with the adapter. You can also get the installation instructions here.

The Apple flat-panel display with the VESA mount adapter uses a 100 mm mounting surface and, when attached, complies with the VESA MIS-D, 100, C version of the specification.

Processor speeds and bus speeds of Macintosh computers

Learn the bus speeds for each model of Macintosh computer from the Power Macintosh G3 and later. (For computers manufactured earlier than seven years ago, see document 17121.

This article has been archived and is no longer updated by Apple.

The table below contains the name, processor speed, and bus speed for each Macintosh computer manufactured in the last seven years.

Computer	Processor Speed	Bus Speed
Power Macintosh G3		
Power Macintosh G3 Mini Tower	233 MHz, 300 MHz	66 MHz
Power Macintosh G3 Desktop	233 MHz, 300 MHz	66 MHz
Power Macintosh G3 All-in-One	233 MHz, 266 MHz	66 MHz
Power Macintosh G3 (Blue and White)	350 MHz, 400 MHz, 450 MHz	100 MHz
Power Mac G4		
Power Mac G4 (PCI Graphics)	350 MHz, 400 MHz	100 MHz
Power Mac G4 (AGP Graphics)	350 MHz, 400 MHz, 450 MHz, 500 MHz	100 MHz
Power Mac G4 Cube	450 MHz	100 MHz
Power Mac G4 (Gigabit Ethernet)	400 MHz, dual 450 MHz, dual 500 MHz	100 MHz
Power Mac G4 (Digital Audio)	466 MHz, 533 MHz, dual 533 MHz, 733 MHz	133 MHz
Power Mac G4 (QuickSilver)	733 MHz, 867 MHz, dual 800 MHz	133 MHz
Power Mac G4 (QuickSilver 2002)	800 MHz, 933 MHz, dual 1 GHz	133 MHz
Power Mac G4 (Mirrored Drive Doors)	dual 867 MHz, dual 1 GHz, dual 1.25 GHz	133 MHz (dual 867 MHz) or 167 MHz
Power Mac G4 (FW 800)	1 GHz, dual 1.25 GHz, dual 1.42 GHz	133 (1 GHz) or 167 MHz
Power Mac G4 (Mirrored Drive Doors 2003)	1.25 GHz, dual 1.25 GHz	167 MHz
Power Mac G5		
Power Mac G5	1.6 GHz, 1.8 GHz, dual 2.0 GHz	800 MHz, 900 MHz, or 1 GHz per processor
Power Mac G5 (June 2004)	dual 1.8 GHz, dual 2.0 GHz, dual 2.5 GHz	900 MHz, 1 GHz, or 1.25 GHz per processor
Power Mac G5 (Late 2004)	1.8 GHz	600 MHz
Power Mac G5 (Early 2005)	dual 2.0 GHz, dual 2.3 GHz, dual 2.7 GHz	1 GHz, 1.15 GHz, or 1.35 GHz per processor
Mac mini (with G4 processor)		
Mac mini	1.25 GHz, 1.42 GHz	167 MHz
iMac (with G3 processor)		
iMac 233 MHz	233 MHz	66 MHz
iMac 266 MHz	266 MHz	66 MHz
iMac 333 MHz (Five Flavors)	333 MHz	66 MHz
iMac (Slot Loading)	350 MHz, 400 MHz	100 MHz
iMac (Summer 2000)	350 MHz, 400 MHz, 450 MHz, 500 MHz	100 MHz
iMac (Early 2001)	400 MHz, 500 MHz, 600 MHz	100 MHz

iMac (Summer 2001)	500 MHz, 600 MHz, 700 MHz	100 MHz
iMac (with G4 processor)		
iMac (Flat Panel)	700 MHz, 800 MHz	100 MHz
iMac (17-inch Flat Panel)	800 MHz	100 MHz
iMac (17-inch 1GHz)	1 GHz	133 MHz
iMac (USB 2.0)	1 GHz, 1.25 GHz	167 MHz
iMac (with G5 processor)		
iMac G5	1.6 GHz, 1.8 GHz	533 MHz, 600 MHz
eMac (with G4 processor)		
eMac	700 MHz, 800 MHz	100 MHz
eMac (ATI Graphics)	800 MHz, 1 GHz	133 MHz
eMac (USB 2.0)	1.25 GHz	167 MHz
PowerBook G3		
PowerBook G3	250 MHz	50 MHz
PowerBook G3 Series	233 MHz, 292 MHz	66 MHz or 83 MHz
PowerBook G3 Series (Bronze Keyboard)	333 MHz, 400 MHz	66 MHz
PowerBook (FireWire)	400 MHz, 500 MHz	100 MHz
PowerBook G4		
PowerBook G4	400 MHz, 500 MHz	100 MHz
PowerBook G4 (Gigabit Ethernet)	550 MHz, 667 MHz	100 MHz or 133 MHz
PowerBook G4 (DVI)	667 MHz, 800 MHz	133 MHz
PowerBook G4 (1 GHz/867 MHz)	867 MHz, 1 GHz	133 MHz
PowerBook G4 (15-inch FW 800)	1 GHz, 1.25 GHz	167 MHz
PowerBook G4 (15-inch 1.5/1.33GHz)	1.33 GHz, 1.5 GHz	167 MHz
PowerBook G4 (12-inch)	867 MHz	133 MHz
PowerBook G4 (12-inch DVI)	1 GHz	133 MHz
PowerBook G4 (12-inch 1.33GHz)	1.33 GHz	167 MHz
PowerBook G4 (17-inch)	1 GHz	167 MHz
PowerBook G4 (17-inch 1.33GHz)	1.33 GHz	167 MHz
PowerBook G4 (17-inch 1.5GHz)	1.5 GHz	167 MHz
iBook G3		
iBook	300 MHz, 366 MHz	66 MHz
iBook (FireWire)	366 MHz, 466 MHz	66 MHz
iBook (Dual USB)	500 MHz	66 MHz
iBook (Late 2001)	500 MHz, 600 MHz	66 MHz or 100 MHz
iBook (14.1 LCD)	600 MHz	100 MHz
iBook (16 VRAM)	600 MHz, 700 MHz	100 MHz
iBook (14.1 LCD 16 VRAM)	700 MHz	100 MHz
iBook (Opaque 16 VRAM)	700 MHz	100 MHz
iBook (32 VRAM)	800 MHz	100 MHz
iBook (14.1 LCD 32 VRAM)	800 MHz	100 MHz
iBook (Early 2003)	800 MHz, 900 MHz	100 MHz
iBook G4		
iBook G4	800 MHz	133 MHz
iBook G4 (14-inch)	933 MHz, 1 GHz	133 MHz
iBook G4 (Early 2004)	1 GHz	133 MHz
iBook G4 (14-inch Early 2004)	1 GHz, 1.2 GHz	133 MHz

iBook G4 (12-inch Late 2004)	1.2 GHz	133 MHz
iBook G4 (14-inch Late 2004)	1.33 GHz	133 MHz

Apple Hardware Test gives "2CPU/10/9 CPU0" or similar alert on Power Mac G5 (June 2004)

Have you gotten an alert that says "2CPU/10/9 CPU0" or something similar when running Apple Hardware Test? Learn why you may not need to worry about it.

This article has been archived and is no longer updated by Apple.

If you run Apple Hardware Test version 2.2.2 or earlier on a Power Mac G5 (June 2004) computer with either dual 1.8 GHz G5 microprocessors or dual 2.0 GHz G5 microprocessors, you may see an alert like the one above. It might be slightly different - the digit shown as 9 above may be a different number, or "CPU0" may be "CPU1".

If you see this alert, ignore it. A newer version of Apple Hardware Test, version 2.2.4, is expected to fix this and is expected to be made available soon. This article will be updated with more information as soon as the new version is available.

Xserve G5: Verifying compatibility and installing Hardware RAID PCI card

An Xserve G5 must meet minimum software requirements for the Hardware RAID PCI card to work properly. Follow the steps below to help ensure that data is not inadvertently deleted.
This article has been archived and is no longer updated by Apple.
This procedure also provides support for booting from volumes attached to the Hardware RAID PCI card.

1. Update to BootROM 5.1.7f1, available here. It is essential to update the Xserve G5 from the BootROM version 5.1.6f3 it shipped with.
2. Update your Xserve G5 to Mac OS X Server 10.3.5, available here.
3. Back up all the data on all drives. Installing the Hardware RAID PCI card requires you to erase the data on all three disks. For example, use Disk Utility to move data from the internal disks to an image on external media, or use a third-party backup utility to maintain permissions while transferring the data. The key to successfully backing up a volume is to maintain these permissions.
4. Create a method for booting your server that does not involve the three internal drives. This can be done by installing Mac OS X 10.3.5 on an external FireWire drive, SCSI drive, or using a NetBoot image.
5. Install the card using the instructions enclosed with the card.
6. Boot the server and verify the card and drives are connected correctly by typing the following commands in the Terminal application:

   ```
   megaraid -showadapter
   ```

   ```
   megaraid -showdevices
   ```

   If your card does not appear, type the following command:

   ```
   sudo touch /System/Library/Extensions
   ```

   Then restart your Xserve.

   Important: Your old drive partitions may now appear, but the partitions are no longer valid since the drive geometry has changed. Do NOT use your previously formatted drive partitions attached to your newly installed Harware RAID PCI card. You must reformat your drives before you can use the drives.

   This is important because the Hardware RAID card uses the space on the drive differently than the original formatting of the drive, which will result in the following:

   - The logical size of the drive will be different when used by the Hardware RAID card, and it is possible that some filesystem data structures or other data may be lost.
   - The partition map will become no longer valid such that Disk Utility will report problems and HFS+ journals will not be able to be replayed.
7. Type the terminal command:

   ```
   megaraid -destroyconfig
   ```

   This will erase the Hardware RAID PCI card metadata and the metadata stored on the drives.
8. Create your RAID set with the following command:

   `megaraid -create` [and your options]
9. Restore your boot drive and data.

About the iMac G5 Sound Output port

Learn about the Sound Output port of your iMac G5.

This article has been archived and is no longer updated by Apple.

The iMac G5 can use the following connectors for sound output through the Headphone Out/Optical Audio Out port located on the right side of the back of the computer:

- 3.5mm metal analog mini-jack
- 3.5mm plastic optical mini-jack to Toslink cable

These cables are available from the Apple Store.

Note: If you connect or disconnect the audio cable while sound is playing, there may be a delay transferring the sound to the new destination speakers. If you are playing a QuickTime movie while doing so, you may need to pause and restart your movie to ensure proper sync between audio and video.

iMac G5: Loose power cord could cause power loss

This article has been archived and is no longer updated by Apple.

To avoid a sudden loss of power, be sure that the power cord is fully inserted into the power cord receptacle on the back of your iMac G5. Loss of power occurs most often when you reposition the iMac, or if the power cord gets tugged. The ring on the power cord should sit flush with the back of the iMac case. Also be sure that the power cord isn't tangled with other cables or objects.

The pictures below show a correctly installed power cord and an incorrectly installed power cord.

Correctly-seated power cord

Improperly-seated power cord

If your iMac continues to experience a sudden loss of power and shuts down unexpectedly, try removing the cosmetic trim ring attached to the end of the power cord. The trim ring is circular and can be removed easily by holding the power cord as shown below, while gently pulling the trim ring away from the power connector. Once the trim ring works free, slide it down the power cord where it will be out of the way. The power cord trim ring is not necessary for iMac operation.

Mac OS X: Video distortion when scrolling through windows

This article has been archived and is no longer updated by Apple.

When you scroll through some application windows in Mac OS X, the contents in the window may become slightly distorted. This can occur when using certain ATI video cards.

The distortion can be described as ripples, waves, visual tears, or horizontal lines, and the distortion location and intensity can change, depending on the size of the window and the speed at which you scroll. The distortion only appears inside of a window—never outside—and it disappears when you stop scrolling.

Important: This does not indicate a hardware issue that requires repair, nor is software troubleshooting necessary.

Why does this happen?

Safari, some games, and some multimedia applications that display animated content may turn off "coalesced updates" to improve performance. This can lead to the visual symptoms described above. Coalesced updates that are designed to eliminate visual "tearing" or other display artifacts can reduce display performance.

This document will be updated as more information becomes available.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Apple System Profiler: Reports Slow Memory

This article describes a situation where Apple System Profiler reports slow memory in computers with multiple PC-100 RAM modules.
This article has been archived and is no longer updated by Apple.

Symptom

When two SO-DIMM modules with different CAS Latency values are installed, Apple System Profiler reports that one of the SO-DIMMs installed is slow.

Affected Products

- All Apple products with PC-100 or PC-133 RAM (PowerBook G3 (FireWire), Power Mac G4)

Solution:

Apple System Profiler identifies the RAM as either PC-100-222S, or PC-100-322S. These memory modules meet Apple's memory specification for PC-100 memory. The PC-100-322S has a CAS latency rating of 3 rather than 2. This will not impact the performance of the computer.

If Apple System Profile identifies the RAM as PC-100-333S, it is actually PC-66 memory or an earlier form of PC-100 memory that is not qualified for use in the PowerBook (Firewire).

Note: If both memory modules are the same speed, it is only reported once.

Future revisions of Apple System Profiler will not report slow memory if both memory modules meet the memory specification for Apple computers.

AppleShare IP 6: Mail Service FAQ Part 2

This document contains frequently asked questions (FAQ) regarding AppleShare IP 6 Mail Service, with answers to those questions.

For the first part of this FAQ, see technical document 24568: "**AppleShare IP 6: Mail Service FAQ Part 1"**

This article has been archived and is no longer updated by Apple.

Questions answered in this document:

1. Why do users get warning messages when mail has been delayed?
2. What is the size limit of enclosures the Mail Server can handle?
3. How can I troubleshoot mail delivery issues?
4. What do I do when the Mail Server cannot startup due to a database error?
5. Can I use the ASIP Mail Tool while the Mail Server is running?
6. How do you set up a mail server on a separate server using only one serial number?
7. Does installing the mail portion of ASIP on a separate computer turn off Mac OS File Sharing (ie Personal File Sharing)?
8. How do I setup a connection to my ISP to retrieve mail if I have an intermittent connection?
9. What else can I do if I have an intermittent connection?
10. Why does the Mail Server make connections to the external network outside the designated schedule?

Question 1: Why do users get warning messages when mail has been delayed?

Answer: The mail server will send an email warning to the sender whenever a mail message has gone undelivered on the server for a default value of 4 hours. The amount of time before the warning is sent can be adjusted in the "Mail Server Settings"; "Mail Out" panel. This feature can also be turned off. When users receive the warning message they do not need to resend the original message.

Question 2: What is the size limit of enclosures the Mail Server can handle?

Answer: The AppleShare IP 6 Mail Server does not limit the file size it sends or receives by default. If you would like to place a limit on the maximum messages size go into the "Mail Server Settings" ; "Mail In" panel and click the checkbox for "Maximum Message size", then set your value. All messages that are sent to the server that are over this size limit are then refused.

Question 3: How can I troubleshoot mail delivery issues?

Answer: Confirm that your network's router or internet gateway allows incoming and/or outgoing SMTP mail delivery. Make sure that your DNS is available and that your MX-records or aliases are setup correctly for your host name. Look at the server and error logs for messages which might indicate what the issue is.

Question 4: What do I do when the Mail Server cannot startup due to a database error?

Answer: Restore your mail database from a backup, or run the ASIP Mail Tool to verify the contents of the database. The database may become unusable if the computer stops responding or from a power loss.

Question 5: Can I use the ASIP Mail Tool while the Mail Server is running?

Answer: No. Both the mail server and mail admin need to be quit before running the ASIP Mail Tool.

Question 6: How do you set up a mail server on a separate server using only one serial number?

Answer: Create the user accounts on your primary ASIP server.

1. Enable mail for each user you wish to have an email account.
2. Create any groups you would like to use.
3. Once you have all your accounts ready, create a copy of your Users & Groups Data File making sure to keep the name of the file the same.
4. Place your copied Users & Groups Data file onto the new computer.
5. Install the Mail AND Web/File servers onto the new computer.
6. Reboot the computer with the shift key down to disable all extensions.
7. Place the Users & Groups Data File from the old computer into the Preferences folder of the new computer. This will overwrite the old file--that is OK.
8. Reboot the computer normally.
9. Open AppleShare Easy Setup and use the same serial number as the old computer.
10. Open Web & File Admin to verify that all your accounts are available with the correct mail settings.

Your new server is now ready to run the mail server, be sure to change any DNS settings to reflect the new IP address of the mail server. An

alternative to the above steps is to create an export user file from the old computer and import the users into the new computer. Information on importing and exporting users can be found in the Import/Export Users FAQ.

Question 7: Does installing the mail portion of ASIP on a separate computer turn off Mac OS File Sharing (ie Personal File Sharing)?

Answer: The separate mail server has to use the AppleShare IP Users & Groups file and registry. These items are not compatible with Personal File Sharing. Therefore, you cannot use Personal File Sharing on a standalone ASIP Mail server.

Question 8: How do I setup a connection to my ISP to retrieve mail if I have an intermittent connection?

Answer: You will need to activate and schedule Remote Mail Polling (ETRN) for the Host file of the ISP:

1. Verify with your ISP that they can support ETRN requests.

2. Ask your ISP to set themselves up as a "backup" mail server to your domain name of "company.com". They'll need to modify the MX-List for "company.com" but they should know what to do.

3. Ask the ISP for the name of the mail server which they have specified as a backup for your mail server, for the purposes of this example we'll call that mail server "mail.myisp.net"

4. Launch ASIP Mail Server & Mail Admin. After both are up and running bring up the host list window in Mail Admin.

5. In the host list window click on the "Create New Host" button. When the "name" dialog comes up, enter the name of your ISP's mail server from step #3 "mail.myisp.net".

6. When this entry shows up in the list, highlight it and click "Edit Host" button in the Host List window.

7. In the Edit hosts Window for the ISP mail server, click the "Schedule" Tab:

   - a) from the pop-up menu select "Set Allowed Connection Times".
   - b) setup a schedule of allowed connection times on the 7 day 24 hour panel. Green means allowed to connect at that time, grey means do not connect at that time.
   - c) click the "Remote Mail Polling (ETRN)" checkbox in the lower right hand corner.

Those are the major steps you have to take. The ASIP 6 Mail Server will now "poll" your ISP's mail server during allowed connection times and ask it to send any mail waiting for your domain name.

Question 9: What else can I do if I have an intermittent connection?

Answer:

- Forward all your outgoing mail via your ISP's SMTP mail server.
- Tell your AppleShare IP Mail Server its name for aliases or private IP networks (such as with the Vicom Gateway or other PPP dialup IP gateways).
- Set up a default schedule for all outgoing mail.

Forwarding all your remote mail through one SMTP mail server:

When running with a dialup connection, it is sometimes useful to have all your outgoing mail sent to one SMTP mail server, so that your AppleShare IP mail server doesn't waste time sending mail to various mail server's all over the internet (which may be down or unreachable at the time your server is connected). Forwarding all your mail to another SMTP mail server with a full time internet connection is a method of offloading mail delivery to another server which has the bandwidth and the time to complete the message delivery process.

1. Launch Mail Admin, with the ASIP Mail Server running
2. From the "Server Menu" choose "Mail Server Settings"
3. Click the "Mail Out" Tab.
4. Click the "Relay all SMTP mail via" check box
5. In the text field next to the check box enter the name of your ISP's mail server.
6. Click "Save" & close the window.

All outgoing mail will now be forwarded to the designated SMTP mail server to complete the delivery process. Setting this option has no effect on mail that is being delivered to your local users, it will only affect mail that has to be delivered to other mail servers.

Tell your AppleShare IP Mail Server its name for aliases or private IP networks (such as with the Vicom Gateway or other PPP

dialup IP gateways).

1. Launch Mail Admin, with the ASIP Mail Server running.
2. Determine the domain name(s) that your ISP has registered for your company or mail server. These are the name(s) other people will use to send you mail.
3. Open the Host List window in Mail Admin.
4. Click the "New Host" button in the Host List window.
5. Enter the name of your mail server from step two.
6. Select the host you just created when it appears in the list.
7. Click the "Edit Host" button.
8. Click the "Mail Out" tab.
9. Click the "Relay all SMTP mail via" check box.
10. Enter the private-IP address of your ASIP mail server in the text box.
11. Click "Save".
12. Repeat starting at step 4 for each additional name your want your mail server to "know about".

Setup a default schedule for all outgoing mail

1. Launch Mail Admin, with the ASIP Mail Server running.
2. Open the Host List window in Mail Admin.
3. From the "Server" menu choose "Edit Default Host Profile..."
4. Click each of the four tabs "Mail In", "Mail Out", "Schedule", and "Network".
5. Make sure all settings are the way you want them for all outgoing mail. In particular make sure to setup the schedule that you want mail to be sent with.
6. Click "Save".

Now whenever mail is sent by your users to any other internet mail server, the outgoing mail will "wait" until an allowed connection time to be sent. Using this in combination with the global server setting to relay all outgoing mail via one server is a powerful combination, which will hold all your outgoing mail until an allowed connection time, and then when a connection is allowed all the mail will be sent to one SMTP server all at once.

Note: Changing default settings does not modify the preferences or schedule for any host that already exists in the host list window. If you want these preexisting hosts to have the current default settings, then you must manually edit each of the hosts in the window. Or as a trick, if all the existing hosts have zero messages waiting to be sent, then you can simply delete them. When they get recreated by the mail server, they will get a new "copy" of the current default host settings with the appropriate schedule and preferences.

Question 10: Why does the Mail Server make connections to the external network outside the designated schedule?

Answer: The Mail Server may establish a connection outside a designated schedule if a DNS lookup is needed for a new host. This may occur if a DNS lookup has not happened in a long time. If you are using your ISP's DNS server and you are using a dial-up connection, when the mail server makes a DNS request it will bring up the connection to query the ISP's DNS server. You can prevent this from happening by:

- Setting up a DNS system on your local network
- Expand the time allowed to connect to the external network.

AppleShare IP 6: Web Service FAQ, Part 2

This article contains the following frequently asked questions (FAQ) about AppleShare IP 6 Web Service, with answers to those questions.

For the first part of this article, see

Article 24556: "**AppleShare IP 6: Web Service FAQ, Part 2"**

This article has been archived and is no longer updated by Apple.

Questions answered in this article:

1. Can you run additional HTTP applications on the same computer as the AppleShare IP Web Server, such as FileMaker Pro 4.0?
2. Can you run streaming video on the AppleShare IP Web Server?
3. How do you set secure administrator access to the Web Server for plug-in configuration?
4. How do you set MIME types for a plug-in?
5. Does AppleShare IP 6 provide remote administration support? I see a checkbox for it.
6. Does the AppleShare IP 6 web server work with alias resolution?
7. Under what condition(s) can the error log stop recording error conditions?
8. Can I upload files to the AppleShare IP 6 Web server?
9. How do I set the default web page for At Ease for use with the At Ease Web Plug-in?

Question 1: Can you run additional HTTP applications on the same computer as the AppleShare IP Web Server, such as FileMaker Pro 4.0?

Answer: Yes. Other HTTP apps use different web ports.

Question 2: Can you run streaming video on the AppleShare IP Web Server?

Answer: Yes. With Quicktime 3.0 installed (browser plugins), you can access and run .MOV files. This also requires that the client is running Quicktime 3.0.

Question 3: How do you set secure administrator access to the Web Server for plug-in configuration?

Answer: First, please check with your plug-in developer documentation for specific instructions for that plug-in. Basically the standard setup is as follows:

1. If you access and configure the plug-in by a URL such as "

```
http://yourserver.com/admin.xxxx
```

", create a folder at the Web Server root level.

2. In the Web & File Administration, select this folder.

3. Set the privileges for a registered user (admin).

4. When you access that URL location, you will be prompted for your username and password. Once you type in this information, you can proceed to configure the plug-in.

Question 4: How do you set MIME types for a plug-in?

Answer: Most of the time plug-ins register their own MIME types (which are viewable in the plug-in messages file or in LogDoor). If your plug-in uses a suffix like .XXXX, you can set it up under Server Menu's Web MIME option. First Create New Type; select "Execute..." action and select your plug-in in it's folder. Enter the suffix (such as .XXXX); file type and creator type can both be set to *. The MIME type can be text/html for standard web pages. Check the plug-in developer documentation for specific instructions for that plug-in.

Question 5: Does AppleShare IP 6 provide remote administration support? I see a checkbox for it.

Answer: At this time, remote web administration is not available.

Question 6: Does the AppleShare IP 6 web server work with alias resolution?

Answer: Yes. Place the alias in the directory for the web page that is referenced. You will need to place a link to the alias on your web page. If the alias resolves to an item in a secure folder, the client will have to provide a username and password in order to access that item.

Question 7: Under what condition(s) can the error log stop recording error conditions?

Answer: This can occur if you have run out of hard disk space.

Question 8: Can I upload files to the AppleShare IP 6 Web server?

Answer: Yes. You can edit files and then upload them to replace the same filename currently stored on the AppleShare IP 6 Web server. You will need to be a registered User on the Web server. The User must have read-write privileges set for the folder where the file resides. In addition, the Upload plug-in is required and is installed by the AppleShare IP installer. On the computer that has the files to be uploaded to the server, open a Web browser program and type the following in a browser's URL address box:

- To upload into current Web Folder:

  ```
  http://yourservername/.upload
  ```

- To upload into a specific directory:

  ```
  http://yourservername/folderA/.upload
  ```

  Note: Netsape Navigator only uploads the data fork of a file. Internet Explorer encodes all files using MacBinary and uploads both the data and resource forks.

Question 9: How do I set the default web page for At Ease for use with the At Ease Web Plug-in?

Answer: Follow the same instructions for selecting your default html page in the Web & File Admin program. The At Ease Web Plug-in requires QuickTime to be installed on the server. If QuickTime is not installed, a user may get this message when trying to visit your Web site:

404 Not Found No such object exists on this server.

/Plug-Ins/AtEaseWebPlugIn/ae.wae.

The At Ease Web Plug-in uses QuickTime to convert the PICT icons on documents to JPEGs before displaying them to the client.

AppleShare IP 6: AppleShare Client FAQ Part 2

This article contains the following frequently asked questions (FAQ) about the AppleShare Client software used with AppleShare IP 6, with answers to those questions.

For the first part of this article, see

Article 24558: **"AppleShare IP 6: AppleShare Client FAQ Part 1"**

This article has been archived and is no longer updated by Apple.

Questions answered in this article:

1. While connecting via TCP over PPP, I use AppleShare Client to connect to a server via Server IP Address, if I receive "Server not responding" message, what do you recommend I do?
2. Can I use a remote server alias from a Macintosh client to connect to my AppleShare IP 6 Server?
3. Since the AppleShare Client uses TCP/IP to connect to the Server, why can't I connect to my Sun, NT server, or whatever using TCP/IP?
4. Sometimes my computer stops responding when I log on via Chooser, select a volume from the volume list and click OK. Any workaround?
5. My alias to an AppleShare IP server volume will not work over TCP/IP. Why is that?
6. How can I make sure that my AppleShare Client computer connects to my server at startup using TCP/IP?
7. How does the AppleShare Client software decide to use AFP over TCP/IP when connecting to a server?
8. I can't log on to an AppleShare IP server while connected to a different AppleShare IP. I get an "Already Connected" dialog and the AppleShare client shows the first AppleShare IP server's volumes, not the new server's login dialog.
9. Is AppleShare Client 3.8 compatible with RunShare?

Question 1: While connecting via TCP over PPP, I use AppleShare Client to connect to a server via Server IP Address, if I receive "Server not responding" message, what do you recommend I do?

Answer: If you are receiving "Server not responding" errors when connecting via TCP over PPP, use the AppleShare Client Setup utility to increase the TCP Lookup Timeout from 20 seconds to the time it takes your PPP link to come up plus 20 seconds.

Question 2: Can I use a remote server alias from a Macintosh client to connect to my AppleShare IP 6 Server?

Answer: If you are receiving "Server not responding" errors when connecting via TCP over PPP, use the AppleShare Client Setup utility to increase the TCP Lookup Timeout from 20 seconds to the time it takes your PPP link to come up plus 20 seconds.

Lock the remote server's alias via its Get Info window. This will ensure that the connection information is stored correctly for the dial-up procedure. If you don't do this, you may lose this information and may not be able to access the remote server properly.

Refer to the "AppleShare Client Setup" accessible through the AppleShare IP web page in the Downloads section.

Question 3: Since the AppleShare Client uses TCP/IP to connect to the Server, why can't I connect to my Sun, NT box, or whatever using TCP/IP?

Answer: The Server must support the AFP over TCP/IP protocol, not just TCP/IP.

Question 4: Sometimes my computer stops responding when I log on via Chooser, select a volume from the volume list and click OK. Any workaround?

Answer: Try disabling the Apple Menu Options control panel on the client computer.

Question 5: My alias to an AppleShare IP server volume will not work over TCP/IP. Why is that?

Answer: If a user makes an alias to an AppleShare IP volume and uses TCP/IP to connect to that volume, both TCP/IP and AppleTalk must be active on the user's computer. Due to a limitation in the Alias Manager, AppleTalk must be active to resolve the alias.

Question 6: How can I make sure that my AppleShare Client computer mounts my server at startup using TCP/IP?

Answer: Make sure that the "Load Only When Needed" option is unchecked in the TCP/IP Control Panel Options window.Â Discard the "AppleShare Prep" file in the System folder's preferences folder. Log into the server via the Chooser again in order to recreate your startup mounts over TCP/IP. If neither of the above work, try turning on Virtual Memory.Â Open Transport may not have loaded TCP/IP due to lack of memory.

Question 7: How does the AppleShare Client software decide to use AFP over TCP/IP when connecting to a server?Â

Answer: The AppleShare client first sends a message over to the server using AppleTalk to find out if it can use TCP/IP (this command also returns the IP address of the server). The client then uses this information to establish a connection to the server over TCP/IP. Since the client obtains the IP address directly from the server, there may be issues setting up proxy services for AFP over TCP.

Question 8: I can't log on to an AppleShare IP server while connected to a different AppleShare IP. I get an "Already Connected" dialog and the AppleShare client shows the first AppleShare IP server's volumes, not the new server's login dialog.

Answer: Have the AppleShare IP server administrator check to make the sure that the server's serial number is unique. The AppleShare Client uses a server's serial number to distinguish between multiple AppleShare IP servers. What this means, in practice, is that, if you have logged into a AppleShare IP server, you cannot log into a different AppleShare IP server with the same serial number. The AppleShare Client will get the "Already Connected" dialog instead of the newly selected AppleShare IP server's login dialog. Startup mounting will behave oddly as well.

Question 9: Is AppleShare Client 3.8 compatible with RunShare?

Answer: It is compatible with RunShare v3.0 or later.

iMac Discussion Board: Frequently Asked Questions (2 of 2)

This document contains frequently asked questions (FAQ) regarding iMac, with answers to those questions, and information regarding technical issues that may be encountered with an iMac. Additional iMac Discussion FAQs are listed at the end of this technical document.
This article has been archived and is no longer updated by Apple.
Questions answered in this document:

1. Some of my menu options, such as Sleep, Restart, Get Info, and View Options are no longer listed. What is causing this symptom?
2. What type of random-access memory (RAM) and video random-access memory (VRAM) do I need for my iMac?
3. How do I upgrade the memory in my iMac?
4. Why is there a hole in the iMac I/O door?
5. My iMac modem dials automatically. How do I get it to stop?
6. How do I change my default browser and email application?
7. How do I register the ClarisWorks application that came with my iMac?
8. What books do you recommend to learn about Macintosh computers in general, Mac OS, and iMac?
9. Certain CD-ROM discs make a vibrating noise when used in my iMac. What is causing this noise and how can I eliminate it?
10. I am having some difficulty in connecting to my Internet service provider (ISP). Sometimes I connect successfully, but the connection is dropped after a few minutes. What can I do to resolve this issue?
11. I get intermittent situations where my iMac stops responding and I receive type xx errors. What should I do?
12. Where can I get the software updates mentioned here?

Question 1: Some of my menu options, such as Sleep, Restart, Get Info, and View Options are no longer listed. What is causing this symptom?

Answer: Refer to the following technical documents:

- technical document 30157: "**Mac OS 8: No Sleep Choice in Special Menu**"
- technical document 58047: "**Mac OS 8.5: Keyboard Commands Disabled by Simple Finder**"

Question 2: What type of random-access memory (RAM) and video random-access memory (VRAM) do I need for my iMac?

Answer: Refer to the following technical documents:

- technical document 58007: "**iMac: Type of Memory to Order to Upgrade RAM and VRAM**"
- technical document 43011: "**iMac: About Memory, DRAM and Video Memory Configurations**"

Question 3: How do I upgrade the memory in my iMac?

Answer: Refer to the following technical documents:

- technical document 58466: "**iMac (Slot Loading): Memory: Specifications and Upgrades**"
- technical document 43012: "**iMac: Installing Memory (1 of 2)**"
- technical document 43013: "**iMac: Installing Memory (2 of 2)**"

Question 4: Why is there a hole in the I/O door?

Answer: The hole is for using a finger to open the door.

- technical document 58055: "**iMac: Hole in I/O Door Not For Cables**"

Question 5: My modem dials automatically. How do I get it to stop?

Answer: There are numerous settings to automate a connection to the Internet. Most settings are listed in the following technical document:

- technical document 24877: "**Modem Dials Automatically**"

Question 6: How do I change my default browser and email application?

Answer: Apple recommends using the Internet control panel.

- technical document 58041 "**iMac: Changing Internet Settings and Applications**"

If you choose to use Internet Config instead of the Apple Internet control panel use the latest version of Internet Config.

Review the following technical documents for further tips:

- technical document 24679: "**Mac OS 8.5: Internet Control Panel or Internet Config?**"
- technical document 24676: "**Mac OS 8.5: Mac OS Help Crashes With Type 3 Error**"
- technical document 58168: "**Mac OS 8.5: Error Opening Internet Control Panel or File Exchange**"

- technical document 24736: "**Sherlock: Internet Config Conflict**"

Question 7: How do I register the ClarisWorks application that came with my iMac?

Answer: technical document 30702: "**iMac: ClarisWorks Registration Information**"

Question 8: What books do you recommend to learn about Macintosh computers in general, Mac OS, and iMac?

Answer: Your local book store has many excellent books covering those subjects. Here are a few books recommended by other Macintosh users.

- "The Little Mac Book"
- "Sad Macs, Bombs, and Other Disasters : And What to Do About Them"
- "Beyond the Little Mac Book"
- "The Little iMac Book"
- "The Macintosh Bible (Bible Series)"
- "Mac OS 8.5 for Dummies (For Dummies)"
- "The Complete Idiot's Guide to Macintosh OS 8.5"
- "Mac Answers!"

Here are some iMac-specific titles:

- "The iMac for Dummies"
- "Sam's Teach Yourself iMac in 10 Minutes"
- "The iMac Book "
- "Quick Start Your iMac Training CD - Macintosh (1 of 1) Vol. 1"

Question 9: Certain CD-ROM discs make a vibrating noise when used in my iMac. What is causing this noise and how can I eliminate it?

Answer: It is normal to get a slight vibrating noise with certain CD-ROM discs when using a high-speed CD-ROM drive like the drive in the iMac. The artwork on a CD-ROM disc may cause the CD's center of gravity to be slightly off center. Because the CD is spinning at such a fast rate, the CD will wobble, which in turn causes a slight vibration. This is perfectly normal and does not damage your computer or CD-ROM drive in any way.

If you are using a CD with a removable, sticky label, remove the label prior to using the CD.

Also install iMac CD Update 2.0. This software update improves the way the CD-ROM drive handles unbalanced CD-ROM discs. It may reduce the amount of vibration for most CD-ROM discs.

The software is available from the Apple Software Updates Web site at http://www.apple.com/swupdates.

- technical document 20233: "**Macintosh Computers: 8x-Speed (or faster) CD-ROM Drive & Vibration**"

Question 10: I am having some difficulty in connecting to my Internet service provider (ISP). Sometimes I connect successfully, but the connection is dropped after a few minutes. What can I do to resolve this issue?

Answer: Refer to the following technical documents:

- technical document 30893: "**iMac: Troubleshooting Modem Not Responding Error**"
- technical document 24789: "**iMac: Troubleshooting "No Dial Tone"**"
- technical document 24803: "**iMac: Troubleshooting Unreliable Modem Connections**"
- technical document 58046: "**iMac: ISP Compatibility With v.90 Specification**"
- technical document 30734: "**V.90 Protocol: Connectivity Discussion**"
- technical document 24482: "**56Kbps Modems: Getting the Fastest Connection**"

Question 11: I get intermittent situations where the computer stops responding and I receive type xx errors. What should I do?

Answer: For information on troubleshooting these situations, refer to page 9 of the Emergency Handbook provided with your iMac. Also refer to technical document 16473: "**Mac OS: Troubleshooting Startup Problems**"

Question12: Where can I get the software updates mentioned here?

Answer: The following technical document can help you locate the Apple software updates mentioned here 14724: "**Where To Find Apple Software Updates**" Lists online services for free Apple software updates. To locate iMac specific updates search "iMac."

Part 1 of this FAQ can be found in technical document 30808: "iMac Discussion Board: Frequently Asked Questions (1 of 2)

AppleShare IP 6: Server and Client Requirements

This article provides the server and client requirements for Appleshare IP 6.
This article has been archived and is no longer updated by Apple.

Server Requirements:

- Any Power Macintosh or Apple Macintosh Servers based on PowerPC 601, 604, 604e, or G3 processors. The Power Macintosh 6500 series (603e processor), has also been tested and qualified as an ASIP server.
- Mac OS 8.1 or later with Open Transport 1.3 or later, and OpenDoc 1.2.1.
- 48 MB of RAM with virtual memory turned on (64MB with VM turned off.)

All AppleShare IP services do not need to run on the same computer. In fact, it is recommended that certain services be divided amongst different computers for optimum performance.

Web, File, FTP and SMB services are all provided by the Web & File Server application and must run on the same system.

ASIP Print Server can run independently of other services. (Personal File Sharing cannot be enabled on the Print Server, since the Users & Groups Data File is modified for use with the Print Server.)

ASIP Mail Server can run independently of other services.

MacDNS can run independently of all ASIP services. System requirements are a 68020 processor or Power PC processor, 1500K of free memory, a TCP/IP connection with static IP address, System 7 or later (7.5.3 recommended), MacTCP 2.0.6 or OT 1.1 or later.

Client Requirements:

For logging onto the file server via Appletalk:

- Macintosh Clients

  Recommended: Mac OS 8.1, Open Transport 1.3, AppleShare client 3.8. The AppleShare client 3.8 has minimum system requirements of System Software version 7.6 and OT 1.1.2.

  Older versions of AppleShare client software will provide basic functionality, but may not support new features, such as the ability to cancel a connection that is taking too long (3.8 required), to connect via AFP over TCP/IP (3.7 required), or to receive messages from the server (3.0 required).

- Windows Clients

  Windows 3.x and 95 clients need an AppleTalk file sharing client (such as CopsTalk or MacLAN Connect).

For logging onto the file server via TCP/IP

- Macintosh Clients

  Recommended: Mac OS 8.1, Open Transport 1.3, AppleShare client 3.8.

  Minimum: System Software 7.5.3, Open Transport 1.1.2, AppleShare Client 3.7.

For logging onto the file server via SMB:

- Windows Clients

  Windows 95/98
  Windows NT 3.5.1/4.0/5.0
  Windows for Workgroups 3.1.1

- Unix clients

  Samba

  AppleShare IP only supports SMB via TCP/IP.

For accessing Web or FTP services:

- All Clients:

  Your favorite Web browser or FTP client. There are no special requirements for accessing ASIP servers.

For printing using AppleTalk:

- Macintosh clients:

  LaserWriter driver 7.x or 8.x for Macintosh clients.

- Windows Clients

  An AppleTalk LW driver. (As of this writing, Windows NT printer drivers do not support printing to a secure queue. See the Related Topic on Print Server security for a more detailed explanation.)

For printing using TCP/IP:

- Macintosh Clients:

  Desktop Printer Utility version 1.0 or greater (installed with Mac OS 8.1, and with LW Driver 8.5.1.)

- Non-Mac Clients:

  Most LPR clients are compatible.

For accessing mail:

- All clients

  Third-party mail clients that support either POP3 or IMAP.

PowerBook G3 Series: Design Elements FAQ, Part 2

This article contains the following PowerBook G3 Series frequently asked questions (FAQ) regarding its design elements, with answers to those questions.

Note that they pertain to the PowerBook G3 Series models that were released in September, 1998.

For Part 1 of this article, see Article 24613: "**PowerBook G3 Series: Design Elements FAQ, Part 1**"

See also the following Frequently Asked Questions articles pertaining to the September 1998 models of the PowerBook G3 Series computer:

Article 24608: "**PowerBook G3 Series: General FAQ**"
Article 24610: "**PowerBook G3 Series: Battery FAQ**"
Article 24611: "**PowerBook G3 Series: Features, Configurations, Performance FAQ**"
Article 24612: "**PowerBook G3 Series: Memory FAQ**"
Article 24614: "**PowerBook G3 Series: Video, Graphics, And Sound FAQ**"
Article 24615: "**PowerBook G3 Series: DVD, CD-ROM, and Hard Drive FAQ**"
Article 24616: "**PowerBook G3 Series: Communications FAQ**"

This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. How much does the PowerBook G3 Series computer weigh?
2. What are the overall dimensions of the PowerBook G3 Series computer?
3. Does the PowerBook G3 Series computer's trackpad have "tap, double tap" functionality?
4. Does the PowerBook G3 Series computer's panel come off?
5. Is there a docking station for the PowerBook G3 Series computer?
6. Does the PowerBook G3 Series computer have a fan?
7. Why is the palm rest area of a PowerBook G3 Series computer so big?
8. What interfaces does the PowerBook G3 Series computer have?

Question 1: How much does the PowerBook G3 Series computer weigh?

Answer: The system weight varies depending on the screen and expansion bay modules. Here are the weights for the three screen types with a battery in one expansion bay and a CD-ROM module in the other expansion bay:12.1-inch screen: 7.2 pounds; 14.1-inch screens: 7.8 pounds.

Question 2: What are the overall dimensions of the PowerBook G3 Series computer?

Answer:

Width: 12.7 inches (32.3 cm)

Height: 2.0 inches (5.1 cm; 5.3 cm for the 14.1-inch model)

Depth: 10.4 inches (26.4 cm)

Question 3: Does the PowerBook G3 Series computer's trackpad have "tap, double tap" functionality?

Answer: Yes, you activate it through the Trackpad control panel.

Question 4: Does the PowerBook G3 Series computer's panel come off?

Answer: Neither the top nor the bottom panel, where you see the Apple logo, comes off. These panels provide rigidity for the system.

Question 5: Is there a docking station for the PowerBook G3 Series computer?

Answer: Apple will not be providing a docking station or port replicator for the PowerBook G3 Series. Newer Technologies (www.newertech.com) has announced their G3 BookEndz port replicator for the PowerBook G3.*

Question 6: Does the PowerBook G3 Series computer have a fan?

Answer: Yes, it does have a fan, but the system is designed with many heat dissipation features and it is unlikely that the fan will turn on unless the system is in extreme temperature situation.

Question 7: Why is the palm rest area of a PowerBook G3 Series computer so big?

Answer: Apple has advocated a keyboard-forward design in the PowerBook for a long time. Because of the overall dimensions of the new system, we had more room to create a larger palm rest area below the keyboard. This helps users place their hands in a more comfortable typing position.

Question 8: What interfaces does the PowerBook G3 Series computer have?

Answer: It includes Apple Desktop Bus (ADB), high-speed serial (RS-422), SCSI (HDI-30), 10BASE-T Ethernet (RJ-45), 24-bit video output (VGA-style connector), S-video output (14.1-inch configurations only), 16-bit stereo input/output, power adapter port, modem (RJ-11), infrared connectors (4 -Mbps IrDA), and two Type I or Type II or one Type III PC or CardBus cards slots (supports Zoomed Video in lower slot).

***Note**: This article contains information about third party products. This article is provided for informational purposes only and Apple makes no guarantees about the information contained in this article. Furthermore, Apple technical support does not supply support for the use of third party products)

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"

Published Date: Feb 20, 2012

PowerBook G3 Series: Video, Graphics, And Sound FAQ, Part 2

This article contains the following PowerBook G3 Series frequently asked questions (FAQ) regarding video, graphics, and sound, with answers to those questions.

Note that they pertain to the PowerBook G3 Series models that were released in September, 1998.

For Part 1 of this article, see Article 24614: **"PowerBook G3 Series: Video, Graphics, And Sound FAQ, Part 1"**

See also the following Frequently Asked Questions articles pertaining to the September 1998 models of the PowerBook G3 Series computer:

Article 24608: "**PowerBook G3 Series: General FAQ**"
Article 24610: "**PowerBook G3 Series: Battery FAQ**"
Article 24611: "**PowerBook G3 Series: Features, Configurations, Performance FAQ**"
Article 24612: "**PowerBook G3 Series: Memory FAQ**"
Article 24613: "**PowerBook G3 Series: Design Elements FAQ**"
Article 24615: "**PowerBook G3 Series: DVD, CD-ROM, and Hard Drive FAQ**"
Article 24616: "**PowerBook G3 Series: Communications FAQ**"

This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. Who makes the displays for PowerBook G3 Series computers?
2. Are the possible resolutions displayed when you connect a video output device to PowerBook G3 Series computers?
3. Is the sound output of PowerBook G3 Series computers comparable to that of the PowerBook 3400, which had four speakers?
4. Do PowerBook G3 Series computers have a subwoofer like the PowerBook 3400?
5. Can you add speakers or a microphone to PowerBook G3 Series computers?
6. How does the mute button work on PowerBook G3 Series computers?
7. If you activate the mute button, do PowerBook G3 Series computers mute the system startup sounds?

Question 1: Who makes the displays for PowerBook G3 Series computers?

Answer: As a general rule, we do not reveal the names of our commodities vendors. However, rest assured that we source products from the top vendors in the industry and our 14-inch display has been recognized as one of the sharpest and brightest available.

Question 2: Are the possible resolutions displayed when you connect a video output device to PowerBook G3 Series computers?

Answer: Yes, if you open the resolution panel in the control strip, you will see the possible resolutions.

Question 3: Is the sound output of PowerBook G3 Series computers comparable to that of the PowerBook 3400, which had four speakers?

Answer: Yes, the sound is comparable, and many of our customers have indicated that the sound is even better.

Question 4: Does a PowerBook G3 Series computer have a subwoofer like the PowerBook 3400?

Answer: No, it does not have a subwoofer.

Question 5: Can you add speakers or a microphone to PowerBook G3 Series computers?

Answer: Yes, you can attach speakers or a microphone to the PowerBook G3 Series computer via the stereo input and output ports located next to the power adapter plug on the back right-hand side of the computer. An external audio source may be used if it generates line-level output. To input sound from audio equipment with line-level output, you may need the appropriate adapters, which are available from most electronic stores. The Apple PlainTalk Microphone may be used with the PowerBook G3 Series but the Apple Omni Microphone is not compatible with this computer.

Question 6: How does the mute button work on PowerBook G3 Series computers?

Answer: The mute button, located just above the keyboard, works just like a light switch. You turn it on or off with one touch.

Question 7: If you activate the mute button, do PowerBook G3 Series computers mute the system startup sounds?

Answer: Yes.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3**

Series: Identifying Different Versions"

AppleWorks 6: Using DataViz Translators

This article explains how to use the DataViz translators with AppleWorks 6.
This article has been archived and is no longer updated by Apple.
While AppleWorks 6.0 and AppleWorks 6.0.4 do not include the DataViz MacLinkPlus translators, they are available with the AppleWorks 6.1 Update.

These translators allow you to open, import, and save documents in additional file formats. Only those file formats for which you have the appropriate translator can be opened, imported, or saved.

You can download the AppleWorks 6.1 Updater from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Power Mac G4 Cube: Troubleshooting: Power: Power Button Lights Up, But Computer Does Not Turn On

The DC-to-DC converter card in the Power Mac G4 Cube computer may move slightly out of its connector during shipping, causing the computer not to turn on when the power button is touched. This article explains how to reinsert the card to correct this issue.
This article has been archived and is no longer updated by Apple.

Symptom

The computer's power button lights up when touched, but goes out as soon as you remove your finger, and the computer does not turn on.

Note: You may also notice the Power Mac G4 Cube starting up or shutting down by itself.

Product affected

Power Mac G4 Cube

Solution

Sometimes the DC-to-DC converter card may move slightly out of its connector during shipping, causing the computer not to turn on when the power button is touched. To correct this, the card needs to be pressed firmly back into its slot.

Warning: Read and follow the ESD precautions outlined in the 'Working Inside Your Computer' section of the "About the Power Mac G4 Cube" owners manual.

To reinsert the DC-to-DC converter into its connector, follow these steps:

1. Shut down the computer.
2. Remove all cables connected to the computer.
3. Remove the computer's core from the its enclosure by turning it upside-down on a soft surface, and pushing down on the latch.

Figure 1. Removing core

4. Turn the computer so the video card is on top.
5. Find the DC-to-DC converter card (pictured below in Figure 2).
6. Push down on the card to ensure it is securely in its connector.

Figure 2. Pushing the DC-to-DC converter

7. As shown in the photo, make sure the latch on the connector the card sits in is secure in the notch of the card.

Figure 3. Latch on connector

8. Reinsert the core back into the enclosure, and push down on the latch until it locks into place.
Note: The core fits into the enclosure only one way. The ports should face the back of the enclosure.

Figure 4. Reinserting core

9. Turn on the computer.

For further troubleshooting, refer to the troubleshooting section in the "About the Power Mac G4 Cube" owners manual.

iBook (FireWire) and iBook (Dual USB): Composite Video Cable Not Interchangeable With Similar Cables

The composite video cable used with the iBook (FireWire) and iBook (Dual USB) computers is not interchangeable with similar cables that come with some video cameras.
This article has been archived and is no longer updated by Apple.
A cable similar to the composite video cable used with the iBook computer is available from electronics vendors and is included with some video camcorders.

Figure 1 Apple A/V cable

These cables are not interchangeable with the Apple A/V cable for use with the iBook (FireWire) or iBook (Dual USB). Using a third-party cable with these computers will likely result in a distorted audio signal and no video output to the external monitor.

iBook (FireWire): How to View Video On an External Monitor or TV

You can use the composite video out port of an iBook (FireWire) computer to view video on an external television or monitor. This article explains how to select a composite video resolution that is compatible with your TV or monitor.
This article has been archived and is no longer updated by Apple.
You can use the composite video out port of an iBook (FireWire) computer to view video on an external television or monitor. Follow these steps to select a composite video resolution that is compatible with your TV or monitor:

1. Connect the composite video cable to the composite video out port.

2. Connect the composite video cable to a television or monitor.

3. Open the Monitors control panel.

4. Click Monitor. The following choices are available in the Resolution section:

640 x 480, 60 Hz (simulscan NTSC)
800 x 600, 60 Hz (simulscan, NTSC)
640 x 480, 50 Hz (simulscan PAL)
800 x 600, 50 Hz (simulscan, PAL)
640 x 480
800 x 600

5. Click the appropriate resolution and standard (NTSC or PAL) for your TV or monitor.

Figure 1 TV Monitor Control Panel

6. If the image on the TV or monitor is rolling the resolution or standard you selected is not compatible with the TV or monitor. Select a different resolution or standard until you find one that works.

Note: The simulscan options allow you to view the same image on the television or monitor that you see on the iBook's screen.

Power Mac G4 Cube: Troubleshooting: Power: Random Activation of the Power Button

This article describes how a small number of Power Mac G4 Cube computers may self-activate the power switch.
This article has been archived and is no longer updated by Apple.

Power Switch Information

The power button of the Power Mac G4 Cube computer is designed to function by sensing changes of static capacitance when a finger touches it. Pressing the power button when:

- the computer is off will turn it on.
- the computer is on and awake will put it to sleep.
- the computer is on and in sleep mode will awaken it.
- the computer is on and awake or in sleep mode will cause the computer to shut down if held for at least five seconds.

Symptom

A small number of Power Mac G4 Cube computers may exhibit the following symptoms without user interaction:

- If the computer is on, it may turn off or go to sleep.
- If the computer is off, it may turn on or wake up.

Solution

If your computer is experiencing any of the above symptoms, try the following steps:

1. Make sure the computer is on a sturdy, flat surface.
2. Make sure there is nothing on the top of the Power Mac G4 Cube computer.
3. Check the settings in the Energy Saver control panel. The computer may be in sleep mode according to these settings.
4. Verify the power adapter is plugged securely into the Power Mac G4 Cube computer.
5. Verify the A/C power cord is plugged securely into the wall socket and the power adapter.
6. Remove and reinstall the DC-to-DC Converter card.

   For assistance with this step, review article 88037: "**Power Mac G4 Cube: Power Switch Lights up, but Computer Does Not Turn On**".

7. The computer may require the replacement of the power button gasket. Contact Apple to determine if a gasket replacement is appropriate for your computer.

If following the above steps do not solve the issue, contact Apple for further troubleshooting assistance.

iBook (FireWire): Does Not Operate When the Computer Is Closed

The iBook (FireWire) computer does not operate when the computer is closed.
This article has been archived and is no longer updated by Apple.
Some PowerBook computers are able to operate when the computer is closed and a monitor, mouse and keyboard are connected to them.

Although you can connect a keyboard, mouse and TV or monitor to an iBook (FireWire) computer, it was not designed to operate when closed. If you try to use the iBook (FireWire) computer in this way, the computer will wake up when you connect a USB keyboard, the desktop will show on the external monitor, but it will immediately go back to sleep.
